Preface	vii
Chapter 1. Preliminaries	1
1.1. Frequently used notation and conventions	1
1.2. Normed finite-dimensional vector space	1
1.3. Lemmas on the length of modules	6
1.4. Image of a homomorphism and its determinant	11
1.5. Norm of flat and finite homomorphisms	15
1.6. Principal divisor and Weil's reciprocity law	17
1.7. Existence of rational sections not passing through given points	22
1.8. Graded modules and ample invertible sheaves	24
1.9. Several results on separable extensions of the base field	26
1.10. Determinant bundle	28
1.11. Complex manifold and Hodge theory	31
1.12. Connection and curvature	35
1.13. Poincaré-Lelong formula	36
1.14. $C^\infty$ on reduced complex space	39
Chapter 2. Geometry of Numbers	41
2.1. Convex set and Minkowski's theorem	41
2.2. Polar dual set and Mahler's inequality	44
2.3. The Brunn-Minkowski theorem	45
2.4. Estimate of the number of points in a convex lattice	48
2.5. Normed finitely generated $\mathbb{Z}$ -module	55
2.6. $\lambda_{\mathbb{Q}}$ and $\lambda_{\mathbb{Z}}$	58
Chapter 3. Arakelov Geometry on Arithmetic Curves	63
3.1. Orders	63
3.2. Arithmetic Chow group over a reduced order	69
3.3. Hermitian $R$ -module	70
3.4. Arithmetic Riemann-Roch formula on arithmetic curves	74
3.5. Effective estimate of the number of small sections	77
3.6. Several formulae on arithmetic degree	80
3.7. Volume exactness	83
3.8. Ample invertible sheaves on arithmetic curves	84
Chapter 4. Arakelov Geometry on Arithmetic Surfaces	87
4.1. Deligne's pairing	87
4.2. Green functions on Riemann surfaces	95
4.3. Arithmetic Chow groups on arithmetic surfaces	101

4.4.	Intersection theory on arithmetic surfaces	104
4.5.	Arakelov metric of dualizing sheaf and adjunction formula	110
4.6.	Determinant bundles for curves	114
4.7.	Faltings' Riemann-Roch theorem on arithmetic surfaces	119
4.8.	Determinant bundle and theta divisor	124
4.9.	Existence of Faltings' metric	129
Chapter 5.	Arakelov Geometry on General Arithmetic Varieties	141
5.1.	Preliminaries on algebraic geometry and complex geometry	141
5.2.	Intersection theory of Cartier divisors on excellent schemes	146
5.3.	Higher dimensional generalization of Weil's reciprocity law in complex geometry	150
5.4.	Intersection theory on arithmetic varieties	155
5.5.	Characteristic classes and Bott-Chern secondary characteristic form	166
5.6.	Arithmetic characteristic classes	171
5.7.	Arithmetic Riemann-Roch formula	174
5.8.	Multi-indexed version of Gromov's inequality	175
5.9.	Arithmetic Hilbert-Samuel formula	180
5.10.	Several kinds of positivity of $C^\infty$ -hermitian invertible sheaves	185
5.11.	Estimation of $\lambda_{\mathbb{Q}}$ for a normed graded ring	190
Chapter 6.	Arithmetic Volume Function and Its Continuity	197
6.1.	Arithmetic volume function	197
6.2.	Extension of volume function over $\mathbb{Q}$	202
6.3.	Continuity of volume function	204
6.4.	Generalized Hodge index theorem	208
6.5.	Estimate of the number of small sections	212
Chapter 7.	Nakai-Moishezon Criterion on an Arithmetic Variety	225
7.1.	Endmorphism $N$ and its basic properties	225
7.2.	Bounded extension of holomorphic sections	228
7.3.	Proof of Nakai-Moishezon's criterion on an arithmetic variety	234
7.4.	Arithmetic Hilbert-Samuel formula	235
Chapter 8.	Arithmetic Bogomolov Inequality	237
8.1.	Semistable locally free coherent sheaves on algebraic curves	237
8.2.	Hermite-Einstein metric and stability	239
8.3.	Arithmetic Bogomolov inequality and its proof	243
Chapter 9.	Lang-Bogomolov Conjecture	249
9.1.	Height function	249
9.2.	Height function on abelian variety	256
9.3.	Equidistribution theorem	259
9.4.	Cubic metric on complex abelian variety	263
9.5.	Bogomolov's conjecture	265
9.6.	The Lang-Bogomolov Conjecture	269
9.7.	Small points with respect to a subgroup of finite rank	270
9.8.	The proof of Theorem 9.24	275
