Introduction	vii
Chapter 1. Formulation of the Problem	1
1.1. Six-vertex Model	1
1.2. Using Tensor Notation	2
1.3. The Main Object of Our Study	6
1.4. Spectral Parameter and R-Matrix	7
1.5. Six-vertex Model on a Plane	9
1.6. XXZ Anti-ferromagnet at Finite Temperature	12
1.7. Density Matrix and Entanglement von Neumann Entropy	16
1.8. Our Strategy in Volume I	17
Chapter 2. Spectral Problem in Matsubara Direction and Quantum Groups	19
2.1. Algebraic Bethe Ansatz	19
2.2. Algebra $U_q(\widehat{\mathfrak{sl}}_2)$	22
2.3. Bazhanov-Lukyanov-Zamolodchikov Construction	27
2.4. Higher Spins in Matsubara Space	35
2.5. Q-Operators	41
2.6. Destri-deVega Equation	43
Chapter 3. Fermions	47
3.1. Intertwiner and Quasi-intertwiner for Fused Modules	48
3.2. Operators $\mathbf{k}(\zeta, \alpha)$ and $\phi(\mathbf{k})(\zeta, \alpha)$	50
3.3. Annihilation Operators	59
3.4. Creation Operators	61
3.5. Fermionic Creation Operators	65
3.6. Homogeneous Versus Inhomogeneous Cases: Russian Doll Construction	71
3.7. Commutation Relations Between Creation and Annihilation Operators	76
3.8. Summary	80
Chapter 4. Main Theorem	83
4.1. Fermionic Basis and Difference Equations	83
4.2. Deformed Abelian Differentials	85
4.3. Main Theorem	93
4.4. Completeness in Homogeneous Case	102
4.5. Summary	108
Chapter 5. Applications and Generalisations	111
5.1. Function $\omega(\zeta, \xi \alpha)$ via Integral Equation	111

5.2. Main Theorem and Inverse Problem	117
5.3. The Case $\alpha = 0$	126
5.4. XXX Case	149
5.5. Remarks on XYZ Case	154
Appendix A. Quasi-classical Limit and Algebraic Geometry	165
A.1. Algebraic Interpretation of Quantum Results	165
A.2. Canonical Differential in the Classical Case	167
A.3. Riemann Surfaces	171
A.4. Affine Jacobi Variety	174
A.5. Classical Interpretation of Fermionic Basis	178
Notation	181
Bibliography	187
Index	191
