Preface to the English Edition	vii
Chapter 5. What is Class Field Theory?	1
5.1. Examples of class field theoretic phenomena	1
5.2. Cyclotomic fields and quadratic fields	13
5.3. An outline of class field theory	25
Summary	31
Exercises	31
Chapter 6. Local and Global Fields	33
6.1. A curious analogy between numbers and functions	33
6.2. Places and local fields	40
6.3. Places and field extension	52
6.4. Adele rings and idele groups	83
Summary	107
Exercises	108
Chapter 7. ζ (II)	111
7.1. The emergence of ζ	112
7.2. Riemann ζ and Dirichlet L	115
7.3. Prime number theorems	120
7.4. The case of $\mathbb{F}_p[T]$	130
7.5. Dedekind ζ and Hecke L	132
7.6. Generalization of the prime number theorem	142
Summary	148
Exercises	149
Chapter 8. Class Field Theory (II)	151
8.1. The content of class field theory	152
8.2. Skew fields over a global or local field	174
8.3. Proof of the class field theory	187
Summary	212

Exercises	213
Appendix B. Galois Theory	215
B.1. Galois theory	215
B.2. Normal and separable extensions	217
B.3. Norm and trace	219
B.4. Finite fields	220
B.5. Infinite Galois theory	220
Appendix C. Lights of Places	223
C.1. Hensel's lemma	223
C.2. The Hasse principle	225
Answers to Questions	227
Answers to Exercises	231
Index	239
