

Contents

Preface	vii
Chapter 1. Related Topics	1
1. Some facts of functional analysis	1
2. Some facts of ergodic theory and stochastic analysis	15
3. Elasticity system	22
4. Stokes equations	32
Chapter 2. Homogenization Methods	39
5. Compensated compactness	39
6. Homogenization of equations with random coefficients	47
7. Two-scale asymptotic expansion method	49
8. p -Connectedness technique (in the sense of V. V. Zhikov)	58
9. Two-scale convergence method	67
10. Homogenization of thin structures and singular measures	82
11. Method of matching asymptotic expansions	105
12. The Bogolyubov method	123
Chapter 3. Applications of Homogenization Methods	137
13. Homogenized equations with periodic coefficients. Composite materials	137
14. Filtration of viscous incompressible fluid through a porous medium. The Darcy law.	140
15. Boundary value problems with rapidly alternating type of boundary conditions	158
16. Appearance of a potential (or étrange term) in the homogenized equation	168
17. Parabolic equations in media with rapidly pulsating perforation	181
18. Homogenization of nonautonomous parabolic equations with random coefficients	192
Bibliography	227
Index	233
