Preface	ix
What Part III is about	ix
Acknowledgments	x
Contents of Part III of Volume Two	xiii
Notation and Symbols	xvii
Chapter 17. Entropy, μ -invariant, and Finite Time Singularities	1
1. Compact finite time singularity models are shrinkers	1
2. Behavior of $\mu(g, \tau)$ for τ small	15
3. Existence of a minimizer for the entropy	23
4. 1- and 2-loop variation formulas related to RG flow	31
5. Notes and commentary	36
Chapter 18. Geometric Tools and Point Picking Methods	39
1. Estimates for changing distances	40
2. Spatial point picking methods	49
3. Space-time point picking with restrictions	57
4. Necks in manifolds with positive sectional curvature	62
5. Localized no local collapsing theorem	68
6. Notes and commentary	76
Chapter 19. Geometric Properties of κ -Solutions	79
1. Singularity models and κ -solutions	80
2. The κ -noncollapsed condition	85
3. Perelman's κ -solution on the n -sphere	93
4. Equivalence of 2- and 3-dimensional κ -solutions with and without Harnack	104
5. Existence of an asymptotic shrinker	106
6. The κ -gap theorem for 3-dimensional κ -solutions	116
7. Notes and commentary	120
Chapter 20. Compactness of the Space of κ -Solutions	123
1. ASCR and AVR of κ -solutions	124
2. Almost κ -solutions	129
3. The compactness of κ -solutions	136
4. Derivative estimates and some conjectures	149

5. Notes and commentary	154
Chapter 21. Perelman's Pseudolocality Theorem	157
1. Statement and interpretation of pseudolocality	158
2. Setting up the proof by contradiction and point picking	166
3. Local entropies are nontrivial near bad points	171
4. Contradicting the almost Euclidean logarithmic Sobolev inequality	178
5. Notes and commentary	179
Chapter 22. Tools Used in Proof of Pseudolocality	183
1. A point picking method	183
2. Heat kernels under Cheeger–Gromov limits	191
3. Upper bound for the local entropy $\int_B v d\mu$	197
4. Logarithmic Sobolev inequality via the isoperimetric inequality	206
5. Notes and commentary	211
Chapter 23. Heat Kernel for Static Metrics	215
1. Construction of the parametrix for the heat kernel on a Riemannian manifold	216
2. Existence of the heat kernel on a closed Riemannian manifold via parametrix	228
3. Differentiating a convolution with the parametrix	238
4. Asymptotics of the heat kernel for a static metric	251
5. Supplementary material: Elementary tools	259
6. Notes and commentary	263
Chapter 24. Heat Kernel for Evolving Metrics	265
1. Heat kernel for a time-dependent metric	266
2. Existence of the heat kernel for a time-dependent metric	271
3. Aspects of the asymptotics of the heat kernel for a time-dependent metric	278
4. Characterizing Ricci flow by the asymptotics of the heat kernel	285
5. Heat kernel on noncompact manifolds	290
6. Notes and commentary	303
Chapter 25. Estimates of the Heat Equation for Evolving Metrics	305
1. Mean value inequality for solutions of heat-type equations with respect to evolving metrics	305
2. Li–Yau differential Harnack estimate for positive solutions of heat-type equations with respect to evolving metrics	317
3. Notes and commentary	331
Chapter 26. Bounds for the Heat Kernel for Evolving Metrics	333
1. Heat kernel for an evolving metric	333
2. Upper and lower bounds of the heat kernel for an evolving metric	345

3. Heat balls and the space-time mean value property	363
4. Distance-like functions on complete noncompact manifolds	377
5. Notes and commentary	386
Appendix G. Elementary Aspects of Metric Geometry	387
1. Metric spaces and length spaces	388
2. Aleksandrov spaces with curvature bounded from below	401
3. Notes and commentary	412
Appendix H. Convex Functions on Riemannian Manifolds	413
1. Elementary aspects of convex analysis on Euclidean space	413
2. Connected locally convex subsets in Riemannian manifolds	417
3. Generalized gradients of convex functions on Riemannian manifolds	433
4. Integral curves to gradients of concave functions	442
5. Notes and commentary	456
Appendix I. Asymptotic Cones and Sharafutdinov Retraction	457
1. Sharafutdinov retraction theorem	457
2. The existence of asymptotic cones	465
3. A monotonicity property of nonnegatively curved manifolds within the injectivity radius	468
4. Critical point theory and properties of distance spheres	472
5. Approximate Busemann–Feller theorem	482
6. Equivalence classes of rays and points at infinity	487
7. Notes and commentary	495
Appendix J. Solutions to Selected Exercises	497
Bibliography	503
Index	513
