

# Contents

Chapter 1. Introduction	1
1.1. Background	1
1.2. Construction	2
1.3. Comparisons	3
1.4. Future work	3
1.5. Structure of the paper	4
1.6. Conventions and notations	4
Chapter 2. Overview of the construction	5
2.1. Input data	5
2.2. Landau–Ginzburg quasimaps	6
2.3. Stability conditions and moduli of stable LG maps	7
2.4. Hybrid models	8
2.5. The plan	10
Chapter 3. Factorizations	13
3.1. Derived categories of Landau–Ginzburg models	13
3.2. Derived functors	15
3.3. Koszul factorizations	19
3.4. Hochschild Homology	20
3.5. Comparisons	22
Chapter 4. Admissible resolutions of GLSMs	29
4.1. Setup	29
4.2. Admissible resolutions	33
4.3. Definition of the Polishchuk–Vaintrob factorization	37
4.4. On Condition 1	38
4.5. On Conditions 2 and 3	39
4.6. Support of the PV factorization	43
4.7. $R$ -charge equivariance	50
Chapter 5. Construction of a projective embedding	53
5.1. Convexity	53
5.2. Quasi-projective embeddings	54
5.3. Properties of moduli of LG maps	58
Chapter 6. The GLSM theory for convex hybrid models	63
6.1. The Fundamental Factorization	63
6.2. Independence of choices	66
6.3. Rigidified evaluation and the state space	73
6.4. The restricted state space	74

6.5. GLSM invariants	75
Chapter 7. Comparisons with other constructions	79
7.1. Comparison with Gromov–Witten theory and cosection localization	79
7.2. Comparison with the Polishchuk–Vaintrob construction	86
7.3. Comparison with other affine phases	90
Bibliography	93
