Preface	ix
Chapter 1. Introduction	1
1.1. Self-similar sets	2
1.2. Self-affine sets	10
1.3. Iterated function systems and the symbolic space	12
1.4. Preliminaries on fractal geometry	17
1.5. Similarity dimension; the dimension of self-similar sets with well separated cylinders	26
1.6. Self-similar sets with overlaps	30
1.7. Self-similar graph directed IFS on the line*	33
1.8. Stationary measures for iterated function systems	36
1.9. Dimension of measures	42
1.10. Dimension of self-affine sets	49
1.11. Self-affine sets with aligned cylinders	53
1.12. Self-affine sets without alignment	56
Chapter 2. Elements of Geometric Measure Theory	59
2.1. Densities for Radon measures	59
2.2. Product theorems	62
2.3. Projection theorems	63
2.4. Slicing theorems	67
2.5. Besicovitch projection theorem and generalizations	68
2.6. L^q dimensions and entropy dimension	70
2.7. Generalized Hausdorff and packing measures	74
Chapter 3. General properties of self-similar sets and measures	75
3.1. Consequences of stationarity	75
3.2. On the dimension of self-similar measures.	80
3.3. Equality of box and Hausdorff dimension	84
3.4. Hausdorff measure of self-similar sets	86
3.5. Lower semicontinuity of the Hausdorff dimension of self-similar sets.	88
3.6. Existence of L^q dimensions	89
3.7. Existence of entropy dimension and lower semicontinuity of the entropy and Hausdorff dimensions of self-similar measures	92
Chapter 4. Separation properties for self-similar IFS	97
4.1. Conditions that are equivalent to the OSC	97
4.2. Weak Separation Property	102

4.3. Example: The $\{0, 1, 3\}$ -IFS with contraction ratio $\lambda = 1/3$	116
4.4. Finite type condition	122
4.5. Special family of finite type*	130
Chapter 5. Multifractal Analysis for self-similar measures	139
5.1. Multifractal spectrum and multifractal formalism	139
5.2. Multifractal analysis for IFS satisfying the weak separation or finite type condition	149
5.3. Divergence points of self-similar measures	150
Chapter 6. Transversality techniques for self-similar IFS	155
6.1. Self-similar sets on the line with overlaps (linear dependence)	156
6.2. Self-similar measures on the line with overlaps (linear dependence)	158
6.3. Self-similar sets and measures on the line (nonlinear dependence)	162
6.4. How to check transversality?	168
6.5. First applications	170
6.6. Generalized projection scheme	172
6.7. Applications of the Generalized Projection Scheme	178
6.8. A survey of more recent results	184
Chapter 7. Further properties of self-similar IFS with overlaps	193
7.1. Hausdorff and packing measure for self-similar IFS: Introduction	193
7.2. Positive packing measure and intersection numbers	195
7.3. Zero Hausdorff measure and dimension drop	202
7.4. Singularity of self-similar measures without exact overlaps	209
7.5. Planar self-similar sets of positive Lebesgue measure and empty interior	212
7.6. Positive Hausdorff measure and the weak separation property	215
7.7. Examples	221
Chapter 8. Fourier-analytic and number-theoretic methods	227
8.1. Pisot–Vijayaraghavan and Garsia numbers	228
8.2. Fourier dimension and its variant	231
8.3. Fourier decay	234
8.4. Applications of Fourier decay	240
8.5. Growth rate of β -expansions and local dimensions of Bernoulli convolutions	242
8.6. Garsia entropy and dimension of Bernoulli convolutions for algebraic parameters	248
Chapter 9. Elements of Ergodic Theory	255
9.1. Ergodic theorems	255
9.2. Multiplicative Ergodic Theorem (Oseledeč Theorem)	257
9.3. Conditional expectation and martingales	260
9.4. Measurable partitions, Lebesgue spaces, Rokhlin’s theorem	261
9.5. Entropy	269
Chapter 10. Self-affine sets and measures	273
10.1. Introduction	273
10.2. Singular value function	276
10.3. Self-affine Generalized Projection Scheme	280

10.4.	Self-affine transversality and the proof of Theorem 10.1.2	287
10.5.	Thermodynamic formalism	290
10.6.	Dominated matrices	296
10.7.	A survey of some related results	299
Chapter 11.	Diagonally self-affine IFS	303
11.1.	The Feng–Hu Theorem in full generality	304
11.2.	Feng–Hu Theorem in \mathbb{R}^2 assuming separation	308
11.3.	Dimension of homogeneous self-similar measures	313
11.4.	Box dimension of self-affine sets with aligned cylinders	323
11.5.	Applications: Self-affine carpets	328
Chapter 12.	Exact dimensionality and dimension conservation	345
12.1.	Random walk on the projective line and the Furstenberg measure	345
12.2.	Slices and dimension conservation	354
12.3.	The Ledrappier–Young formula	357
12.4.	Dimension conservation for the natural measure	369
Chapter 13.	Local entropy averages and projections of self-affine sets and measures	375
13.1.	Local entropy averages: Symbolic setting	375
13.2.	Local entropy averages: Concrete realization	380
13.3.	Orthogonal projections of self-affine measures	386
Chapter 14.	Nonlinear conformal iterated functions systems	393
14.1.	Existence and uniqueness of invariant measure in a general case	393
14.2.	Hyperbolic IFS on the line	395
14.3.	Equivalent conditions for OSC and WSP for nonlinear Iterated Function Systems	402
14.4.	Families of nonlinear overlapping IFS's	404
14.5.	Translation families and topologically generic IFS with overlaps	409
Appendix A.	Some elements of Linear algebra	413
A.1.	Singular values and SVD	413
A.2.	The k -fold exterior product of \mathbb{R}^d .	414
Appendix B.	Some elements of measure theory	415
B.1.	Measure spaces	415
B.2.	Measures on metric spaces	416
B.3.	Covering Theorems	418
B.4.	Density theorems	419
B.5.	Integral in terms of the distribution function	420
Appendix C.	Some elements of Harmonic Analysis	421
Appendix D.	Some facts about algebraic numbers	425
	Bibliography	429
	Index	447
	Basic notation	449
