Preface	xiii
Chapter 1. The Number Systems	1
§1.1. The natural numbers	1
§1.2. An automatic approach to finite sums	3
§1.3. Elementary counting	8
§1.4. The integers and divisibility	11
§1.5. The Euclidean algorithm	12
§1.6. Modular arithmetic	19
§1.7. Prime numbers	20
§1.8. The rational numbers	29
§1.9. The set of real numbers	40
§1.10. Fundamental sequences and completions	52
§1.11. Complex numbers	54
Chapter 2. Factorials and Binomial Coefficients	57
§2.1. The definitions	57
§2.2. A counting argument	60
§2.3. The generating function of binomial coefficients	61
§2.4. An extension of the binomial theorem to noninteger exponents	63

§2.5.	Congruences for factorials and binomial coefficients	66
§2.6.	The prime factorization of $n!$	76
§2.7.	The central binomial coefficients	82
§2.8.	Bertrand's postulate	88
§2.9.	Some generating functions involving valuations	91
§2.10.	The asymptotics of factorials: Stirling's formula	94
§2.11.	The trinomial coefficients	96
Chapter 3.	The Fibonacci Numbers	105
§3.1.	Introduction	105
§3.2.	What do they count?	106
§3.3.	The generating function	108
§3.4.	A family of related numbers	110
§3.5.	Some arithmetical properties	112
§3.6.	Modular properties of Fibonacci numbers	120
§3.7.	Continued fractions of powers of Fibonacci quotients	123
§3.8.	Fibonacci polynomials	124
§3.9.	Series involving Fibonacci numbers	129
Chapter 4.	Polynomials	133
§4.1.	Introduction	133
§4.2.	Examples of polynomials	134
§4.3.	The division algorithm	139
§4.4.	Roots of polynomials	141
§4.5.	The fundamental theorem of algebra	144
§4.6.	The solution of polynomial equations	146
§4.7.	Cubic polynomials	151
§4.8.	Quartic polynomials	155
Chapter 5.	Binomial Sums	159
§5.1.	Introduction	159
§5.2.	Power sums	160
§5.3.	Moment sums	167

Contents	ix
§5.4. Recurrences for powers of binomials	171
§5.5. Calkin's identity	173
Chapter 6. Catalan Numbers	179
§6.1. The placing of parentheses	179
§6.2. A recurrence	179
§6.3. The generating function	180
§6.4. Arithmetical properties	186
§6.5. An integral expression	190
Chapter 7. The Stirling Numbers of the Second Kind	191
§7.1. Introduction	191
§7.2. A recurrence	192
§7.3. An explicit formula	194
§7.4. The valuations of Stirling numbers	197
Chapter 8. Rational Functions	211
§8.1. Introduction	211
§8.2. The method of partial fractions	213
§8.3. Rational generating functions	217
§8.4. The operator point of view	219
§8.5. A dynamical system	221
§8.6. Sums of four squares	225
§8.7. The integration of rational functions	229
§8.8. Symbolic integration. The methods of Hermite and Rothstein-Trager	237
Chapter 9. Wallis' Formula	245
§9.1. An experimental approach	245
§9.2. A proof based on recurrences	247
§9.3. A proof based on generating functions	248
§9.4. A trigonometric version	249
§9.5. An automatic proof	252

Chapter 10. Farey Fractions	255
§10.1. Introduction	255
§10.2. Farey fractions and the Stern-Brocot tree	255
§10.3. The distribution of denominators	262
Chapter 11. The Exponential Function	269
§11.1. Introduction	269
§11.2. Elementary properties of the exponential function	272
§11.3. The constant e	274
§11.4. The series representation of e	275
§11.5. Arithmetical properties of e	278
§11.6. Continued fractions connected to e	284
§11.7. Derangements: The presence of e in combinatorics	288
§11.8. The natural logarithm	293
§11.9. The binary expansion of $\ln 2$	294
§11.10. The irrationality of $\ln 2$	295
§11.11. Harmonic numbers	302
Chapter 12. Trigonometric Functions	309
§12.1. Introduction	309
§12.2. The notion of angle	309
§12.3. Sine and cosine	311
§12.4. The additional trigonometric functions	314
§12.5. The addition theorem	320
§12.6. Stirling's formula and π	323
§12.7. The continued fraction of π	325
§12.8. The digits of π in base 16	330
§12.9. Special values of trigonometric functions	331
§12.10. The roots of a cubic polynomial	335
§12.11. A special trigonometric integral	339
§12.12. The infinite product for $\sin x$	343

Contents	xi
§12.13. The irrationality of π	346
§12.14. Arctangent sums and a dynamical system	349
Chapter 13. Bernoulli Polynomials	355
§13.1. Introduction	355
§13.2. The exponential generating function	356
§13.3. Elementary properties of Bernoulli numbers	357
§13.4. Integrals involving Bernoulli polynomials	366
§13.5. A relation to Stirling numbers	369
§13.6. Arithmetic properties of Bernoulli numbers	371
§13.7. The Euler-MacLaurin summation formula	376
§13.8. Bernoulli numbers and solitons	383
§13.9. The Giuga-Agoh conjectured criterion for primality	384
Chapter 14. A Sample of Classical Polynomials: Legendre, Chebyshev, and Hermite	387
§14.1. Introduction	387
§14.2. Legendre polynomials	387
§14.3. Chebyshev polynomials	400
§14.4. Hermite polynomials	403
Chapter 15. Landen Transformations	411
§15.1. Introduction	411
§15.2. An elementary example	413
§15.3. The case of rational integrands	415
§15.4. The evaluation of a quartic integral	417
§15.5. An integrand of degree six	435
§15.6. The original elliptic case	438
Chapter 16. Three Special Functions: Γ , ψ , and ζ	445
§16.1. Introduction	445
§16.2. The gamma function	446

§16.3. Elementary properties of the gamma function	447
§16.4. Special values of the gamma function	449
§16.5. The infinite product for the gamma function	450
§16.6. The beta function	455
§16.7. The digamma function	458
§16.8. The Riemann zeta function	460
§16.9. The values of $\zeta(2n)$	461
§16.10. Apéry's constant $\zeta(3)$	463
Bibliography	473
Index	493
