

Contents

Chapter 1. Introduction	1
1.1. Background and motivation	1
1.2. Summary of results	2
1.3. Proof ideas	3
Chapter 2. The setup	9
2.1. Nearest-neighbour models	9
2.2. Long-range models	9
Chapter 3. Definitions and preliminaries	11
3.1. Graph theoretic definitions	11
3.2. Exponential tail of the subcritical cluster size distribution: The Aizenman-Newman-Barsky property	11
3.3. The BK inequality	12
3.4. Partitions of integers	12
Chapter 4. The basic technique	15
4.1. Nearest-neighbour models	15
4.2. Long-range models	17
4.3. Analyticity of susceptibility in the subcritical regime	19
Chapter 5. Analyticity for non-amenable graphs	23
Chapter 6. Trees	25
6.1. Regular trees	25
6.2. Galton-Watson trees	25
6.3. A tree with percolation density nowhere analytic	29
Chapter 7. Analyticity above the threshold for planar lattices	31
7.1. Preliminaries on planar quasi-transitive lattices	32
7.2. Main result	33
7.3. Site percolation	37
Chapter 8. Analyticity of percolation density in all dimensions	39
8.1. Setting up the renormalisation	39
8.2. Separating components	40
8.3. Expressing the percolation density using separating components	41
8.4. Expanding the percolation density as an infinite sum of polynomials	44
8.5. Exponential tail of a certain cutset	45
8.6. Analyticity of k-point function	46
Chapter 9. Continuum percolation	51

Chapter 10. Finitely presented groups	63
10.1. The setup and notation	64
10.2. A connectedness concept	65
10.3. Interfaces	66
10.4. Properties of interfaces	67
10.5. Using interfaces to prove analyticity	71
10.6. Extending to site percolation	73
Chapter 11. Triangulations	77
11.1. Overview	77
11.2. Proofs	78
11.3. Site percolation	83
Chapter 12. Alternating signs of Taylor coefficients	85
Chapter 13. The negative percolation threshold	91
Appendix A. On the number of lattice animals of a given size	95
Appendix B. Complex analysis basics	97
Bibliography	99
