The asterisks in front of the chapter titles below represent the author’s rating system: the more asterisks, the more important the article.

Preface	xv
Interlude: 1725–1727	1
1 E-1: Constructio linearum isochronarum in medio quocunque resistente	3
Construction of isochronal curves in any kind of resistant	
1725; <i>Euler’s first paper</i>	
2 E-3: Methodus inveniendi trajectorias reciprocas algebraicas	6
Method of finding reciprocal algebraic trajectories	
1727; <i>A now forgotten problem</i>	
Interlude: 1728	13
3 E-5: Problematis trajectoriarum reciprocarum solutio	15
Solution to problems of reciprocal trajectories	
<i>More on the forgotten problem</i>	
*4 E-10: Nova methodus innumerabiles aequationes differentialis secundi gradus reducendi ad aequationes differentialis primi gradus	22
A new method of reducing innumerable differential equations of the second degree to equations of the first degree	
<i>Integrating factor</i>	
Interlude: 1729–1731	31
*5 E-19: De progressionibus transcendentibus seu quarum termini generales algebraice dari nequeunt	33
On transcendental progressions, or those for which the general term cannot be given algebraically	
1729; <i>Euler invents the Gamma function</i>	
**6 E-9: De linea brevissima in superficie quacunq̄ue duo quaelibet puncta iungente	44
On the shortest curve on a surface that joins any two given points	
1739; <i>Euler advances calculus of variations as a homework problem</i>	
7 E-20: De summatione innumerabilium progressionum	52
On the summation of innumerably many progressions	
1731; <i>Interpolating the partial sums of the harmonic series</i>	

Interlude: 1732	65
8 E-25: Methodus generalis summandi progressionibus	67
General methods for summing progressions	
<i>Beginnings of Euler-Maclaurin series</i>	
**9 E-26: Observationes de theoremate quodam Fermatiano aliisque ad numeros primos spectantibus	74
Observations on theorems that Fermat and others have looked at about prime numbers	
<i>The fifth Fermat number is not prime, and beginnings of the Euler-Fermat theorem</i>	
10 E-27: Problematis isoperimetrici in latissimo sensu accepti solutio generalis	79
An account of the solution of isoperimetric problems in the broadest sense	
<i>Beginnings of the Euler necessary condition in Calculus of Variations</i>	
Interlude: 1733	89
11 E-11: Constructio aequationum quarundam differentialium quae indeterminatarum separationem non admittunt	91
Construction of differential equations which do not admit separation of variables	
<i>A very short article about the Riccati equation</i>	
12 E-28: Specimen de constructione aequationum differentialium sine indeterminatarum separationem	94
Example of the solution of a differential equation without separation of variables	
<i>Riccati equation and arc length of an ellipse</i>	
13 E-29: De solutione problematum Diophanteorum per numeros integros	102
On the solution of problems of Diophantus about integer numbers	
<i>Pell equation and similar problems</i>	
14 E-30: De formis radicum aequationum cuiusque ordinis conjectatio	106
Inferences on the forms of roots of equations and of their orders	
<i>An obscure paper in the theory of equations</i>	
15 E-31: Constructio aequationis differentialis $ax^n dx = dy + y^2 dx$	114
Solution of the differential equation $ax^n dx = dy + y^2 dx$	
<i>Results on the Riccati equation</i>	
Interlude: 1734	123
16 E-42: De linea celerrimi descensus in medio quocunque resistente	125
On curves of fastest descent in a resistant medium	
<i>Brachystochrone problem with friction</i>	
17 E-43: De progressionibus harmonicis observationes	133
Observations on harmonic progressions	
<i>A sequel to E-20 and E-25</i>	

*18 E-44: De infinitis curvis eiusdem generis seu methodus inveniendi aequationes pro infinitis curvis eiusdem generis	142
On an infinity of curves of a given kind, or a method of finding equations for an infinity of curves of a given kind <i>Mixed partial derivatives are equal</i>	
*19 E-45: Additamentum ad dissertationem de infinitis curvis eiusdem generis	148
Additions to the dissertation on infinitely many curves of a given kind <i>Sequel to E-44—first use of $f(x)$ notation</i>	
20 E-48: Investigatio binarum curvarum, quarum arcus eidem abscissae respondents summam algebraicam constituent	150
Investigation of two curves, the abscissas of which are corresponding arcs and the sum of which is algebraic <i>A forgettable paper on rectifiable algebraic curves</i>	
Interlude: I 735	155
***21 E-41: De summis serierum reciprocarum	157
On sums of series of reciprocals <i>Euler solves the Basel problem</i>	
22 E-46: Methodus universalis serierum convergentium summas quam proxime inveniendi	166
A universal method for finding sums which approximate convergent series <i>Euler-Maclaurin series</i>	
23 E-47: Inventio summae cuiusque seriei ex dato termino generali	170
Finding the sum of a series from a given general term <i>Continuing work from E45 and E46</i>	
24 E-51: De constructione aequationum ope motus tractorii aliisque ad methodum tangentium inversam pertinentibus	176
On the solution of equations from the motion of pulling and other equations pertaining to the method of inverse tangents <i>On the tractrix, and other related mechanically constructed curves</i>	
25 E-52: Solutio problematum rectificationem ellipsis requirentium	188
Solution of a problem requiring the rectification of an ellipse <i>Arc length integrals for an ellipse</i>	
***26 E-53: Solutio problematis ad geometriam situs pertinentis	195
Solution of a problem relating to the geometry of position <i>Königsberg Bridge problem</i>	
Interlude: I 736	201
**27 E-54: Theorematum quorundam ad numeros primos spectantium demonstratio	203
Proof of some theorems about looking at prime numbers <i>Euler's first proof of Fermat's Little Theorem</i>	

28 E-55: Methodus universalis series summandi ulterius promota 207
 Further universal methods for summing series
Sequel to E46 and E47

**29 E-56: Curvarum maximi minimive proprietate gaudentium inventio
 nova et facilis 212**
 A new and easy way of finding curves enjoying properties of maximum or minimum
More on the Euler necessary condition in calculus of variations

Interlude: 1737 227

30 E-70: De constructione aequationum 229
 On the solution of equations
Euler uses the Laplace transform in an otherwise unremarkable paper

*****31 E-71: De fractionibus continuis dissertatio 234**
 An Essay on Continued Fractions
Most of what we know about continued fractions is here

*****32 E-72: Varias observationes circa series infinitas 249**
 Various observations about infinite series
Product-sum formula for the Zeta function, and other neat results

33 E-73: Solutio problematis geometrici circa lunulas a circulis formatas . . . 261
 Solution to a geometric problem about lunes formed by circles
Euler's thoughts on an ancient problem of Hippocrates

Interlude: 1738 269

**34 E-23: De curvis rectificabilibus algebraicis atque trajectoriis
 reciprocis algebraicis 271**
 On rectifiable algebraic curves and algebraic reciprocal trajectories
Curves with arc length integrals we can actually evaluate

**35 E-74: De variis modis circuli quadraturam numeris
 proxime exprimendi 274**
 On various ways of closely approximating numbers for the
 quadrature of the circle
Ways to approximate pi

**36 E-95: De aequationibus differentialibus, quae certis tantum casibus
 integrationem admittunt 279**
 On differential equations which sometimes can be integrated
Some efforts with undetermined coefficients

***37 E-98: Theorematum quorundam arithmetorum demonstrationes 284**
 Proofs of some theorems of arithmetic
Fermat's Last Theorem for $n = 4$

**38 E-99: Solutio problematis cuiusdam a celeberrimo
 Daniele Bernoullio propositi 293**
 Solution of some problems that were posed by the celebrated
 Daniel Bernoulli
An interesting calculus of variations problem involving curvature

Interlude: I 739	299
39 E-122: De productis ex infinitis factoribus ortis	301
On products arising from infinitely many factors	
<i>A few further results related to the Gamma function</i>	
40 E-123 : De fractionibus continuis observationes	306
Observations on continued fractions	
<i>A sequel to E71, with more emphasis on applications to integration</i>	
41 E-125: Consideratio progressionis cuiusdam ad circuli quadraturam inveniendam idoneae	317
Consideration of some progressions appropriate for finding the quadrature of the circle	
<i>Bernoulli numbers, divergent series and how to approximate pi</i>	
42 E-128: Methodus facilis computandi angulorum sinus ac tangentes tam naturales quam artificiales	323
An easy method for computing sines and tangents of angles both natural and artificial	
<i>To 20 decimal places!</i>	
43 E-129: Investigatio curvarum quae evolutae sui similes producant	328
Investigation of curves which produce evolutes that are similar to themselves	
<i>Huygens solved the simplest case of the problem. Euler takes it much farther.</i>	
44 E-130: De seriebus quibusdam considerationes	342
Considerations about certain series	
<i>More work on the methods he used</i>	
Interlude: I 740	349
45 E-36: Solutio problematis arithmetici de inveniendo numero, qui per datos numeros divisus, relinquat data residua	351
Solution of problems in arithmetic of finding a number, which, when divided by given numbers leaves given remainders	
<i>Chinese remainder theorem</i>	
46 E-157: De extractione radicum ex quantitibus irrationalibus	357
On the extraction of roots of irrational quantities	
<i>Gymnastics with radical signs</i>	
Interlude: I 741	365
*47 E-63: Démonstration de la somme de cette suite	367
$1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} + \frac{1}{25} + \frac{1}{36} + \text{etc.}$	
Proof of the sum of this series $1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} + \frac{1}{25} + \frac{1}{36} + \text{etc.}$	
<i>A correct, but rather boring, solution to the problem</i>	
**48 E-158: Observationes analyticae variae de combinationibus	371
Several analytic observations on combinations	
<i>Euler invents generating functions and solves partition problems</i>	
49 E-790: Commentatio de matheseos sublimioris utilitate	381
On the utility of higher mathematics
