The Computation of a Certain Metric Invariant of an Algebraic Number Field

By Horst Brunotte

Abstract. Let $F$ be an algebraic number field and denote by $N(a)$ the absolute norm and by $\overline{a}$ the maximum of the absolute values of the conjugates of the element $a$ of $F$. Define $c_F$ to be the best possible constant with the property: For every $a \in F$ there exists a unit $u$ of $F$ such that $\overline{u a} \leq c_F N(a)^{1/d(F,Q)}$. An algorithm for the computation of $c_F$ is described and some examples are given.

1. Introduction. Let $F$ be an algebraic number field of degree $d$ over the field of rational numbers $\mathbb{Q}$, $U$ the group of units of $F$, and $\sigma_1, \ldots, \sigma_r$ a full set of representatives of nonconjugate embeddings of $F$ into the field of complex numbers $\mathbb{C}$. We denote by $c_F$ the best possible constant with the property: For every $a \in F$ there exists a unit $u \in U$ such that

$$\max\{|\sigma_1(ua)|, \ldots, |\sigma_r(ua)|\} \leq c_F N(a)^{1/d} ;$$

here $N(b)$ is the absolute value of the usual norm of the element $b$ of $F$.

The existence of and upper bounds for $c_F$ are well known (e.g., [6, p. 526]; [7, p. 351]; [9, p. 22]; [10, p. 271]; [13, p. 260]), and it was shown in [3] that the constant $c_F$ can be computed effectively. Further some properties and an application of $c_F$ were investigated, and the value of $c_F$ was given for the case $r \leq 2$.

In the present note an algorithm for the computation of $c_F$ for the case $r > 2$ is described. However, this algorithm works well only if the degree and the absolute value of the discriminant $D$ of $F$ are small; this is mainly due to the fact (see the first step of the algorithm in Section 3) that the computation of a full system of nonequivalent integers of $F$ of absolute norm $\leq (2/\pi)^{t/2} \sqrt{|D|}$ ($t =$ number of complex primes of $F$) may require much computation time. Therefore the algorithm is used here to find the constant $c_F$ for some cyclotomic fields of small degree (see Table 2).

As a by-product of these computations, it is shown that the algorithm proposed by W. E. H. Berwick [1] for the computation of fundamental units of $F$ for the case $r = 3$ cannot be generalized for $r > 3$ (see Section 5 for details).

It should be noted that one can define a similar constant $c_F(U_0)$ for any subgroup $U_0$ of finite index in $U$. It can be derived easily from [3] that the analogue of Algorithm C below will also give the constant $c_F(U_0)$.

2. Auxiliary Results and an Upper Bound for $c_F$. Let $e_i = 1$ if $\sigma_i$ is real, $e_i = 2$ if $\sigma_i$ is complex, $\theta^{(i)} = \sigma_i(a)$ ($i = 1, \ldots, r$) and $\overline{a} = \max\{|\theta^{(i)}|, \ldots, |\theta^{(r)}|\}$ ($a \in F$). For $(b_1, \ldots, b_r) \in \mathbb{R}^r$ we denote by $U(b_1, \ldots, b_r)$ the set of units $u$ of $F$ such that $|u^{(i)}| \leq b_i$ ($i = 1, \ldots, r$). We shall assume throughout that $u_1, \ldots, u_{r-1}$ is a fundamental system of units of $F$, and for $u \in U$ we denote by $v_1(u), \ldots, v_{r-1}(u) \in \mathbb{Z}$ the exponents in the representation $u = wu_1^{v_1(u)} \cdots u_{r-1}^{v_{r-1}(u)}$ with $w$ a root of unity in $F$.

The results of the following lemmas are used for the computation of $c_F$; their proofs are left to the reader.

**Lemma 1.** Let $b_1, \ldots, b_r \in \mathbb{R}^+$, $u \in U(b_1, \ldots, b_r)$, and let $(a_{\rho i})_{\rho, i = 1, \ldots, r-1}$, be the inverse of the (regular) $(r-1) \times (r-1)$-matrix

\[
\begin{pmatrix}
  e_1 \log|u_1^{(i)}| & \cdots & e_1 \log|u_{r-1}^{(i)}| \\
  \vdots & \ddots & \vdots \\
  e_{r-1} \log|u_1^{(r-1)}| & \cdots & e_{r-1} \log|u_{r-1}^{(r-1)}|
\end{pmatrix}
\]

Then the following inequalities hold:

\[
|v_\rho(u)| \leq \sum_{i=1}^{r-1} |a_{\rho i}| \max\left\{e_i \log b_i, \sum_{j=1}^r e_j \log b_j\right\} \quad (\rho = 1, \ldots, r-1),
\]

\[
\sum_{\rho=1}^{r-1} v_\rho(u) \log|u_\rho^{(r)}| \leq \log b_r.
\]

**Corollary.** Let $F/\mathbb{Q}$ be Galois, $u \in U$, and assume that for every $\rho, \tau \in \{1, \ldots, r-1\}$ there exists an automorphism $\sigma$ of $F$ such that $|v_\rho(\sigma u)| = |v_\rho(u)|$. Then for $\rho = 1, \ldots, r-1$,

\[
|v_\rho(u)| \leq e_1(r-1)(\log \overline{a})\min\left\{\sum_{i=1}^{r-1} |a_{k i}| \quad k = 1, \ldots, r-1\right\},
\]

where $(a_{k i})_{k, i = 1, \ldots, r-1}$ is the matrix defined in Lemma 1.

**Remark.** In special cases the bounds for the $v_\rho$'s may be sharpened as the following example shows. Let $\mathbb{Q}^{(n)}$ be the $n$th cyclotomic field, $U_n$ the units and $W_n$ the roots of unity of $\mathbb{Q}^{(n)}$, $m = \varphi(n)/2$ (Euler's $\varphi$-function) and $b \in \mathbb{R}$, $b > 1$. For $n = 7, 11, 13$ using the fundamental system of units of $\mathbb{Q}^{(n)}$ as described in Table 2 (see Section 4) and the Galois module structure of $U_n$, one can find a full system of representatives of nonconjugate $u \in U_n$ modulo $W_n$ with $1 < \overline{u} \leq b$ by checking all integral $v_1, \ldots, v_{m-1}$ which satisfy conditions (i), (ii), (iii):

1. $|v_\rho| \leq 2(m-1)(\log b)\min\left\{|a_{k i}| \quad k = 1, \ldots, m-1\right\}$ ($\rho = 1, \ldots, m-1$),
2. $\sum_{\rho=1}^{m-1} v_\rho \log |u_\rho^{(m)}| \leq \log b$,
3. $v_1 \geq 1$.

For let $n = 7$ (the other cases are dealt with similarly) and let $u \in U_7$ such that $1 < \overline{u} \leq b$. Using the fundamental system of units of $\mathbb{Q}^{(7)}$, as given in Table 2, the conjugates of $u = u_1^{v_1}u_2^{v_2}$ are $u' = u_1^{v_1}u_2^{v_2+1}$ and $u'' = u_1^{v_1+1}u_2^{v_2}$. It suffices to show that one of the pairs $(v_1(u), v_2(u))$, $(v_1(u'), v_2(u'))$, $(v_1(u''), v_2(u''))$ satisfies condition (iii) above, because by Lemma 1 and its corollary each of these three pairs
satisfies (i) and (ii). If \( v_1 > 1 \), the first pair will do. If \( v_1 = 0 \), choose either the second or the third pair according as \( v_2 > 0 \) or \( v_2 < 0 \). In case \( v_1 < 0 \), take the second pair if \( v_2 > 0 \) and the third pair otherwise.

**Lemma 2.** Let \( u \in U, \rho \in \{ 1, \ldots, r - 1 \}, v_k = u_\rho^k u \) for \( k \in \mathbb{Z} \), and suppose \( v_1 \geq v_0 \). Then \( v_k \geq v_0 \) for all \( k \in \mathbb{N} \).

**Lemma 3** (B. L. van der Waerden [13]). Let \( D \) be the discriminant of \( F \), \( t \) the number of complex primes of \( F \), \( g_F = (2/\pi)^{t/4} |D| \), \( R \) the ring of integers of \( F \), and \( a_1, \ldots, a_s \in R \) a full set of representatives of nonassociate \( a \in R \setminus \{0\} \) such that \( N(a) \leq g_F \). For each \( j \in \{ 1, \ldots, r \} \) there exists a unit \( u \in U \) such that \( |u(i)| < 1 \) for \( i \neq j \) and

\[
|u(i)| \leq \left( g_F \max \left\{ |a_j^{(k)}|^{-d} |l = 1, \ldots, s; k = 1, \ldots, r \} \right\}^{1/e_j}.
\]

The proof of the following proposition, which gives an upper bound for \( c_F \), is analogous to that of the first part of [10, Satz 8] and will be omitted.

**Proposition 1.**

\[
c_F \leq \max_{i=1, \ldots, r} \left\{ \prod_{j=1}^{r-1} \max_{\rho=1} \left\{ 1, |u_\rho^{(i)}| \right\} \right\}.
\]

**Examples.** Using the units (or their inverses) of \( \mathbb{Q}^\rho \), as given in Table 2 below, the following upper bounds for \( c_{\mathbb{Q}^p} \), for primes \( p \) with \( 7 \leq p \leq 19 \) can be obtained (see Table 1).

3. **Outline of the Algorithm.** The algorithm for the computation of \( c_F \) will be given in the style of Knuth [8]. It was shown in [3] that this algorithm does in fact yield the constant \( c_F \).

**Algorithm C** (Computation of \( c_F \)).

\begin{itemize}
  \item C 1. (Computation of units \( v_1, \ldots, v_r \in U \) with the property \( |v_\rho^{(j)}| < 1 \) for \( \rho, j = 1, \ldots, r; \rho \neq j \). Compute a full system of representatives \( a_1, \ldots, a_s \in R \) of the nonassociate \( a \in R \setminus \{0\} \) such that \( N(a) \leq g_F \) (see Lemma 3). Put

\[
b_j = \left( g_F \max \left\{ |a_j^{(k)}|^{-d} |l = 1, \ldots, s; k = 1, \ldots, r \} \right\}^{1/e_j} \quad (j = 1, \ldots, r).
\]

Apply Lemmas 1 and 2 to find \( v_1, \ldots, v_r \) in the set \( U(b_1, \ldots, b_r) \). (Remark. As the bounds \( b_1, \ldots, b_r \), given in C 1 may be much too large, one should first compute the units \( u \in U(b_1, \ldots, b_r) \) with small \( v_1(u), \ldots, v_{r-1}(u) \).)
\end{itemize}

</table>

C 2. (Computation of the set $U' = U(\overline{v}_1, \ldots, \overline{v}_n).$) The set $U'$ is computed by applying Lemmas 1 and 2.

C 3. (Computation of the sequence of successive minima of the absolute values of the conjugates of $u^{-1}, u \in U'$. Do steps C 3.1, C 3.2, C 3.3 for $i = 1, \ldots, r$, and then go to step C 4.)
A METRIC INVARIANT OF AN ALGEBRAIC NUMBER FIELD

3.1 (Initialize). Put \( k = 1 \) and \( a_{i,1} = \min \{|u^{(i)}|^{-1} | u \in U'\} \).

3.2 (Finding candidates for the next successive minimum). Define \( A_{i,k} = \{ |u^{(i)}|^{-1} | u \in U' \text{ and } 1 \leq |u^{(i)}| < a_{i,k}^{-1} \} \).

3.3 (Recurrence step). If \( A_{i,k} = \emptyset \), put \( q_i = k + 1 \), \( a_{i,k+1} = 1 \), and take the next \( i \). If \( A_{i,k} \neq \emptyset \), put \( a_{i,k+1} = \min A_{i,k} \), set \( k = k + 1 \), and go to 3.2.

4. (Definition of the set \( A \)). Define

\[
A = \left\{ (a_1, \ldots, a_r) \in \prod_{i=1}^r \{a_{i,1}, \ldots, a_{i,q}\} \mid \max\{a_1, \ldots, a_r\} = 1, \right.
\]

\[
\max\{|u^{(1)}|a_1, \ldots, |u^{(r)}|a_r\} \geq 1 \text{ for all } u \in U'. \left. \right\}
\]

5. (Final step.) Put \( c_F = (\min[\prod_{i=1}^r a_i^{s_i} \mid (a_1, \ldots, a_r) \in A])^{-1/d} \). (Remark. In some special cases one need not test every \( (a_1, \ldots, a_r) \in A \) in order to find \( c_F \); e.g., using the Galois group of \( \mathbb{Q}(n) \) in the examples mentioned below, one may restrict oneself to the case \( a_1 = 1 \).)

4. Examples. In this section we give the results of the computation of the constant \( c_{\mathbb{Q}(n)} \) of some cyclotomic fields \( \mathbb{Q}(n) \). For brevity we write \( u_{\rho,j} = |u_{\rho,j}^{(j)}| \), where \( u_1, \ldots, u_{m-1} \) \( (m = \varphi(n)/2) \) is the fundamental system of units of \( \mathbb{Q}(n) \) which is described in the second column of Table 2 (here we write \( \omega_n^{(k)} = \xi_n^k + \bar{\xi}_n^{-k} \) and \( \xi_n \) denotes a primitive \( n \)-th root of unity); for these systems of fundamental units the reader is referred to [2, Kap. V], [4, pp. 91, 94], and [5, Kap. III, Satz 27], respectively. In order to fix the different embeddings of \( \mathbb{Q}(n) \) into \( \mathbb{C} \), the first three digits of the absolute values of the conjugates of \( u_1 \) are listed in the third column of Table 2. Finally the first seven digits of \( c_{\mathbb{Q}(n)} \) for \( 6 \leq \varphi(n) \leq 12 \) are given in the fourth column of Table 2.

Remarks. (i) In computing \( c_{\mathbb{Q}(n)} \), real numbers \( a \) and \( b \) with \( |a - b| < m \cdot 10^{-15} \) were regarded as being equal.

(ii) The computations were carried out partly on the TR 445 of the Universität Düsseldorf and partly on the CYBER 76 of the Universität Köln.

5. Remark on an Algorithm of W. E. H. Berwick. Let \( F \) be an algebraic number field, and let \( \sigma_1, \ldots, \sigma_r \) be a full set of representatives of nonconjugate embeddings of \( F \) into \( \mathbb{C} \). For \( \rho = 1, \ldots, r \), let

\[
U_{\rho} = \{ u \in U \mid |\sigma_i(u)| < 1 \text{ for all } i \neq \rho \},
\]

and choose \( u_{\rho} \in U_{\rho} \) such that

\[
|\sigma_{\rho}(u_{\rho})| = \min\{|\sigma_{\rho}(u)| \mid u \in U_{\rho}\}.
\]

One may ask whether or not the set \( \{u_1, \ldots, u_r\} \) contains a fundamental system of units of \( F \).

This question was answered in the affirmative by W. E. H. Berwick [1] for the case \( r = 3 \); in fact he proved that any two elements of the set \( \{u_1, u_2, u_3\} \) form a fundamental system of units of \( F \) (for an application of Berwick's algorithm see, e.g., [12]). However, it was conjectured (e.g., [11, p. 6.09]) that the answer to the above question should be no if \( r > 3 \). The following examples show the truth of this
conjecture: Let $V_n$ be the subgroup of $U_n$ (see the remark following Lemma 1) generated by $W_n$ and the conjugates of a unit $u \in U_n$ with the properties

(i) $|u^{(j)}| < 1$ for all $j > 1$,

(ii) $|u^{(1)}|$ minimal among all units in $U_n$ which satisfy (i).

In the examples mentioned below $u$ is unique up to roots of unity, and it is plain that Algorithm C also gives the unit $u$. The index $(U_n : V_n)$ for some $n$ is listed in Table 3.
