Preface	ix
Introduction	1
Chapter 1. Properties of linear combinations of ridge functions	9
1.1. A brief excursion into the approximation theory of ridge functions	9
1.2. Representation of multivariate functions by linear combinations of ridge functions	18
1.3. Characterization of an extremal sum of ridge functions	27
1.4. Sums of continuous ridge functions	42
1.5. On the proximality of ridge functions	46
1.6. On the approximation by weighted ridge functions	52
Chapter 2. The smoothness problem in ridge function representation	59
2.1. A solution to the problem up to a multivariate polynomial	59
2.2. A solution to the smoothness problem under certain conditions	70
2.3. A constructive analysis of the smoothness problem	78
Chapter 3. Approximation of multivariate functions by sums of univariate functions	89
3.1. Characterization of some bivariate function classes by formulas for the error of approximation	89
3.2. Approximation by sums of univariate functions on certain domains	96
3.3. On the theorem of M. Golomb	103
Chapter 4. Generalized ridge functions and linear superpositions	111
4.1. Representation theorems	111
4.2. Uniqueness theorems	118
4.3. An approximation algorithm	126
Chapter 5. Applications to neural networks	139
5.1. Universal approximation property of neural networks	139
5.2. Single hidden layer neural networks with restricted weights	143
5.3. Two hidden layer neural networks	156
5.4. Construction of a universal sigmoidal function	164
Bibliography	175
Index	185
