Preface	ix
Acknowledgments	ix
1 Introduction to Differential Equations	1
1.1 Basic Terminology	2
1.1.1 Ordinary vs. Partial Differential Equations	2
1.1.2 Independent Variables, Dependent Variables, and Parameters	3
1.1.3 Order of a Differential Equation	3
1.1.4 What is a Solution?	3
1.1.5 Systems of Differential Equations	5
1.2 Families of Solutions, Initial-Value Problems	6
1.3 Modeling with Differential Equations	11
2 First-order Differential Equations	19
2.1 Separable First-order Equations	20
2.1.1 Application 1: Population Growth	23
2.1.2 Application 2: Newton’s Law of Cooling	25
2.2 Graphical Methods, the Slope Field	28
2.2.1 Using Graphical Methods to Visualize Solutions	32
2.3 Linear First-order Differential Equations	36
2.3.1 Application: Single-compartment Mixing Problem	41
2.4 Existence and Uniqueness of Solutions	44
2.5 More Analytic Methods for Nonlinear First-order Equations	51
2.5.1 Exact Differential Equations	51
2.5.2 Bernoulli Equations	56
2.5.3 Using Symmetries of the Slope Field	58
2.6 Numerical Methods	59
2.6.1 Euler’s Method	60
2.6.2 Improved Euler Method	64
2.6.3 Fourth-order Runge-Kutta Method	66
2.7 Autonomous Equations, the Phase Line	71
2.7.1 Stability—Sinks, Sources, and Nodes	73
Bifurcation in Equations with Parameters	74
3 Second-order Differential Equations	81
3.1 General Theory of Homogeneous Linear Equations	82
3.2 Homogeneous Linear Equations with Constant Coefficients	88
3.2.1 Second-order Equation with Constant Coefficients	88

3.2.2	Equations of Order Greater Than Two	93
3.3	The Spring-mass Equation	95
3.3.1	Derivation of the Spring-mass Equation	95
3.3.2	The Unforced Spring-mass System	96
3.4	Nonhomogeneous Linear Equations	102
3.4.1	Method of Undetermined Coefficients	102
3.4.2	Variation of Parameters	109
3.5	The Forced Spring-mass System	114
Beats and Resonance		117
3.6	Linear Second-order Equations with Nonconstant Coefficients	125
3.6.1	The Cauchy-Euler Equation	125
3.6.2	Series Solutions	127
3.7	Autonomous Second-order Differential Equations	135
3.7.1	Numerical Methods	136
3.7.2	Autonomous Equations and the Phase Plane	137
4	Linear Systems of First-order Differential Equations	145
4.1	Introduction to Systems	146
4.1.1	Writing Differential Equations as a First-order System	146
4.1.2	Linear Systems	147
4.2	Matrix Algebra	150
4.3	Eigenvalues and Eigenvectors	158
4.4	Analytic Solutions of the Linear System $\vec{x}' = \mathbf{A}\vec{x}$	165
4.4.1	Application 1: Mixing Problem with Two Compartments	169
4.4.2	Application 2: Double Spring-mass System	171
4.5	Large Linear Systems; the Matrix Exponential	176
4.5.1	Definition and Properties of the Matrix Exponential	176
4.5.2	Using the Matrix Exponential to Solve a Nonhomogeneous System	178
4.5.3	Application: Mixing Problem with Three Compartments	180
5	Geometry of Autonomous Systems	183
5.1	The Phase Plane for Autonomous Systems	184
5.2	Geometric Behavior of Linear Autonomous Systems	187
5.2.1	Linear Systems with Real (Distinct, Nonzero) Eigenvalues	188
5.2.2	Linear Systems with Complex Eigenvalues	190
5.2.3	The Trace-determinant Plane	191
5.2.4	The Special Cases	193
5.3	Geometric Behavior of Nonlinear Autonomous Systems	198
5.3.1	Finding the Equilibrium Points	199
5.3.2	Determining the Type of an Equilibrium	200
5.3.3	A Limit Cycle—the Van der Pol Equation	204
5.4	Bifurcations for Systems	207
5.4.1	Bifurcation in a Spring-mass Model	208
5.4.2	Bifurcation of a Predator-prey Model	208
5.4.3	Bifurcation Analysis Applied to a Competing Species Model	211
5.5	Student Projects	214
5.5.1	The Wilson-Cowan Equations	214
5.5.2	A New Predator-prey Equation—Putting It All Together	218

6 Laplace Transforms	221
6.1 Definition and Some Simple Laplace Transforms	221
6.1.1 Four Simple Laplace Transforms	223
6.1.2 Linearity of the Laplace Transform	224
6.1.3 Transforming the Derivative of $f(t)$	225
6.2 Solving Equations, the Inverse Laplace Transform	227
6.2.1 Partial Fraction Expansions	228
6.3 Extending the Table	232
6.3.1 Inverting a Term with an Irreducible Quadratic Denominator	233
6.3.2 Solving Linear Systems with Laplace Transforms	236
6.4 The Unit Step Function	239
6.5 Convolution and the Impulse Function	251
6.5.1 The Convolution Integral	251
6.5.2 The Impulse Function	253
6.5.3 Impulse Response of a Linear, Time-invariant System	256
7 Introduction to Partial Differential Equations	261
7.1 Solving Partial Differential Equations	261
7.1.1 An Overview of the Method of Separation of Variables	263
7.2 Orthogonal Functions and Trigonometric Fourier Series	266
7.2.1 Orthogonal Families of Functions	266
7.2.2 Properties of Fourier Series, Cosine and Sine Series	269
7.3 Boundary-Value Problems: Sturm-Liouville Equations	274
8 Solving Second-order Partial Differential Equations	285
8.1 Classification of Linear Second-order Partial Differential Equations	285
8.2 The 1-dimensional Heat Equation	289
8.2.1 Solution of the Heat Equation by Separation of Variables	291
8.2.2 Other Boundary Conditions for the Heat Equation	294
8.3 The 1-dimensional Wave Equation	299
8.3.1 Solution of the Wave Equation by Separation of Variables	300
8.3.2 D'Alembert's Solution of the Wave Equation on an Infinite Interval	305
8.4 Numerical Solution of Parabolic and Hyperbolic Equations	309
8.5 Laplace's Equation	318
8.6 Student Project: Harvested Diffusive Logistic Equation	324
Appendix	329
A Answers to Odd-numbered Exercises	331
B Derivative and Integral Formulas	385
C Cofactor Method for Determinants	387
D Cramer's Rule for Solving Systems of Linear Equations	389
E The Wronskian	391
F Table of Laplace Transforms	393
G Review of Partial Derivatives	395
Index	397
