

TABLE DE MATIÈRES

Préface	vii
1. Genèse et grandeur de <i>Pursuing Stacks</i>	vii
2. Le travail d'édition de <i>Pursuing Stacks</i>	xi
3. Le style d'écriture de Grothendieck dans <i>Pursuing Stacks</i>	xii
4. La structure de <i>Pursuing Stacks</i> en sections et chapitres	xv
5. La chronologie de <i>Pursuing Stacks</i>	xvi
6. Remerciements	xviii
Introduction	xxi
1. Les ∞ -groupoïdes faibles, alias ∞ -champs	xxii
2. Les catégories test	xxxviii
3. Structures homotopiques	lxiv
4. Structures d'asphéricité	lxxi
5. La théorie homotopique des catégories avant et après <i>Pursuing Stacks</i> ...	lxxxii
Résumés section par section	xci
Réflexions Mathématiques – par Alexandre Grothendieck	cix
Pursuing Stacks	cxi
The Modelizing Story	cxv
Table of contents of <i>The Modelizing Story</i>	cxvii
I. The take-off	1
1. The importance of innocence	1
2. A short look into purgatory	2
3. “Fundamental ∞ -groupoids” as objects of a “model category”?	6
4. A bit of ordering in the mess of “higher order structures”	7
5. Jumping over the abyss!	9

6. The topological model: hemispheres building up the (tentative) “universal ∞ -(co)groupoid”	11
7. Gluing hemispheres: the “standard” amalgamations	13
8. Description of the universal <i>primitive</i> structure	15
9. The main inductive step: just add coherence arrows! And the abridged story of an (inescapable and irrelevant) ambiguity	15
10. Cutting down redundancies – or: “l’embarras du choix”	17
11. Back to the topological model. The canonical functor from spaces to “ ∞ -groupoids”	19
12. About replacing spaces by objects of a “model category”	20
13. An urgent reflection on proper names: “stacks” and “coherators”	21
II. Test categories	25
14. The unnoticed failure (of the foundations of topology)	25
15. Overall review on standard descriptions of homotopy types	26
16. Stacks over topoi as the unifying concept for homotopical and cohomological algebra	30
16’. Categories as models for homotopy types. First glimpse upon an “impressive bunch” (of modelizers)	32
17. The Artin-Mazur cohomological criterion for weak equivalences	35
18. Corrections and comments to letter. Bénabou’s lonely approach	35
19. Beginning of a provisional itinerary (through stacks)	37
20. Are model categories sites?	40
21. Further glimpse upon the “bunch” of possible model categories, and a relation between n -complexes and n -stacks	41
22. Ordered sets as models for homotopy types	43
23. Getting a basic functor $M \rightarrow (\text{Hot})$ from a site structure M (the faltering beginning of a systematic reflection)	46
24. A bunch of topologies on (Cat)	49
25. A tentative equivalence relation for topologies	51
26. The dawn of test categories and test functors	53
27. Digression on “geometric realization” functors	57
28. The “inspiring assumption”. Modelizers	58
29. The basic modelizer (Cat) . Provisional definition of test categories and elementary modelizers	62
30. Starting the “asphericity game”	66
31. The end of the thin air conjecturing: a criterion for test categories	68
32. Provisional program of work	71
33. Necessity of conditions T1 to T3	72
34. Examples of test categories	77
35. The notion of a modelizing topos. Need for revising the Čech-Verdier-Artin-Mazur construction	80
36. Characterization of (a particular type of) test functors with values in (Cat)	85
37. The “asphericity story” told anew – the “key result” on test functors	87

38. Asphericity story retold (continued): generalized nerve functors	92
39. Returning upon terminology: strict test categories, and strict modelizers	96
40. Digression on cartesian products of weak equivalences in (Cat); weak equivalences <i>relative</i> to a given base object	99
41. Role of the “inspiring assumption”, and of saturation conditions on “weak equivalences”	101
42. Terminology revised (model-preserving functors). Submodelizers of the basic modelizer (Cat)	102
43. The category Δ^f of simplices without degeneracies as a weak test category – or “face complexes” as models for homotopy types	104
44. Overall review of the basic notions	108
a) Weak test categories	109
b) Test categories and local test categories	111
c) Strict test categories	113
d) Weak test functors and test functors (with values in (Cat))	114
III. Homotopy structures	119
45. It’s burning again! Review of some “recurring striking features” of modelizers, and of standard modelizing functors	119
46. Test functors with values in any modelizer: an observation, and an inspiring “silly question”	123
47. An approach for handling (Cat)-valued test functors, and promise of a “key result” revised. The significance of contractibility	125
48. A journey through abstract homotopy notions (in terms of a set W of “weak equivalences”)	128
49. Contractible objects. Multiplicative intervals	136
50. Reflection on some main impressions. The foresight of an “idyllic picture” (of would-be “canonical modelizers”)	139
51. The four basic “pure” homotopy notions and their interplay (a fugue with variations . . .)	140
A) Homotopy relation between maps	141
B) Homotopisms, and homotopism structures	143
C) Homotopy interval structures	145
D) Contractibility structures	147
E) Generating sets of homotopy intervals. Two standard ways of getting multiplicative intervals. Contractibility of $\underline{\text{Hom}}(X, Y)$ ’s	149
F) The canonical homotopy structure: preliminaries on π_0	152
52. Inaccuracies rectified	154
53. Compatibility of a functor $u: M \rightarrow N$ with a homotopy structure on M	159
54. Compatibility of a homotopy structure h with a set W of “weak equivalences”. The homotopy structure h_W	161
55. Maps between homotopy structures	164
56. Another glimpse upon canonical modelizers. Provisional working plan – and recollection of some questions	165

57. Relation of homotopy structures to 0-connectedness and π_0 . The canonical homotopy structure h_M of a category M	168
58. Case of a totally 0-connected category M . The category $\overline{(\text{Cat})}$ of (small) categories and homotopy classes of functors.....	173
59. Case of the “next best” modelizer (Spaces) – and need of introducing the π_0 -functor as an extra structure on a would-be modelizer M	175
60. Case of a strictly totally aspheric topos. A timid start on axiomatizing the set \mathcal{W} of weak equivalences in (Cat) ...	177
61. Remembering about the promised “key result” at last!.....	180
62. An embarrassing case of hasty over-axiomatization. The unexpected richness	185
63. Review of terminology (provisional)	188
64. Review of properties of the “basic localizer” $W_{(\text{Cat})}$	192
65. Still another review of the test notions (relative to a given basic localizer).....	197
A) Total \mathcal{W} -asphericity	199
B) Weak \mathcal{W} -test categories	200
C) \mathcal{W} -test categories	201
D) Strict \mathcal{W} -test categories	203
E) Weak \mathcal{W} -test functors, and \mathcal{W} -test functors. The “key result” in the long last! (first version)	204
F) \mathcal{W} -test functors $A \rightarrow (\text{Cat})$ of strict \mathcal{W} -test categories	207
66. Revising (and fixing?) terminology again.....	208
IV. Asphericity structures.....	215
67. Back to the asphericity game: the categories (Hot_A)	215
68. Digression on a “new continent”	218
69. Digression on six weeks’ scratchwork: <i>derivators</i> , and integration of homotopy types	222
70. Digression on scratchwork (2): cohomological properties of maps in (Cat) and in \hat{A} . Does any topos admit a “dual” topos? Kan fibrations rehabilitated	228
71. Working program and rambling questions (group objects as models, Dold-Puppe theorem ...)	234
72. Back to asphericity: criteria for a map in (Cat)	240
73. Asphericity criteria (continued).....	247
74. Application to products of test categories	249
75. Asphericity structures: a bunch of useful tautologies	258
76. Examples. Totally aspheric asphericity structures	264
77. The canonical functor $\text{Hot}_M \rightarrow (\text{Hot})$	266
78. Test functors and modeling asphericity structures: the outcome (at last!) of an early “observation”	268
79. Asphericity structure generated by a contractibility structure: the final shape of the “awkward main result” on test functors	273
80. Reminders and questions around canonical modelizers.....	280

81. Contractibility as the common expression of homotopy, asphericity and 0-connectedness notions. (An overall review of the notions met with so far.)	283
82. Proof of injectivity of $\alpha : \text{Cont}(M) \hookrightarrow \mathcal{W}\text{-Asph}(M)$. Application to <u>Hom</u> objects and to products of aspheric functors $A \rightarrow M$	290
83. Tautologies on $\text{Im } \alpha$, and related questions	296
84. A silly (provisional) answer to the “silly question” (of section 46) and the new perplexity $f_!(M_{\text{as}}) \subset M'_{\text{as}}$?	297
85. Digression on left exactness properties of $f_!$ functors, application to the inclusion $i : \mathbf{\Delta} \hookrightarrow (\text{Cat})$	304
86. Bimorphisms of contractibility structures as the (final?) answer. Does the notion of a map of asphericity structures exist?	308
87. Comments on Thomason’s paper on closed model structure of (Cat)	313
88. Review of pending questions and topics (questions (1) to (5), including characterizing canonical modelizers)	315
89. Digression (continued) on left exactness properties of $f_!$ functors	322
90. Review of questions (continued): 6) Existence of test functors and related questions. Digression on strictly generating subcategories	324
91. Review of questions (continued): 7) Homotopy types of finite type, 8) test categories with boundary operations, 9) miscellaneous	334
95. Contractors	341
96. “Vertical” and “horizontal” topoi... (afterthoughts on terminology)	348
97. “Projective” topoi. Morphisms and bimorphisms of contractors	351
98. Sketch of proof of $\mathbf{\Delta}^f$ being a weak test category and perplexities about its being aspheric!	355
Définition des principales notations	359
Index des notations	365
Index des principaux thèmes	367
Index terminologique	369
Index des personnes citées par Grothendieck	381
Commentaires	383
1. La catégorie globulaire ou hémisphérique	383
2. La catégorie cubique standard et ses variantes	389
3. Les topologies test	394
4. Un ensemble ordonné qui est une catégorie test faible	399
5. Les notions purement homotopiques; un contre-exemple	401
6. L’adjoint à gauche du nerf ne respecte pas les objets asphériques	403
7. Un procédé de construction de foncteurs test	407

Glossaire des principaux termes	411
1. Les ∞ -groupoïdes faibles, alias ∞ -champs	411
2. Notions de saturation d'une classe de flèches	413
3. Segments	414
4. Les localisateurs de base	415
5. Les notions d'asphéricité dans (Cat) et les catégories de préfaisceaux.....	416
6. Les modélisateurs et les catégories test	418
7. Les foncteurs test à valeurs dans (Cat)	420
8. Les notions purement homotopiques	422
9. Précontracteurs et contracteurs	424
10. Structures d'asphéricité.....	424
