In science, technology, engineering, finance, medicine, research, education — over a million professionals and students now rely on Mathematica to do their work.

For projects large and small, from initial concept to final report, Mathematica has defined the state of the art in technical computing for over a decade.

**NUMERICAL COMPUTATION**
World’s most complete collection of mathematical functions • Unlimited numerical precision • Matrix and tensor operations • Ordinary and partial differential equations • Fourier transforms • Data manipulation, fitting, and statistics • Root finding • Optimization • Number theory

**SYMBOLIC COMPUTATION**
State-of-the-art computer algebra algorithms • Simplification • Polynomial factoring and manipulation • Symbolic integration • Algebraic and differential equation solving • Symbolic matrix operations • General list and string processing

**ADVANCED LANGUAGE**
Award-winning intuitive symbolic language • Procedural, functional, list-based, rule-based, and object-oriented programming • Uniform symbolic expression representation of all objects • Fully scalable from small to large programs

**GRAPHICS AND SOUND**
2D, 3D, contour, and density plots • General 3D object visualization • Animation • Sampled sound • High-level symbolic graphics description language • Resolution-independent PostScript output • Export and import of standard graphics formats

**PROGRAMMABLE INTERFACE**
Customizable palettes • Free-form 2D input • Complete math notation • 700+ math and other characters • Programmable notation rules

**NOTEBOOK DOCUMENTS**
Interactive documents with text, graphics, sound, and math • Publication-quality editable typeset formulas and tables • Full range of formatting options • Automatic optimization for screen and print • Export capabilities in TeX, HTML, and more • Fully programmable symbolic representation • Free MathReader®

**SYSTEM FEATURES**
100% platform independent • Microsoft Windows, Macintosh, Unix/X • Unicode support • General MathLink® API • Distributed computing

**APPLICATIONS LIBRARY**
Over 30 products now available in data analysis, wavelets, time series, optics, astronomy, control systems, mechanical systems, structural mechanics, electrical engineering, finance, education, and more

**FULL SERVICE**
3000+ pages of award-winning online documentation • Three levels of technical support and consulting • 200+ books available • Volume discounts • Flexible academic site programs • Versions for students and teachers

Information and purchases: www.wolfram.com/v3/nms
or call 1-800-537-8075

All Mathematica products are available for Microsoft Windows, Macintosh, and most Unix platforms.
Monge Ampère Equation: Applications to Geometry and Optimization
Luis A. Caffarelli, New York University, Courant Institute, and
Mario Milman, Florida Atlantic University, Boca Raton, Editors

In recent years, the Monge Ampère Equation has received attention for its role in several new areas of applied mathematics:

- As a new method for discreteization for evolution equations of classical mechanics, such as the Euler equation, flow in porous media, Hele-Shaw flow, etc.
- As a simple model for optimal transportation and a div-curl decomposition with affine invariance and
- As a model for front formation in meteorology and optimal antenna design.

These applications were addressed and important theoretical advances presented at a NSF-CBMS conference held at Florida Atlantic University (Boca Raton), L. Caffarelli and other distinguished specialists contributed high-quality research results and up-to-date developments in the field. This is a comprehensive volume outlining current directions in nonlinear analysis and its applications.

Contemporary Mathematics, Volume 236; 1999; 172 pages; Softcover; ISBN 0-8218-0917-2; List $39; Individual member $23; Order code CONM/236

Mirror Symmetry and Algebraic Geometry
David A. Cox, Amherst College, MA, and Sheldon Katz, Oklahoma State University, Stillwater

This book is the first completely comprehensive monograph on mirror symmetry, covering the original observations by the physicists through the most recent progress made to date. Subjects discussed include toric varieties, Hodge theory, Kähler geometry, moduli of stable maps, Calabi-Yau manifolds, quantum cohomology, Gromov-Witten invariants, and the mirror theorem.

Mathematical Surveys and Monographs; 1999; 467 pages; Hardcover; ISBN 0-8218-1019-3; List $99; All AMS members $64; Order code SURV-101

Mirror Symmetry III
Duong H. Phong, Columbia University, New York; Luc Vinet, University of Montreal, PQ, Canada, and Shing-Tung Yau, Harvard University, Cambridge, MA, Editors

This book presents surveys from a workshop held during the summer in geometry and topology at the Centre de recherches mathématiques (CRM, University of Montreal). The volume is in some sense a sequel to Mirror Symmetry I (1998) and Mirror Symmetry II (1999), co-published by the AMS and International Press.

Included are recent developments in the theory of mirror manifolds and the related areas of complex and symplectic geometry. The long introductory articles explain the key physical ideas and motivation, namely conformal field theory, supersymmetry, and string theory. Open problems are emphasized. Thus the book provides an efficient way for a very broad audience of mathematicians and physicists to reach the frontier of research in this fast expanding area.

This book is co-published by the AMS, International Press, and Centre de Recherches Mathématiques.

AMS/IP Studies in Advanced Mathematics, Volume 10; 1999; 312 pages; Hardcover; ISBN 0-8218-1193-2; List $52; All AMS members $42; Order code AMS/IP/10

Introduction to Geometric Probability
Gian-Carlo Rota, Massachusetts Institute of Technology, Cambridge

This lecture examines the notion of invariant measure from a fresh viewpoint. The most familiar examples of invariant measures are area and volume, which are invariant under the group of rigid motions. Master expositor Gian-Carlo Rota shows how, starting with a few simple axioms, one can concoct new invariant measures and explore their properties. One set of such measures, known as the intrinsic volumes, are quite new and still somewhat mysterious. However, they have intriguing probabilistic interpretations and in fact can be shown to form a basis for the space of all continuous invariant measures.

Rota also discusses the remarkable connection between the intrinsic volumes and the Euler characteristic. Reaching deep ideas while remaining at an elementary level, this lecture would be accessible to undergraduate mathematics majors.

1998; NTSC format on one-half inch VHS videotape, approximately 60 minutes; ISBN 0-8218-1351-X; List $49.50; Individual member $34.95; Order code VIDEO/10/1351-N

Multichannel Optical Networks: Theory and Practice
Peng-Jun Wan, Illinois Institute of Technology, Chicago, Ding-Zhu Du, University of Minnesota, Minneapolis, and Panos M. Pardalos, University of Florida, Gainesville, Editors

This book surveys the TDM and WDM technologies and their applications in optical networks. These technologies have rapidly evolved from a theoretical concept to a commercially successful technology, with numerous applications. The book contains surveys on the latest theoretical and algorithmic aspects of these technologies. It also provides a good overview of the major problems (e.g., wavelength assignment, lightpath establishment, routing and wavelength assignment, etc.) and recent results on these problems.

Selections from MSRI's Video Archive, Volume 2
The Charn Symposium, March 5–7, 1998
A publication of MSRI.

This CD-ROM features video presentations from the Charn symposium on geometry sponsored jointly by the University of California at Berkeley (MSRI). The presentations were given at the symposium held at the University of California at Berkeley in 1998. The CD-ROM includes video presentations of selected talks given at the symposium. The video presentations are available in QuickTime format.

Regulators in Analysis, Geometry, and Number Theory
A. Reznikov, Ecole Polytechnique, Palaiseau & N. Schappacher, UFR Mathématiques et Informatique, Strasbourg, both, France

Presents refereed papers written by experts in their respective fields, based on the proceedings of the Jerusalem Regulator Conference, covering a broad range of topics from analysis, geometry, and number theory.

Contents: Foreword/ H. Parkes • Introduction/ A. Reznikov & N. Schappacher • Cohomology of Congruence Subgroups of SU(1,1) and Hodge Cycles on Some Special Complex Hyperbolic Surfaces/ D. Bistis & J.J. Rogawski • Remarks on Elliptic Motives/ E. Billo • On Dynamic Systems and Their Possible Significance for Arithmetic Geometry/C. Deninger • Algebraic Differential Characters/ H. Eicke • Computations in Weight 4 Motivic Cohomology/ V. Gritsch • Geometry of the Triogalith/ A. Goncharov • Complex Analytic Torsion Forms for Torus Fibrations and Moduli Spaces/ X. Gauthier • Théorèmes de Lefschetz et de Hodge Arithmétiques pour les Variétés Admettant une Décomposition Cellulaire/ K. Fünnemann & V. Maillot • Polylogarithms on Abelian Varieties/A. Levin • Secondary Analytic Indices/ S. Lett • Elliptic Modular Units/ S. Wildenhain

$79.50 (tent.)

New!

The Radon Transform
Second Edition
S. Helgason, MIT, Cambridge, MA

Introduces the Radon transform and presents new material on the d-plane transform and applications to the wave equation. Places the Radon transform in a general framework of integral geometry known as a duality in integral geometry. Generalized Radon Transforms and Orbital Integrals • The Radon Transform on Two-Point Homogeneous Spaces • Orbital Integrals and the Wave Operator for Anisotropic Lorentz Spaces • Fourier Transforms and Distributions: A Rapid Course

$79.50 (tent.)

Small Steps

The Notices is taking some small steps to make the information it contains better organized and more useful to readers.

Some of the changes affect the three monthly news columns “Mathematics People”, “Mathematics Opportunities”, and “For Your Information”. Years ago the Notices had a column of personal items that reported promotions, new jobs, certain honors, and miscellaneous other information about its members. As the AMS membership grew larger, the reporting of this information became an unwieldy task, and eventually that kind of reporting was abandoned. In its place eventually was the column “Mathematics People”, which has evolved to the point that it reports on national and international awards and honors in mathematics and certain other awards and honors that extend outside of mathematics. This column also includes a list of death notices of AMS members, continuing a long tradition. “Mathematics Opportunities” lists information about fellowships, grants, competitions, and the like, while “For Your Information” includes news about other kinds of things—events, activities, the AMS, and related organizations. Announcements of conferences generally appear in the “Mathematics Calendar” rather than in “For Your Information”. News of any kind that is proposed for inclusion may be sent to the managing editor, e-mail: notices@ams.org.

Apart from the evolution toward the current roles of the three news columns, one more change has occurred with these columns. Starting in 1999, seventeen selected mathematics institutes around the world will be offered space within “Mathematics Opportunities” throughout each year to describe their future programs and application procedures.

Annually the Notices has published certain lists of information prepared by the AMS staff. These include the lists of doctorates, of foreign visitors, of backlogs of research journals, and of a few other items. These lists will now be organized so they appear right after the three news columns.

The department “Reference” will continue to tell where to find the latest version of certain kinds of slowly varying information, such as lists of AMS officials and the list of current program directors in mathematics at the NSF. Changes for this section include the addition of a book list and changing the name of the section to “Reference and Book List”.

In the recent past the Notices has published book reviews at the rate of approximately one per issue. The books that are reviewed represent a selection of the books that come to the attention of the editorial board and meet certain criteria, including the following: (i) The book must have mathematical themes and must hold appeal for a wide audience, including mathematicians and students. (ii) The book must normally be neither a textbook nor an advanced book of the kind that is reviewed. (iii) The book must appeal for a wide audience, including mathematicians and students. (iv) The book must be written in English.

One last change worth mentioning is in the way the bibliography is listed at the end of articles. Anyone who has ever written an article for an AMS journal knows that the AMS has its own conventions for what fonts to use in references. Article titles have been in italics, journal titles in roman, and so on. Most non-AMS journals, by contrast, put article titles in roman, journal titles in italics, and so on. The Notices has been faced with the problem that its articles do not contain just text and bibliographies, but they can contain annotated bibliographies, footnotes with references, footnotes with references and text, and references that are given in the text. The handling of references in the Notices thus has to be made consistent with the handling of titles in the text, and therefore the Notices departed from the AMS tradition with the January 1999 issue. Henceforth, references in the Notices will be in a form closer to that of most non-AMS journals throughout the part of the world that uses the Latin alphabet.

—Anthony W. Knapp
In My Opinion

Compute and Conjecture

When I was a mathematical child, abstraction was king. In algebra (my field, and one I will concentrate on here) I was taught commutative algebra before I knew what a number field was. Galois theory was abstract structure; actual groups and fields did not appear until after the proof of the fundamental theorem.

It was as if examples were the detritus, and proof and theorem the real thing. Computation was for those who could not think abstractly—and we all knew that mathematics was abstraction. (This was most obvious in the differential equations course, where existence proofs formed the basis of the math department's offering. Learning to solve them was relegated to engineering.) Examples served to illustrate results and were not a way of doing mathematics. They did not guide research, or its direction, or lead to conjectures.

Before this century mathematicians computed aplenty. From Pythagoras to Archimedes, the Greeks calculated. Astronomical reckonings drove much of Newton's, Euler's, Gauss's, and Poincaré's work. Euler computed his way to quadratic reciprocity. Gauss's extensive calculations led him to the prime number theorem. Based on computational work, Dedekind and Frobenius conjectured many results concerning group representations. Ramanujan used calculations to guide his many conjectures. But after Hilbert demonstrated the power of abstract methods in the basis and syzygy theorems and the Nullstellensatz, computation fell out of favor. Noether's work furthered the ascendancy of abstract methods. Abstraction replaced computation, and mathematics grew richer—but poorer too.

Abstract understanding is like viewing terrain through a satellite map, while examples show what the land is really like under your feet. Research benefits from both approaches. Knowing the terra firma often demonstrates why and where the theorem is true. Computation can help uncover surprising connections, and it can uncover fruitful areas for study.

Knowledge of the individual examples has always been crucial to group theory. It led, for example, to Burnside's conjecture (now the Feit-Thompson theorem) that every simple nonabelian group is of even order. More recently Tits's theory of buildings was derived from an intimate under-

standing of the structure of many groups. Birch and Swinnerton-Dyer used their knowledge of many elliptic curves obtained by extensive calculations to hone their famous conjecture. And people found questions to ask about the Mandelbrot set by looking at the pictures—then they went and proved theorems.

If for most of this century computation was held in low esteem, now the pendulum appears to be swinging back. It is doing so at a propitious time. Although mathematics has grown more complex than a century ago, we have more computational machinery than our predecessors did.

Symbolic computation packages such as AXIOM, Derive, GAP, Grobner, Macaulay, MAGMA, Maple, Mathematica, Pari/GP, and Singular$^2$ have made many calculations far easier to perform. Systems developed by mathematical computer scientists and computational mathematicians enable us to easily factor polynomials, solve systems of polynomial equations, compute Galois groups, build groups out of smaller ones (e.g., compute wreath products), calculate the primary decomposition of an ideal, perform arithmetic in rational function fields, compute algebraic varieties, enumerate the partitions of a set, construct Goppa and Reed-Muller codes, build graphs out of smaller ones, do symbolic splitting in symbolic dynamics, compute limits, Taylor series, and Laplace transforms, and exactly solve ODEs and PDEs. One can check whether a polynomial is irreducible over $Q$, compute its Galois group, find subgroups of the Galois group, then compute the corresponding subfields of the splitting fields. In the finite case, one can construct a group from a set of generators and determine its commutator subgroup and its Sylow subgroups. One can construct a graph, determine its automorphism group, and then construct the composition factors of the automorphism group. All of this can be done easily using various symbolic computation programs. (In a satisfying cross-fertilization, the work in symbolic computation has led to new mathematical results in algebra, analysis, combinatorics, and logic.)

In Hilbert's time multivariate computations grew too quickly to be computed by hand; now many of these problems can be easily done by computer. We can solve harder problems, in extensions of higher degree, with more variables than we could handle a decade ago.

Computation and examples enrich and guide research as much as they do teaching. At a time when mathematicians are returning to computation, computers and symbolic computation programs are giving mathematicians an exciting opportunity to expand their research capabilities.

—Susan Landau
Associate Editor

$^1$ Gauss had a very modern view of computational complexity. In Art. 329 of Disquisitiones, which is about factorization, he carefully distinguishes primality testing from factorization and says things like "It is in the nature of the problem that any method will become more prolix as the numbers get larger. Nevertheless, in the following methods, the difficulties increase rather slowly, and numbers with 7, 8, or even more digits have been handled with success and speed beyond expectation ....".

$^2$ See http://symbolicnet.mcs.kent.edu/www-sites.html#A1.1 for a partial listing of symbolic computation systems.
Letters to the Editor

Impostures Intellectuelles and Faris's Review

I was very interested in the book review article by William G. Faris of *Impostures Intellectuelles* (Editions Odile Jacob, Paris, 1997) by Alan Sokal and Jean Bricmont in the August 1998 issue of the *Notices* (Vol. 45 pp. 874–876). The reason for my interest is the following point:

"The major gap in the Sokal-Bricmont book is that it avoids dealing with...the confusion over the foundations of quantum mechanics. This confusion is a major weakness of modern physics science. Numerous popular writings about science exploit this obscurity, but the book does not address this issue."

To the best of my knowledge, no other reviewer made this important point, and I suggest that this is a grave omission by both the Sokal-Bricmont book and its numerous reviews.

It is generally believed that postmodernism was originated by culture studies in the revolutionary ambience of 1960s' France. But from which prior paradigms might the French postmodernists have derived their now rightly recognised as daft ideas? Might they have been influenced by the philosophical utterances of earlier eminent mathematicians and scientists (mostly quantum physicists)? I have argued that this is indeed the case. The following passages are conveniently taken from a single source, Alan L. Mackay's *A Dictionary of Scientific Quotations* (Adam Hilger, Bristol, 1991):

Niels Bohr: "...two sorts of truth: trivials, where opposites are obviously absurd, and profound truths, recognised by the fact that the opposite is also a profound truth."

J. B. S. Haldane: "The universe is not only queerer than we suppose, but queerer than we can suppose."

David Bohm: "There are no things, only processes."

Hermann Bondi: "Science doesn't deal with facts; indeed, fact is an emotion-loaded word for which there is little place in scientific debate."

Bertrand Russell: "Mathematics may be defined as the subject in which we never know what we are talking about, nor whether what we are saying is true."

G. H. Hardy: "Beauty is the first test; there is no permanent place in the world for ugly mathematics."

Paul Dirac: "It is more important to have beauty in one's equations than to have them fit experiment."

Arthur Eddington: "It is also a good rule not to have overmuch confidence on the observational results that are put forward until they are confirmed by theory."

Albert Einstein: "Imagination is more important than knowledge."

Freeman Dyson: "Most of the papers which are submitted to the Physical Review are rejected, not because it is impossible to understand them, but because it is possible. Those which are impossible to understand are usually published."

Fred Hoyle: "[We must] recognise ourselves for what we are—the priests of a not very popular religion."

Before any mathematicians and scientists (and especially quantum physicists) dare to accuse any others of the very serious charge of intellectual imposture, they first ought to put their own houses in order.

More History of the Chowla-Selberg Formula

Although the authors of the Chowla memorial article (Notices, May 1998) did not want to pursue the history of the Chowla-Selberg formula, there is more to it than is indicated in the exchange of letters in the September Notices. The relevant information can be found in section 3.2 of N. Schappacher's book *Periods of Hecke Characters* (Lecture Notes in Mathematics, vol. 1301, Springer-Verlag).

It seems that historically there were two lines of investigation connected with the formula. One involves examples due to Legendre and Eisenstein, and Chowla and Selberg were aware of this part of the history. But the formula itself was discovered about fifty years before the first article of Chowla and Selberg. Building on work of Berger and Kronecker, M. Lerch proved the Chowla-Selberg formula in an article "Sur quelques formules relatives au nombre des classes" (Bull. Sci. Math. (2) 21 (1897), prem. partie, 290–304).

In a 1903 paper Landau proved a formula that implies the Lerch result, and then Schappacher is able to find no reference to the Lerch or Landau result in the literature between 1903 and the first paper of Chowla and Selberg in 1949. This historical information came to light when R. Szczep pointed out the Landau paper to Schappacher.

Schappacher goes on to describe how Well looked, with only partial success, for a geometric proof of the formula, at least up to a rational factor, and then how B. H. Gross found the result mentioned in the September letter by McGuinness. More precisely, the method of Gross recovers the formula only up to a rational factor. This factor was determined by P. Colmez ("Périodes des variétés abéliennes à multiplication complexe", Ann. of Math. 138 (1993), 625–683), using the theory of $p$-adic periods.

Consider Price When Adopting Textbooks

I would like to comment on Edwin Beschler's November article, "The Pricing of Scientific Publications", and the increasing trend of textbook prices in general. One aspect of commercial publishing which is avoided in Beschler's article is lower-division undergraduate textbook prices. His essay doesn't account for why a student pays $100 for a "best-selling" calculus text. Although these books usually contain more colors and pictures than the lower-selling advanced texts, they can be printed in much higher quantities and shouldn't have the same long-term storage costs. Moreover, since they are popular texts, it seems that the risk is much lower. In short, it appears that the total unit cost, etc., doesn't account for the price, and it

190

NOTICES OF THE AMS

VOLUME 46, NUMBER 2
seems to follow that publishers are indeed price gouging.

Notice that most of these popular texts are in multiple editions. Although it speaks well of the authors for writing books that stand the test of time, it appears that many of these texts undergo revision every two to three years. It follows that with every new edition, the bookstores' used inventories are wiped out, forcing students to purchase new books. Hence it is in the publisher's best interest to be in the process of constant revision and to urge departments to switch texts. I fear that much of the contention in recent years regarding reformed pedagogy and technology-based learning has been promoted, even fueled by publishers. Authors are perhaps pressured to write specialized variations of their textbooks to accommodate specific calculators, classical and reformed teaching styles, single-semester and tracked courses, etc., thus again hampering and complicating the used-book market and passing a further expense on to the students.

I would like to urge teachers and book search committees in general to be more mindful of the extra expense their students incur when they switch either texts or editions and perhaps to factor into their choice the expected duration that a book, as is, will remain in print. We shouldn't be anti-publisher, but contrary to the tone of Beschler's article, they need us as adopters, their main in print. We shouldn't think that our book reps are doing us any favors. As teachers we have the opportunity and obligation to respond as consumers even though we aren't the ones consuming.

—Jeffrey Humpherys  
Indiana University, Bloomington  
(Received November 5, 1998)

Beschler Replies

As a parent currently putting his third child through college, I cannot help but share Jeffrey Humpherys's consternation at $100 textbooks. In the limited space available to me, I did indeed skirt that issue in favor of an emphasis on short-run, research-level books, which share some dynamics with journals.

My main objection to Humpherys's letter is that it again places all the blame on publishers, as though authors and the educational establishment had nothing to do with the requirements that have been put on textbooks to make them acceptable, as though the publishers create these "products" and the captive market has no choice but to pay the bill for them. There is something fundamentally wrong with this picture. There is no doubt that some publishers some of the time reap excessive profits on some of their products. Others settle for less. I should also mention that, since textbooks at the calculus level are not usually published by university presses, the comparison between profit and nonprofit organizations does not apply here. But the principle of attempting to profit on investment, as any business must, remains intact.

Some of the investment that goes into a textbook includes: extensive reviews to determine that the book has all the qualities of the market leader and surpasses them; supplemental material that accompanies the book gratis (answer manuals, teachers' manuals, tapes, CDs, videos, etc.); competitive royalties to attract the author in the first place; copious numbers of free copies to potential adopters; extensive sales forces to bring the wonders of this new "product" to the ears of adoption committees already deluged by similar presentations; marketing "gimmicks" to further increase visibility; and so on. In addition there are such items as checking to ensure that no words in the text exceed a certain presumed reading level, all concepts included are "politically correct", and other excesses at the extreme end of what is happening in textbook publishing. All of these activities are aimed to penetrate a market that has been shaped by the educational establishment and its perceived needs. They are in answer to what the market continually demonstrates that it wants.

A great deal of this investment must be recouped during the first year of a textbook's expected life, since the used-book marketers have greatly developed their ability to collect used copies and direct them to the most likely re-users. In addition, the same investment must be made for a textbook that fails to capture a significant part of the market and whose costs must therefore be subsumed within the economics of the successful ones. The fact that most books lose money and are subsidized by the few that succeed is well known in all areas of market-driven publishing.

If the educational establishment wishes to change the rules of the game, it will follow as the night the day that publishers will adapt. Pressure on authors and urgent arguments to adopting committees are part of the dynamics, but without willing cooperation of these partners in the enterprise, publishers would be powerless. In the end, I agree with Humpherys that the teachers, albeit not being the consumers themselves, ought to be the primary voice in determining what tools they want in the teaching of our children. How they can best exercise their "responsibility and obligation" in this process ought to be the subject of ongoing debate within the educational establishment and should involve the publishers. To paraphrase a comment from my article, "If commercial publishers are part of the problem, they CAN also be part of the solution."

Introduction

Interpolation with polynomials is a subject that has occupied mathematicians' minds for millennia. The general problem can be informally phrased as: Given a set of points \((x_i, y_i)\) in the plane, find a polynomial \(f(x, y)\) with these points as roots. (The one-variable version of this problem is easy and crops up in the high school and undergraduate curriculum on occasion.) Sometimes one asks for a polynomial of minimal degree that works. The condition to pass through a point is a linear one, and so a more sophisticated version of the interpolation problem asks for the vector space of all interpolating polynomials whose degree is bounded by a particular integer.

In this article I want to draw the reader's attention to the dimension of such a space. It turns out that if the points are in very special positions, the interpolation conditions may be dependent, which complicates the problem, of course. We then make the blanket assumption that the points are in general position, which insures that the interpolation conditions are independent; but then, as one realizes immediately, the dimension question is trivial: the codimension of the space of interpolating polynomials is equal to the number of points being imposed.

We therefore complicate the problem by requiring a more subtle form of interpolation: for each point \(p\) we fix an integer \(m\) (depending on \(p\)) and require that the polynomial not only vanish at \(p\), but vanish "to order \(m\)"; it and all of its derivatives up through order \(m - 1\) also vanish at \(p\). We often say that the polynomial has multiplicity \(m\) at \(p\) if it vanishes to order \(m\).

This more general problem, even for points in general position, turns out to be surprisingly complicated. The number of conditions imposed by asking a polynomial \(f(x, y)\) to vanish to order \(m\) at \(p\) is \(m(m + 1)/2\); this is just the number of terms in the Taylor expansion of \(f\) at \(p\) up through order \(m - 1\), and all of these coefficients must vanish. So the naive conjecture would be that the codimension of the space of interpolating polynomials vanishing to order \(m\) at \(p\) is equal to \(\sum m_i(m_i + 1)/2\) (unless, of course, the interpolating space is empty); this gives the "expected" dimension, assuming that all the linear conditions being imposed are independent.

This naive conjecture is false, as some easy examples show. The simplest is to consider the space of conics having multiplicity two at each of two points \(p\) and \(q\). The vector space dimension of conics is six, and each multiplicity-two point gives three conditions, so one expects there to be no nonzero conics double at the two points. However, if \(e(x, y)\) is the linear polynomial defining the line through \(p\) and \(q\), then \(e(x, y)^2\) is a nonzero conic double at \(p\) and \(q\).

The real conjecture, due to Harbourne and Hirschowitz in the mid-1980s, states that if the space of interpolating polynomials does not have the expected dimension, then there is a polynomial \(e(x, y)\) such that every interpolating polynomial is divisible by \(e(x, y)^2\). Moreover, the polynomial \(e(x, y)\) has a special form, which will be exposed later.

Although the conjecture is rather recent, the general problem goes back to the last century, more or less to the origins of algebraic geometry. Bézout
in the 1700s; Plücker, Bertini, and M. Noether in the 1800s; and Terracini, Castelnuovo, Segre, and Severi in this century all made contributions, among many others. Coolidge's treatise [Co] makes for interesting reading even today.

My purpose in writing this article is to pique the interest of Notices readers in this curious situation and to explain some of the methods leading to the conjecture. Along the way I shall discuss some of the variations and applications of the conjecture (in particular, the higher-dimensional analogue of the problem and its relationship to Waring's problem for forms) and give an impression of some recent results.

**Basic Definitions**

**The Projective Space of Plane Curves**

We regard the underlying field as the complex numbers. Informally, an algebraic curve in the projective plane is given by the vanishing of a nonzero polynomial \( f(x, y) = 0 \). This is a bit dangerous if we want to focus on the polynomials themselves, since the set of zeroes of the polynomial does not determine the polynomial; for example, \( f \) and \( f^2 \) have the same zeroes. The only ambiguity not affecting later computations is multiplication of the polynomial by a nonzero constant. We therefore define an algebraic plane curve (of degree \( d \)) to be an equivalence class of nonzero polynomials of degree at most \( d \), two being identified if they are scalar multiples of one another. Such polynomials, including the zero polynomial, form a vector space of dimension \( (d^2 + 3d + 2)/2 \), which is the number of monomials in \( x \) and \( y \) of degree at most \( d \).

With this definition, we see that the space of plane curves is naturally a *projective space*, that is, the space of 1-dimensional subspaces of the vector space of polynomials of degree at most \( d \). The dimension of a projective space is always one less than that of the corresponding vector space. A single point has dimension 0 and the empty set, projectively, has dimension \(-1\). The projective space of 1-dimensional subspaces of \( \mathbb{C}^{d+1} \) is denoted by \( \mathbb{P}^d \).

Therefore the projective space \( L_d \) of plane curves of degree \( d \) has dimension \( d(d+3)/2 \).

A *component* of a curve \( C \), with defining polynomial \( f \), is the curve associated to any nonconstant factor of \( f \); a curve is *irreducible* if its defining polynomial cannot be factored. Geometrically every curve is the union of its irreducible components.

**Plane Curves Interpolating Points with Multiplicity**

Fix a point \( p \) in the plane, and denote by \( L_d(-mp) \) the set of plane curves of degree \( d \) which have multiplicity at least \( m \) at \( p \). Having multiplicity at least one at \( p \) is equivalent to the curve passing through \( p \).

As noted above, for a curve \( C \) defined by \( f(x, y) = 0 \) to have multiplicity at least \( m \) at \( p \) is exactly \( m(m+1)/2 \) independent linear conditions on the coefficients of \( f \), as long as the degree of \( f \) is at least \( m - 1 \). Therefore the set \( L_d(-mp) \subseteq L_d \) is either empty (if \( d \leq m - 1 \)) or has codimension \( m(m+1)/2 \).

Suppose now that \( p_1, \ldots, p_n \) are distinct points in the plane and that \( m_1, \ldots, m_n \) are nonnegative integers. Define

\[
L_d\left(-\sum_{i=1}^n m_i p_i\right) = \{ C \in L_d(-m_i p_i) \text{ for every } i \}
\]

\[
= \bigcap_{i=1}^n L_d(-m_i p_i)
\]

to be the space of plane curves of degree \( d \) having multiplicity at least \( m_i \) at \( p_i \) for each \( i \). This is a linear subspace of \( L_d \), called a *linear system* of plane curves. The problem we have set ourselves to investigate is, What is the dimension of the linear system \( L_d(-\sum_{i=1}^n m_i p_i) \)?

**The Virtual and Expected Dimension**

As noted above, one knows that for each point \( p \) the \( m(m+1)/2 \) conditions imposed by asking the curve to have multiplicity at least \( m \) are independent. However, if there is more than one point, it is not at all clear whether the totality of all these conditions at every point is independent.

If so, we have an easy formula for the dimension: If there are \( n \) points, define the virtual dimension of \( L = L_d(-\sum_{i=1}^n m_i p_i) \) by

\[
\nu = \nu_d\left(-\sum_{i=1}^n m_i p_i\right) = \frac{d(d+3)}{2} - \sum_{i=1}^n m_i(m_i + 1)/2.
\]

Note that if this number is negative, then we really expect the space \( L \) to be empty; hence we define the expected dimension of \( L \) to be

\[
\nu = \nu_d\left(-\sum_{i=1}^n m_i p_i\right) = \max\{-1, \nu\}.
\]

We note that

\[
\dim L_d\left(-\sum_{i=1}^n m_i p_i\right) \geq \nu_d\left(-\sum_{i=1}^n m_i p_i\right) \geq \nu_d\left(-\sum_{i=1}^n m_i p_i\right),
\]

since the failure of the conditions to be independent can only raise the dimension of the interpolating space. Notice that the second and third quantities are equal if either is at least \(-1\).

Whether this space of curves has the expected dimension depends on the positions of the points, even if all of the multiplicities are one.
the final equality holding because \( n \leq d(d + 3)/2 \). Hence we see in this case that the actual dimension is strictly greater than the expected dimension.

**Example 2.** Let \( C \) and \( D \) be two plane cubic curves which intersect nine times (this is forced by Bézout’s theorem, which we shall discuss below). Suppose in fact they intersect transversally (crossing each other with distinct tangents) at nine distinct points \( p_1, \ldots , p_9 \) (which happens generically, in fact). Consider the linear system \( \mathcal{L} = \mathcal{L}_3(\sum_{i=1}^9 p_i) \) of cubics through the nine points. Since we have by construction two such cubics, this linear space contains two elements and so must have dimension at least one. But \( v = 9 - 9 = 0 \), so that the expected dimension \( e \) is also zero. Hence, we again have the situation where the actual dimension is greater than the expected dimension. See Figure 1.

**Choosing Points Generically**

The previous examples have dimension greater than the expected dimension because the positions of the points are special in some way. To understand this phenomenon, it is useful to consider the linear system \( \mathcal{L}_d(\sum_{i=1}^n p_i) \), as a vector space of polynomials, to be the kernel of a linear map \( \phi \). This map \( \phi \) simply takes a polynomial \( f \) to a \( t \)-tuple (where \( t = \sum_{i=1}^n (m_i + 1)/2 \)) by evaluating \( f \) and all relevant derivatives at the points \( p_i \). The map \( \phi \) has a matrix when we use the basis of monomials \( \{ x^a y^b \} \) for the vector space of all polynomials of degree at most \( d \). In this basis, if \( p_i = (x_i, y_i) \), then the matrix for \( \phi \) has entries equal to the derivatives of the monomials \( x^a y^b \).

Let \( R_k \) be the set of all \( n \)-tuples of points \( (p_1, \ldots , p_n) \) where the above matrix has rank at most \( k \). We clearly have \( R_k \supseteq R_{k+1} \) for every \( k \); moreover, for large \( k \) we see that \( R_k = (\mathbb{P}^2)^n \), since as soon as \( k \) is larger than the size of the matrix, there is no condition on the points \( p_i \). Therefore, there is a maximum number \( r \) such that \( R_r \not= (\mathbb{P}^2)^n \), but \( R_{r+1} = (\mathbb{P}^2)^n \).

Suppose that the points \( \{ p_i \} \) are chosen so that \( (p_1, \ldots , p_n) \) does not lie in \( R_r \). Then the matrix for \( \phi \) has the maximum possible rank (namely, \( r + 1 \)) so that the dimension of the kernel has minimum possible dimension. The locus \( \mathcal{R}_r \) is a closed subset of \( (\mathbb{P}^2)^n \), defined by the vanishing of all \( (r + 1) \times (r + 1) \) minors of the matrix for \( \phi \), and has dimension strictly smaller than \( 2n \), which is the dimension of \( (\mathbb{P}^2)^n \). Therefore, we see that if we choose the \( n \)-tuples of points off this closed subset of lower dimension, the space \( \mathcal{L}_d(\sum_{i=1}^n p_i) \) achieves its minimum possible dimension, which we call the generic dimension for curves of degree \( d \) having the required multiplicities at the \( n \) points. For this problem, \( n \)-tuples of points off this closed subset will be said to be in general position.
The Multiplicity One Theorem
We can now address the situation that arose first in the introduction: the simple interpolation of polynomials, without higher multiplicities. In this case there are no surprises; all such systems have the expected dimension.

**Multiplicity One Theorem.** If the points \( \{ p_i \} \) are in general position, then the dimension of \( L_d(-\sum_i m_ip_i) \) is equal to the expected dimension.

**Proof:** We prove this by induction on the number of points \( n \). For \( n = 0 \) it is clear, and for \( n = 1 \) we are claiming that we can choose the point \( p_1 \) so that it does not lie on every curve of degree \( d \), which is obvious. For the general induction step, since each additional point contributes exactly one linear condition, all that is required is to show that this condition is not dependent on the previous conditions. This is equivalent to having each additional point not lie on every curve passing through the previous points. Of course, if the points are in general position, it will not: simply take any curve passing through the previous points and take as the additional point any point not on that curve.

First Examples of Special Systems
We say that a linear system \( L_d(-\sum_i m_ip_i) \) is special if it does not have the expected dimension; otherwise it is nonspecial. The Multiplicity One Theorem says that if all \( m_i \) are equal to one, then the system is nonspecial. A naive conjecture would be the analogue of the Multiplicity One Theorem: For generic choices of the points, the dimension of the system is equal to the expected dimension. As noted in the introduction, this is false, as the example of conics double at two points shows: \( \dim L_2(-2p - 2q) = 0 \), but the expected dimension is \(-1\).

Let us offer another example of a case where no matter how general the choice of the points is, the linear system is special.

**Example 3.** Choose five points \( p_1, \ldots, p_5 \) in the plane generically. Then \( \dim L_2(-\sum_i p_i) = 0 \) by the Multiplicity One Theorem, since the virtual dimension is \( 5 - 5 = 0 \): there is a unique conic through the five points. Let \( e \) be the quadratic equation defining this conic, and let \( f = e^2 \). Then \( f \) is a quartic, and as above the multiplicity of \( f \) is \( 2 \) at all points of the conic, in particular at each of the original five points. Hence \( L_4(-\sum_i 2p_i) \) is not empty. However, its virtual dimension is \( v = 14 - 5 - 3 = -1 \), and so the system is expected to be empty.

\((-1)\)-Curves

**Intersection Multiplicities**
To begin to understand the phenomenon of special systems, it is necessary to introduce the notion of intersection multiplicities between two curves. Briefly speaking, if two curves \( C_1 \) and \( C_2 \) meet at a point \( p \), we want to carefully count how many times they meet there. This is nothing more than a generalization of the multiplicity of a root of a single equation in one variable; here we have two equations in two variables. I do not want to enter into the technicalities in this article. One can consult [F] for an elementary treatment; suffice it to say that if the curves \( C_1 \) and \( C_2 \) do not have a common component passing through a point \( p \), then a nonnegative integer \( I_p(C_1, C_2) \) is defined that measures the “intersection multiplicity” we need. It satisfies the following properties:

- \( I_p(-,-) \) is bilinear over the integers,
- \( I_p(C_1, C_2) \geq 1 \iff p \in C_1 \text{ and } p \in C_2, \)
- \( I_p(C_1, C_2) = \text{mult}_p(C_1) \cdot \text{mult}_p(C_2), \)
- \( \sum_p I_p(C_1, C_2) = \deg(C_1) \cdot \deg(C_2). \)

The first three of these properties are not hard to understand. The first is quite natural: it says that if \( C \) meets \( D \) a total of \( r \) times at \( p \) and meets \( E \) a total of \( s \) times at \( p \), then it meets the union \( D + E \) a total of \( r + s \) times at \( p \). (Here the “sum” of two curves is given by the product of their defining functions.) The second simply indicates that \( I_p = 0 \) when \( p \) is not a root of both equations. The third generalizes the second: a curve \( C \) having multiplicity \( m \) at \( p \) is, generically, \( m \) branches, or separate smooth arcs, through \( p \). If \( C_1 \) has multiplicity \( m_1 \) at \( p \), then \( I_p(C_1, C_2) \) gets a contribution of at least one from each branch of \( C_1 \) meeting each branch of \( C_2 \).

The final property is more subtle and is Bézout's Theorem: the number of intersections is the product of the degrees, “counted properly”. Here counting properly means using the intersection multiplicity, and the sum is taken over all points in the projective plane, including, of course, whatever points at infinity are involved in the intersection. Bézout's Theorem holds only when the curves do not share a common component. It is the generalization to two variables of the fact that a polynomial in one variable of degree \( d \) has exactly \( d \) roots, counting roots according to their order.

**Extra Intersections**
Fix once and for all points \( p_1, \ldots, p_n \) in the plane. Consider a curve \( D \in L_d(-\sum_i m_ip_i) \) and another curve \( E \in L_d(-\sum_k k_ip_i) \): where do \( D \) and \( E \) meet? At one of the chosen points \( p_i \), \( D \) has multiplicity at least \( m_i \) and \( E \) has multiplicity at least \( k_i \), so that the third property of intersection numbers says that \( I_p(D, E) \geq m_i k_i \). Therefore we have at least \( \sum_i m_i k_i \) intersections all accounted for at the chosen points. The total number of intersections is, by Bézout's Theorem, the product of the degrees. Therefore it is natural to consider the number of “extra intersections” \( d - \sum_i m_i n_i. \)

This quantity has several advantages, the primary one being that it is bilinear (over the integers) in the given data (of degrees and multiplicities); in...
deed, it depends only on these data. We are inexorably led to giving these data lives of their own: let us define a curve class to be an \((n+1)\)-tuple of integers \((d; m_1, m_2, \ldots, m_n)\); these form a group under addition. If \(C\) is an actual curve in the plane, we say that \(C\) belongs to the curve class \((d; m_1, m_2, \ldots, m_n)\) if \(\deg(C) = d\) and the multiplicity of \(C\) at \(p_i\) is at least \(m_i\) for each \(i\).

Curve classes have associated linear systems (the space of curves \(L_d(-\sum_i m_ip_i)\), and derived from this they have virtual, expected, and actual dimensions. The first two of these are defined by (1) and (2) as earlier. The third is the generic dimension of \(L_d(-\sum_i m_ip_i)\) determined when the points are in general enough position.

Given two curve classes, we may define their \textit{extra-intersection number}, motivated by the discussion above: if \(d = (d; m_1, \ldots, m_n)\) and \(e = (e; n_1, \ldots, n_m)\) are two curve classes, define \((d, e) = de - \sum_i m_in_i\). This is a bilinear function of curve classes.

One immediate result is that if \(C\) and \(D\) are curves belonging to curve classes \(c\) and \(d\) respectively, and \((c, d) < 0\), then \(C\) and \(D\) must share a common component, since Bézout’s Theorem is failing to hold. If, for example, \(C\) is an irreducible curve, then in this case \(C\) must be a component of \(D\). We will often abuse the notation for the extra-intersection number slightly by applying it to actual curves instead of the curve classes; in this way we would write \((C, D)\) for \((c, d)\). We occasionally abuse the notation further and apply it to the linear systems \(L_d(-\sum_i m_ip_i)\) also.

The Genus Formula

Define the “canonical curve class” \(k = (-3; -1, -1, \ldots, -1)\); this has all negative data, but the opposite curve class \(-k = (3, 1, 1, \ldots, 1)\) is more easily understood: its linear system consists of cubic curves passing through all the points. There may not be any such curves, but the algebra of extra intersections does not really care.

With this class in hand, we have a formula for the virtual dimension of a curve class \(c = (d; m_1, \ldots, m_n)\), expressed entirely in terms of extra-intersection numbers:

\[
\nu(c) = \nu_d\left(-\sum_i m_ip_i\right) = \frac{(d+3)(d-2)}{2} - \frac{\sum_i m_i(m_i+1)}{2} = \frac{(c, c-k)}{2}.
\]

Here the difference \(c-k\) is the class with the difference of the data: \(c-k = (d+3; m_1 + 1, \ldots, m_n + 1)\). This formula happens to be a special case of the celebrated Riemann-Roch Theorem, but this fact will not concern us.

So far this extra-intersection number has not been useful in telling us anything we did not know already; let us remedy this. Recall that a smooth complex curve is a \textit{Riemann surface}, i.e., a closed one-dimensional complex manifold; as such it is a closed orientable real two-manifold, and topologically it may be described by its \textit{genus}.

A sphere has genus zero; examples are lines and conics in the plane. A torus has genus one: a smooth plane cubic curve is the prototype. If a curve \(C\) belonging to a curve class \(c\) is smooth and irreducible after resolving the singularities that are forced at the chosen points \(p_i\) with \(m_i \geq 2\), then it will also have a genus \(g\). The Genus Formula in the case that all of the singularities are ordinary (that is, each point of multiplicity \(m\) consists of \(m\) branches with distinct tangents) is

\[
g(C) = 1 + \frac{(c, C + k)}{2},
\]

which expresses the genus of \(C\) in terms of an extra-intersection number. The formula actually decomposes into

\[
g(C) = \frac{(d-1)(d-2)}{2} - \frac{\sum_i m_i(m_i-1)}{2},
\]

which some readers may recognize as a generalization of the famous Plücker formula, one of the cornerstones of surface theory.

For an irreducible curve \(C\), the genus must be nonnegative. If a class is encountered with negative genus (which is numerically possible), its linear system cannot contain irreducible curves.

\((-1)\)-Curves

The \textit{self-intersection} of a class \(c\) is the integer obtained by extra-intersecting \(c\) with itself: \((c^2) = (c, c)\). If \(c = (d; m_1, \ldots, m_n)\), then \((c^2) = d^2 - \sum m_i^2\). It can well happen that a curve class \(c\) has negative self-intersection, even if it is a curve class of a real curve! This may initially be disturbing, but if one thinks for a moment, there is no contradiction to Bézout’s Theorem. A simple example is a line through two chosen points, i.e., the curve class \((1; 1, 1)\). Another is a conic through five points; both these examples have \((C^2) = -1\).
These two examples are also extremal in the sense that they are both irreducible curves with zero genus, the minimum possible. Note from (4) that when \((C^2) = -1\) and \((C,k) = -1\), then we have a genus zero curve. The condition that \(g(C) = 0\) is equivalent to \((C,k) = -1\) if \((C^2) = -1\). Such curves, which are simple spheres after resolving the singularities, are called \((-1)\)-curves; every interesting extra-intersection number is \(-1\).

Some other interesting \((-1)\)-curves are cubics with one double point, passing through six other points. In general curves of degree \(e\) with one point of multiplicity \(e - 1\) and \(2e\) points of multiplicity one are \((-1)\)-curves. These are not the only types: sextics with one triple point and seven double points start another whole family. In general there are infinitely many sets of numerical data giving \((-1)\)-curves, although only finitely many with eight or fewer chosen points. There are already infinitely many with nine points alone.

The Main Conjecture

Generating Special Systems with \((-1)\)-Curves
Recalling two of our first examples of special systems, namely, conics double at two points and quartics double at five points, we see that each of these involves \((-1)\)-curves in an essential way: these systems are expected to be empty, but in fact each contains as its unique element the double of a \((-1)\)-curve. (The double of a curve is the curve defined by the square of the defining polynomial.) This turns out to be a critical observation and leads to the systematic generation of other special systems.

Indeed, suppose one wants to explore the generality of this type of example. We seek a curve \(E\) that exists whose double \(2E\) is not expected to exist. We obtain the following system of inequalities for the relevant extra-intersection numbers:

\[
\langle E^2 \rangle - \langle E,k \rangle \geq 0
\]

\(\langle E^2 \rangle\) is expected to exist, by (3)

\[
\langle E^2 \rangle + \langle E,k \rangle \geq -2
\]

\(\langle E^2 \rangle\) is a nonnegative genus, by the Genus Formula

\[
4\langle E^2 \rangle - 2\langle E,k \rangle \leq -1
\]

\(2E\) is not expected to exist, by (3).

The only solution to these inequalities is \((E^2) = (E,k) = -1\), forcing \(E\) to be a \((-1)\)-curve!

This little back-of-the-envelope calculation is not definitive but at least serves the purpose of focusing our attention on \((-1)\)-curves and the way they prevent linear systems from having the expected dimension. In the above example it is the linear system of the double class \(2E\) that visibly exists but is not expected to. It is not only the numerology of the \((-1)\)-curve, but also the fact that it occurs \text{dubiously} in the unexpected system that is important.

To see why this is true, suppose that a curve class \(C\) with linear system \(L\) has a negative extra-intersection number with a \((-1)\)-curve \(E\), say \((L,E) = -N\) with \(N \geq 1\). Since \(E\) is an irreducible curve, by Bézout's Theorem every member of the system \(L\) must contain \(E\) as a component. We can therefore remove \(E\) (subtracting the data of the degree and multiplicity of \(E\) from \(L\)) and obtain a residual class \(L' = L - E\). If \(N \geq 2\), the residual class also has \((L',E) < 0\), and so \(E\) will be removable again. Iterating the analysis implies that a total of \(N\) copies of \(E\) can be removed from \(L\).

Algebraically, this means that if the equation of \(E\) is \(f(x,y) = 0\), then \(f^N\) divides the equation of every member of \(L\).

Denote by \(M = L - NE\) the total residual system, obtained from \(L\) by removing all \(N\) copies of \(E\) from every member; then \((M,E) = 0\). A straightforward computation using the bilinearity of the extra-intersection number and (3) shows that

\[
v(M) = v(L) + N(N-1)/2.
\]

Notice that the actual dimensions of the two systems are the same: the elements of \(L\) differ from the elements of \(M\) only by the inclusion of \(NE\) as a component, which sets up an isomorphism between the two systems. Therefore, if \(N \geq 2\) and the system \(M\) has positive virtual dimension, we see that

\[
\dim(L) = \dim(M) \geq v(M)
\]

\[
= v(L) + N(N-1)/2 \geq v(L)
\]

and \(L\) is a special system, having dimension strictly greater than its virtual (and hence its expected) dimension.

Example 4. We can reverse this procedure and generate special systems more or less at will by adding in multiple \((-1)\)-curves. Take any non-empty linear system \(M\) and a \((-1)\)-curve \(E\) such that the extra-intersection number \((M,E) = 0\). Then the system \(L = M + NE\) is special for every \(N \geq 2\).

The special case when \(M\) is the trivial system gives the examples \(L = NE\), the special systems of multiple \((-1)\)-curves all by themselves.

One can iterate this and continue to add in multiple \((-1)\)-curves as long as one can find disjoint ones (disjoint in the sense of having extra-intersection number zero). A particularly spectacular example is afforded by considering the system \(L_{93}(57p_0 - \sum_{i=1}^{28} 26p_i)\) of curves of degree 93 with one point of multiplicity 57 and seven points of multiplicity 28. The virtual dimension of this system is \(93(96)/2 - 57(58)/2 - 7(28)(29)/2 = -31\), so that this is expected to be quite empty. How-
ever, as noted above, through seven general points there is always a cubic that is double at one and passes through the six others; and through eight general points there is always a sextic that is triple at one and passes through the seven others. Consider the seven cubics \( C_i, 1 \leq j \leq 7 \), with a double point at \( p_0 \) and passing through all of the other seven points \( p_i \) except for \( p_j \). Let \( S \) be the sextic triple at \( p_0 \) and double at the other seven \( p_i \)'s. Then the given system contains as a member the curve \( 5S + 3 \sum_{j=1}^{7} C_j \), and so is not empty at all! These eight curves \( S, C_1, \ldots, C_7 \) are all disjoint (-1)-curves (disjoint in the sense of having extra-intersection number zero).

For those readers who like this sort of thing, one might also consider the linear system \( L_{96}(\sum_{i=1}^{8} 34p_i) \) of curves of degree 96 with eight points of multiplicity 34. This system has \( v = -8 \), but there is a curve in the system! If one takes the eight sextics which are triple at one of the eight points and double at the other seven, adds them up, and doubles the result, the desired curve emerges.

**The Main Conjecture**

It is currently the case that the construction described above affords all known examples of special linear systems. Specifically, we have the following formulation:

**Main Conjecture.** If \( L = L_d(\sum m_p p_i) \) is a special linear system for generic points \( p_i \), then there is a (-1)-curve \( E \) such that \( (L \cdot E) \leq -2 \).

More precise versions of the Main Conjecture have been formulated by Hirschowitz in [Hi] and Harbourne in [Ha1] (see also [Ha2]).

Before proceeding to discuss what is known about the conjecture, let us consider some variations to put the problem in a broader context.

**Variations and Applications**

**The Generalization to Higher Dimension**

The general problem of computing the dimension of a space of polynomials satisfying certain multiplicity conditions at a set of general points can be formulated in any dimension, not just in the plane. Define \( L^{(r)}_d \) to be the projective space of polynomials (modulo scalars) of degree at most \( d \) in \( r \) variables; this is a projective space of dimension \( \binom{r+d}{r}-1 \). For a polynomial to have multiplicity at least \( m \) at a point \( p \), one has \( \binom{m+1+r}{r} \) conditions imposed (the number of Taylor coefficients of degree at most \( m-1 \)). If we denote by \( L^{(r)}_d(\sum_{i=1}^{n} m_p p_i) \) the space of polynomials of degree at most \( d \) in \( r \) variables having multiplicity at least \( m_i \) at \( n \) chosen points \( \{p_i\} \), the problem is to compute the dimension of this space when the points are chosen generically. As the above discussion indicates, we have a virtual dimension

\[
v = v_d^{(r)} \left( -\sum_{i=1}^{n} m_i p_i \right) = \left( r + d \right) - 1 - \sum_{i} \binom{m_i-1+r}{r}
\]

and an expected dimension \( e = \max\{-1, v\} \).

The reader can check that all this generalizes what we have discussed above in the case \( r = 2 \) and also gives the familiar formulas in the case \( r = 1 \).

**The Alexander-Hirschowitz Theorem**

In this general form, the problem of computing the dimension of \( L^{(r)}_d(\sum_{i=1}^{n} m_p p_i) \) for \( n \) general points \( p_i \) is unsolved; there is not even a precise conjecture about which of these systems should be "special", in the sense of having dimension higher than expected. However, the analogue of the Multiplicity One Theorem is still true, with practically the same proof.

The only other statement known in higher dimension involves the multiplicity two case, which was settled by J. Alexander and A. Hirschowitz about 1988. Here the number of conditions imposed by a point of multiplicity at least two is \( r+1 \), so that the expected dimension is

\[
\max\{-1, \binom{r+d}{d} - 1 - n(r+1)\}.
\]

For a hypersurface to have multiplicity at least two at a point is equivalent to saying that it is singular at the point.

**Alexander-Hirschowitz Theorem.** Fix \( r \geq 2 \) and \( d \geq 2 \), and consider the linear system \( L = L_d^{(r)}(\sum_{i=1}^{n} 2p_i) \) consisting of hypersurfaces of degree at least \( d \) in \( r \) variables that are singular at \( n \) general points \( \{p_i\} \).

(a) For \( d = 2 \), the linear system \( L \) is special if and only if \( 2 \leq n \leq r \).

(b) For \( d \geq 3 \), the linear system \( L \) is special if and only if the triple \( (r, d, n) \) is one of the following: \( (2, 4, 5), (3, 4, 9), (4, 4, 14), (4, 3, 7) \).

Most of these special systems are rather easily understood. First, let us take up the case of the quadrics, where \( d = 2 \). Any quadric hypersurface is defined by a quadratic polynomial, which, if we homogenize, can be considered as a quadratic form in \( r + 1 \) variables. This in turn can be considered as a symmetric square matrix \( Q \) of size \( r+1 \). We can choose coordinates so that the first \( r+1 \) of the points (if there are that many) occur at the "coordinate points" whose homogeneous coordinates correspond to the standard basis vectors; these are the points \([1:0:0: \cdots:0],[0:1:0: \cdots:0], \ldots \) For the quadric hypersurface to have multiplicity at least two at \([1:0:0: \cdots:0]\), the first row (and column) of the matrix \( Q \) must be zero. This is clearly \( r+1 \) linear conditions, as it should be. However, for
the quadric to have multiplicity at least two at the second point \([0 : 1 : 0 : \cdots : 0]\), the second row and column of \(Q\) must be zero. If the first row and column are already zero, the first entry of the second row and column are automatically zero, so there are only \(r\) additional entries that must be zero. Hence the second point imposes only \(r\) conditions, not \(r + 1\), and the actual dimension is one larger than expected. This phenomenon continues until there are \(r + 1\) points, in which case the matrix \(Q\) is all zero, and there are no nontrivial quadratic polynomials satisfying the condition: \(L\) is empty and its actual dimension is \(-1\), which is at this point quite expected.

We saw this example in the plane as the special system \(L_2(-2p - 2q)\) of conics double at two points; this exists (as the double line) but is unexpected. Here \(d = n = r = 2\).

For the special systems with \(d = 4\), the philosophy is quite similar to that of the \((-1)\)-curves in the plane: in every case the system is expected to be empty, but in fact a double quadric exists. To see the numerology of it all, first note that the space of quadrics in \(r\)-space has projective dimension \(r(r + 3)/2\). Let this be \(n\), so that there exists a unique quadric passing through the \(n\) points. Then the double quadric will be a quartic with multiplicity two at the \(n\) points. For this to be unexpected, we want \(n \leq -1\), or

\[
\left(\frac{r + 4}{4}\right) - 1 - (r(r + 3)/2)(r + 1) \leq -1,
\]

which happens exactly for \(r = 2, 3, 4\). This explains the first three cases of (b) in the theorem.

The fourth one, the linear systems of cubics in 4-space with multiplicity at least 2 at seven general points, is a different animal altogether. Again the system is expected to be empty. However, there is a cubic with a fascinating construction in the system.

A rational normal curve in \(r\)-space is a curve that has, after a possible linear change of coordinates, the parametric description

\[
t \rightarrow (t, t^2, t^3, \ldots, t^r).
\]

These curves have a long history and enjoy many properties, causing them to attract more than their share of attention. For example, they have the smallest possible degree (namely \(r\)) among all curves spanning \(r\)-space. It is an exercise in linear algebra that through \(r + 3\) general points of \(r\)-space there passes a rational normal curve; in particular, through our seven general points of 4-space there passes a rational normal curve \(C\). Let \(X\) be the union of all secant lines to \(C\); since \(C\) is a curve and a point of a secant line is determined by choosing a first point \(x\) on \(C\), choosing a second point \(y\) of \(C\), and then choosing a third point on the line \(xy\), we see that \(X\) is a 3-dimensional object in 4-space. It therefore is defined by the vanishing of a single equation \(F\), which is in fact of degree 3: there are exactly three secants to \(C\) meeting a general line of 4-space.

This cubic hypersurface \(X\) is the unexpected member of the linear system \(L_3(-\sum p_i)\). It clearly passes through the original seven points, since \(C\) does; therefore the multiplicity is at least one. If it were only one, say at \(p_1\), then \(X\) would be smooth at \(p_1\), not singular. Therefore \(X\) would have a tangent space at \(p_1\), which would necessarily have dimension 3 and would contain every secant line of \(X\) which contained \(p_1\). But since \(C\) spans the 4-space, there are secant lines to \(C\) through \(p_1\) in four independent directions! This contradiction shows that \(X\) is singular all along \(C\) in fact, and in particular at the original seven points.

The reader who is interested in learning a bit more about rational normal curves may consult [Har].

The Waring Problem

The Waring problem for integers is the following: Given an integer \(N\), write it as a sum of \(d^{th}\) powers. Of course, one can always do this by using 1\(^d\) \(N\) times, but the problem begins to have some meat to it when one asks how many \(d^{th}\) powers are necessary. For example, the famous Four Squares Theorem says that every positive integer can be written as a sum of four squares; this is sharp, since, for example, 7 is not a sum of three squares.

The Waring problem generalizes to polynomials as follows: Given a homogeneous polynomial ("form") \(F\) of degree \(d\), write \(F\) as a sum of \(d^{th}\) powers of linear forms:

\[
F = \sum_i L_i^d.
\]

How many powers are necessary for a given \(F\)? For every \(F\)? For the general \(F\)?

It turns out that there is a surprising relationship between Waring's problem for forms and the Alexander-Hirschowitz Theorem on the dimension of linear systems of hypersurfaces with imposed singularities. This relationship exploits the duality between polynomials and partial differential operators.

Since we are discussing forms, it is convenient to work projectively. So fix homogeneous coordinates \([z_0 : z_1 : \cdots : z_r]\) in \(\mathbb{P}^r\). Define dual variables \(x_0, \ldots, x_r\) that act on the \(z\)'s as partial derivative operations: \(x_i = \partial/\partial z_i\). In this way the dual polynomial ring \(\mathbb{C}[x_0, \ldots, x_r]\) acts on the original polynomial ring \(\mathbb{C}[z_0, \ldots, z_r]\) so that the homogeneous differential operators in \(z\) of degree \(d\) are perfectly paired with the homogeneous polynomials in \(z\) of degree \(d\).

Now fix \(n\) points \(p_1, \ldots, p_n\) in \(\mathbb{P}^r\) and a degree \(d\). There are two constructions we can make with these \(n\) points. First, we can take the vector space of forms in the \(z\)'s of degree \(d\) that are singular at the \(p_i\)'s; this is the vector space associated to
the space \( L_d^{(r)}(- \Sigma i 2p_i) \) discussed above and is the subject of the Alexander-Hirschowitz Theorem.

Second, to any point \( q = [q_0 : \cdots : q_r] \in \mathbb{P}^r \) we can associate the linear differential operator \( \Delta = \Sigma i q_i x_i \), which is well defined up to constant factor. In particular, to a set of \( n \) points \( \{p_i\} \) in \( \mathbb{P}^r \) we obtain a set of \( n \) linear differential operators \( \Delta_1, \ldots, \Delta_n \) in the dual polynomial ring \( \mathbb{C}[x_0, \ldots, x_r] \).

Define
\[
A_d^{(r)}(\Sigma i p_i) = \{ \Sigma i M_i(x) A_d^{d-1} \mid \deg(M_i) = 1 \};
\]

note this is a subspace of the space of differential operators of degree \( d \).

Recall that the differential operators in \( x \) of degree \( d \) are perfectly paired with the polynomials in \( z \) of degree \( d \). In fact, under this pairing, the two spaces \( L_d^{(r)}(- \Sigma i 2p_i) \) and \( A_d^{(r)}(\Sigma i p_i) \) exactly annihilate each other; this is Terracini's Lemma, dating back to 1915 or so.

The proof is not even too hard, once one organizes things and uses all of the algebraic tools at hand. The only real computation to make is to check that it is true for one point, say \( p_1 = [1 : 0 : \cdots : 0] \). Then \( \Delta_1 = x_0 \), so \( A_d^{(r)}(p_1) \) is spanned by the monomials \( x_i x_0^{d-1} \mid 0 \leq i \leq r \).

Now \( L_d^{(r)}(-2p_1) \) is the space of polynomials of degree \( d \) that are singular at \( p_1 \), and this implies that such a polynomial cannot contain the monomial \( z_0^d \) (else it would not even vanish at \( p_1 \)) nor any of the monomials \( z_i z_0^{d-1} \) (else it would have multiplicity one at \( p_1 \)).

Visibly these two spaces are dual to each other. This proves the statement for this one special point; it follows for any point by noticing that the duality is equivariant under linear transformations and any two points of \( \mathbb{P}^r \) are in the same orbit of \( \text{GL}(r+1) \).

Now the statement for more than one point follows from the perfection of the pairing if one uses the equalities \( A_d^{(r)}(\Sigma i p_i) = \Sigma i A_d^{(r)}(p_i) \) and \( L_d^{(r)}(- \Sigma i 2p_i) = \cap_i L_d^{(r)}(-2p_i) \).

The purpose of noticing this duality is to arrive at a determination of the dimension of \( A_d^{(r)}(\Sigma i p_i) \):

**Corollary.** Fix general points \( \{p_i\} \). Then
\[
\dim A_d^{(r)}(\Sigma i p_i) = (d+r) \cdot n - \dim L_d^{(r)}(- \Sigma i 2p_i).
\]

If \( d \geq 3 \), then
\[
\dim A_d^{(r)}(\Sigma i p_i) = \min \left\{ m(n+1), \left( \frac{d+r}{r} \right) \right\}
\]

unless \( (r, d, n) \) is one of the four triples \((2, 4, 5), (3, 4, 9), (4, 4, 14), (4, 3, 7)\), in which case it is one less.

The first statement is simply an application of the duality, and the second uses the Alexander-Hirschowitz Theorem to identify the “unexpected” situations.

Now comes the connection to the Waring problem. Let \( W \) be the manifold of all forms of degree \( d \) in the \( x_i \)'s that can be written as a sum of \( n d^{th} \) powers of linear forms. Fixing the points \( p_i \) as above and the corresponding linear forms \( \Delta_i \), we have that
\[
A_d^{(r)}(\Sigma i p_i) \text{ is the tangent space to } W \text{ at the point } w = \Sigma i \Delta_i.
\]

This is a simple calculation: the tangent space is given by the first-order terms of the variation
\[
\sum (\Delta_i + M_i d) = \sum i \Delta_i d + \sum d M_i \Delta_i d^{-1} + \ldots,
\]

which from the above expansion we see is exactly \( A_d^{(r)}(\Sigma i p_i) \).

At the general point of \( W \), the dimension of the tangent space is equal to the dimension of \( W \). If we want the general form to be written as a sum of \( n d^{th} \) powers, we need \( W \) to be the entire space of all forms of degree \( d \), which is equivalent to having \( \dim(W) = (d+1)^r \). Using the above computation, we then need \( n(r+1) \geq (d+1)^r \), unless we are in one of the exceptional cases. This leads to the following.

**Waring Problem for General Forms**

Fix \( d \geq 3 \). Then the minimum \( n \) such that the general form of degree \( d \) in \( r+1 \) variables can be written as a sum of \( n d^{th} \) powers is \( \lceil \frac{d+1}{d} \rceil \), unless \( (r, d) \) is equal to \((2, 4), (3, 4), (4, 4), \) or \((4, 3)\), where it requires one more \( d^{th} \) power.

The exceptions were known in the last century; Clebsch, Reye, and Sylvester among others had noted them. For the experts, the manifold \( W \) introduced above is the "\( n \)-secant variety to the \( d \)-fold Veronese". Thinking in these terms, Lazarsfeld, Mukai, and others realized the connection between Alexander-Hirschowitz and Waring. The approach above is that taken by J. Emsalem and A. Iarrobino [1].

**Recent Work on the Main Conjecture**

The Main Conjecture concerning the dimensions of the linear systems of curves in the plane with general multiple base points, i.e., the spaces \( L_d(- \Sigma i m p_i) \), is still open. Recent work has focused on the special case where all of the multiplicities are equal, say to \( m \); this is the system
February 1999

NOTICES OF THE AMS

\( \mathcal{L}_d( - \sum_{i=1}^{n} m \mathcal{P}_i ) \) of curves of degree \( d \) having multiplicity \( m \) at \( n \) general points. The \( m = 2 \) case has been treated by B. Segre, by E. Arbarello and M. Cornalba, and by A. Hirschowitz, and is now settled. Hirschowitz also handled the \( m = 3 \) case in 1985. The \( m = 4 \) case has recently been addressed by L. Eskin and by T. Mignon (who also treats the general case with all \( m_i \leq 4 \)). The Main Conjecture is also true in all of these cases.

In the last ten years there has been a flurry of activity in the area, by those mentioned above, and by L. Caporaso, J. Harris, A. Geramita, A. Gimigliano, Y. Pitteloud, and G. Xu; some of this builds on work of M. Nagata.

Recently the author, in joint work with C. Ciliberto of the University of Rome II, has been investigating a degeneration technique that applies to the problem at hand. The main idea is the following. We are studying systems of curves in the plane \( \mathbb{P}^2 \), with multiplicity at least \( m \) at \( n \) general points.

If we put the points in special position, the dimension of the space can only rise, by semicontinuity. On the other hand, the special position of the points may allow us to compute the dimension more easily. If we are able to find a special position for the points such that the resulting system has the expected dimension, then it will certainly have the expected dimension for general positions of the points.

This "degeneration" approach, namely, to degenerate the positions of the points, is fundamentally the approach of the previous authors, in one form or another. The problem is that the computation of the dimension for the case when the points are in special position is, by its very nature, a somewhat special computation, and therefore it is difficult to arrange the analysis to take advantage of any possible recursions that may present themselves.

Ciliberto and the author have studied the possibility of degenerating the entire plane itself to two surfaces, each of which is more or less a plane. The corresponding degeneration in one dimension can be described as follows. Take the line with affine coordinate \( t \). Embed the line in the plane using the coordinatization of the rational normal curve of degree 2: \( t \rightarrow (t, t^2) \). This realizes the line as a conic (a parabola, in fact) in the \( (x, y) \) plane, given by \( y = x^2 \). Now degenerate the conic to two lines by introducing a degeneration parameter \( u \) and considering \( (1 - u^2) y^2 + u y = x^2 \). For \( u = 1 \) we have the original parabola; for \( u \) near zero but not zero, we have hyperbolas; for \( u = 0 \) we have the two lines \( y = \pm x \).

This trick, of degenerating one line to two, can be executed with the plane also using similar methods. One re-embeds the plane into 5-space (by sending \( (x, y) \) to \( (x, y, x^2, xy, y^2) \); the result is a quartic surface, which then degenerates to a union of two surfaces, one a plane and one a cubic surface that is itself a re-embedded plane. This has the effect of degenerating the plane into two planes. A degeneration of this type was first exploited by Z. Ran for enumerative purposes in [R].

One now studies the degeneration of the plane curves, passing through \( n \) general points with multiplicity at least \( m \). The advantage of this approach is that the \( n \) points also degenerate to points on the two surfaces, and one can arrange to degenerate \( a \) of the points on the one plane and \( b = n - a \) of the points on the other plane. The plane curves then degenerate to plane curves of known degree having multiplicity at least \( m \) at \( a \) points (respectively \( b \) points) in the limit. The reader can now appreciate the possibility of a recursion being performed, which is in fact what we are able to execute in many cases.

The story gets technical rather quickly, but the bottom line is that using this method we have been able to verify that the Main Conjecture is true whenever the multiplicities are all constant and at most 12; these results are described in [CM1] and [CM2]. Unfortunately, we have found examples of parameters \( d, m, \) and \( n \) for which not one of these degenerations works, in the sense that the dimension of the limit system is always greater than the expected dimension; hence no conclusion can be drawn from the semicontinuity argument. So more thought is required!

I hope that I have piqued the reader's interest in some of these questions and given a small glimpse into the theoretical world of polynomial interpolation and its ramifications. In summary, here is a great classical problem, easily stated and understood, which is stubbornly resisting attempts to finish it off.

Acknowledgments
This article grew out of two sets of lectures given by the author in 1997, one at the University of Rome II in June and the other at the University of Bayreuth in October. I wish to thank C. Ciliberto and C. DeConcini for their hospitality in Rome and T. Peternell and F. Schreyer for theirs in Bayreuth. I especially want to acknowledge Michael Schneider, who invited and encouraged me to give the summer school lectures in Bayreuth and who tragically passed away before I had a chance to see him there. He is greatly missed by a host of colleagues around the globe who benefited from his energy, enthusiasm, expertise, and excitement for mathematics and for life.

The Mathematics of Ciphers: Number Theory and RSA Cryptography
S. C. Coutinho
hardcover; 198 pp.; $30.00

What do prime numbers, multiplication, and factoring have in common? They are all part of The Mathematics of Ciphers, code-building at its best.

Revised and updated since its publication in Portuguese in 1997, this highly accessible book is an introduction to the algorithmic aspects of number theory and its applications to cryptography. Accompanied by historical anecdotes, the familiar topics of number theory are defined and explored. The author takes the reader on a leisurely journey through this fascinating field, culminating in a visit to the RSA cryptosystem.

...AND THEN

The Queen of Mathematics:
A Historically Motivated Guide to Number Theory
Jay Goldman
hardcover; 525 pp.; $59.95

"The title of the book derives from Gauss’ famous assertion that number theory is ‘the queen of mathematics.’ As one of those who fervently believes Gauss’ dictum, once I began to read Goldman’s book, I had difficulty putting it aside and consequently went to bed later than I should have for two successive nights... There are few mathematics books that are more enjoyable and inspiring than this one. The Queen of Mathematics should be in the library at any college or university where mathematics is taught."

Twenty Years of Attacks on the RSA Cryptosystem

Dan Boneh

Introduction
The RSA cryptosystem, invented by Ron Rivest, Adi Shamir, and Len Adleman [18], was first publicized in the August 1977 issue of Scientific American. The cryptosystem is most commonly used for providing privacy and ensuring authenticity of digital data. These days RSA is deployed in many commercial systems. It is used by Web servers and browsers to secure Web traffic, it is used to ensure privacy and authenticity of e-mail, it is used to secure remote login sessions, and it is at the heart of electronic credit card payment systems. In short, RSA is frequently used in applications where security of digital data is a concern.

Since its initial publication, the RSA system has been analyzed for vulnerability by many researchers. Although twenty years of research have led to a number of fascinating attacks, none of them is devastating. They mostly illustrate the dangers of improper use of RSA. Indeed, securely implementing RSA is a nontrivial task.

Our goal is to survey some of these attacks and describe the underlying mathematical tools they use. Throughout the survey we follow standard naming conventions and use "Alice" and "Bob" to denote two generic parties wishing to communicate with each other. We use "Marvin" to denote a malicious attacker wishing to eavesdrop or tamper with the communication between Alice and Bob.

We begin by describing a simplified version of RSA encryption. Let \( N = pq \) be the product of two large primes of the same size \((n/2)\text{ bits each}\). A typical size for \( N \) is \( n = 1024 \text{ bits} \), i.e., 309 decimal digits. Each of the factors is 512 bits. Let \( e, d \) be two integers satisfying \( ed = 1 \mod \varphi(N) \) where \( \varphi(N) = (p - 1)(q - 1) \) is the order of the multiplicative group \( Z^*_N \). We call \( N \) the RSA modulus, \( e \) the encryption exponent, and \( d \) the decryption exponent. The pair \( (N, e) \) is the public key. As its name suggests, it is public and is used to encrypt messages. The pair \( (N, d) \) is called the secret key or private key and is known only to the recipient of encrypted messages. The secret key enables decryption of ciphertexts.

A message is an integer \( M \in Z^*_N \). To encrypt \( M \), one computes \( C = M^e \mod N \). To decrypt the ciphertext, the legitimate receiver computes \( C^d \mod N \). Indeed,

\[
C^d = M^{ed} = M \mod N,
\]

where the last equality follows by Euler's theorem.\(^1\) One defines the RSA function as \( x \rightarrow x^e \mod N \). If \( d \) is given, the function can be easily inverted using the above equality. We refer to \( d \) as a trapdoor enabling one to invert the function. In this survey we study the difficulty of inverting the RSA function without the trapdoor. We refer to this as breaking RSA. More precisely, given the triple \( (N, e, C) \), we ask how hard is it to compute the \( e \text{th} \) root of \( C \) modulo \( N = pq \) when the factorization of \( N \) is unknown. Since \( Z^*_N \) is a finite set, one may enumerate all elements of \( Z^*_N \) until the correct \( M \) is found. Unfortunately, this results in an algorithm with running time of order \( N \),

\[^1\text{Our description slightly oversimplifies RSA encryption. In practice, messages are padded prior to encryption using some randomness [1]. For instance, a simple (but insufficient) padding algorithm may pad a plaintext \( M \) by appending a few random bits to one of the ends prior to encryption. Adding randomness to the encryption process is necessary for proper security.}\]
primality using a probabilistic primality test [16].

The RSA function $x \rightarrow x^e \mod N$ is an example of a trapdoor one-way function. It can be easily computed, but (as far as we know) cannot be efficiently inverted without the trapdoor $d$ except in special circumstances. Trapdoor one-way functions can be used for digital signatures [16]. Digital signatures provide authenticity and nonrepudiation of electronic legal documents. For instance, they are used for signing digital checks or electronic contracts. In special circumstances, Trapdoor one-way functions provide authenticity and nonrepudiation of electronic legal documents. For instance, they are used for signing digital checks or electronic contracts.

**Factoring Large Integers**

The first attack on an RSA public key $(N, e)$ to consider is factoring the modulus $N$. Given the factorization of $N$, an attacker can easily construct $\varphi(N)$, from which the decryption exponent $d = e^{-1} \mod \varphi(N)$ can be found. We refer to factoring the modulus as a brute-force attack on RSA.

In this survey we mainly study the RSA function as opposed to the RSA cryptosystem. Loosely speaking, the difficulty of inverting the RSA function on random inputs implies that given $(N, e, C)$, an attacker cannot recover the plaintext $M$. However, a cryptosystem must resist more subtle attacks. If $(N, e, C)$ is given, it should be intractable to recover any information about $M$. This is known as semantic security. We do not discuss these subtle attacks, but point out that RSA as described above is not semantically secure: given $(N, e, C)$, one can easily deduce some information about the plaintext $M$ (for instance, the Jacobi symbol of $M$ over $N$ can be easily deduced from $C$). RSA can be made semantically secure by adding randomness to the encryption process [1].

The RSA function $x \rightarrow x^e \mod N$ is an example of a trapdoor one-way function. It can be easily computed, but (as far as we know) cannot be efficiently inverted without the trapdoor $d$ except in special circumstances. Trapdoor one-way functions can be used for digital signatures [16]. Digital signatures provide authenticity and nonrepudiation of electronic legal documents. For instance, they are used for signing digital checks or electronic purchase orders. To sign a message $M \in \mathbb{Z}_N^*$ using RSA, Alice applies her private key $(N, d)$ to $M$ and obtains a signature $S = M^d \mod N$. Given $(M, S)$, anyone can verify Alice’s signature on $M$ by checking that $S^e = M \mod N$. Since only Alice can generate $S$, one may suspect that an adversary cannot forge Alice’s signature. Unfortunately, things are not so simple; extra measures are needed for proper security. Digital signatures are an important application of RSA. Some of the attacks we survey specifically target RSA digital signatures.

An RSA key pair is generated by picking two random $\frac{n}{2}$-bit primes and multiplying them to obtain $N$. Then, for a given encryption exponent $e < \varphi(N)$, one computes $d = e^{-1} \mod \varphi(N)$ using the extended Euclidean algorithm. Since the set of primes is sufficiently dense, a random $\frac{n}{2}$-bit prime can be quickly generated by repeatedly picking random $\frac{n}{2}$-bit integers and testing each one for primality using a probabilistic primality test [16].

**Factoring Large Integers**

The first attack on an RSA public key $(N, e)$ to consider is factoring the modulus $N$. Given the factorization of $N$, an attacker can easily construct $\varphi(N)$, from which the decryption exponent $d = e^{-1} \mod \varphi(N)$ can be found. We refer to factoring the modulus as a brute-force attack on RSA.

In this context, “chosen ciphertext attack” refers to an attacker, Marvin, who is given a public key $(N, e)$ and access to a black box that decrypts messages of his choice. Marvin succeeds in mounting the chosen ciphertext attack if by using the black box he can recover the private key $(N, d)$. 

---

2A source that explains semantic security and gives examples of semantically secure ciphers is [9].

---

In other words, small $e$ there may not exist a polynomial-time reduction from factoring to breaking RSA. They do so by showing that in a certain model, a positive answer to the problem for small $e$ yields an efficient factoring algorithm. We note that a positive answer to Problem 1 gives rise to a chosen ciphertext attack on RSA. Therefore, a negative answer may be welcome.

Next we show that exposing the private key $d$ and factoring $N$ are equivalent. Hence there is no

In this context, “chosen ciphertext attack” refers to an attacker, Marvin, who is given a public key $(N, e)$ and access to a black box that decrypts messages of his choice. Marvin succeeds in mounting the chosen ciphertext attack if by using the black box he can recover the private key $(N, d)$. 

---

In other words, small $e$ there may not exist a polynomial-time reduction from factoring to breaking RSA. They do so by showing that in a certain model, a positive answer to the problem for small $e$ yields an efficient factoring algorithm. We note that a positive answer to Problem 1 gives rise to a chosen ciphertext attack on RSA. Therefore, a negative answer may be welcome.

Next we show that exposing the private key $d$ and factoring $N$ are equivalent. Hence there is no
point in hiding the factorization of $N$ from any party who knows $d$.

**Fact 1.** Let $(N, e)$ be an RSA public key. Given the private key $d$, one can efficiently factor the modulus $N = pq$. Conversely, given the factorization of $N$, one can efficiently recover $d$.

**Proof.** A factorization of $N$ yields $\varphi(N)$. Since $e$ is known, one can recover $d$. This proves the converse statement. We now show that given $d$, one can factor $N$. Given $d$, compute $k = de - 1$. By definition of $d$ and $e$ we know that $k$ is a multiple of $\varphi(N)$. Since $\varphi(N)$ is even, $k = 2^r t$ with $t$ odd and $r \geq 1$. We have $g^k = 1$ for every $g \in \mathbb{Z}_N^*$, and therefore $g^{k/2}$ is a square root of unity modulo $N$. By the Chinese Remainder Theorem, 1 has four square roots modulo $N = pq$. Two of these square roots are $\pm x$ where $x$ satisfies $x = 1 \mod p$ and $x = -1 \mod q$. Using either one of these last two square roots, one can reveal the factorization of $N$ by computing $\gcd(x - 1, N)$. A straight-forward argument shows that if $g$ is chosen at random from $\mathbb{Z}_N^*$, then with probability at least $1/2$ (over the choice of $g$) one of the elements in the sequence $g^{k/2}, g^{k/4}, \ldots, g^{k/2^r}$ mod $N$ is a square root of unity that reveals the factorization of $N$. All elements in the sequence can be efficiently computed in time $O(n^2)$ where $n = \log_2 N$.

**Elementary Attacks**

We begin by describing some old elementary attacks. These attacks illustrate blatant misuse of RSA. Although many such attacks exist, we give only two examples.

**Common Modulus**

To avoid generating a different modulus $N = pq$ for each user, one may wish to fix $N$ once and for all. The same $N$ is used by all users. A trusted central authority could provide user $i$ with a unique pair $e_i, d_i$ from which user $i$ forms a public key $(N, e_i)$ and a secret key $(N, d_i)$.

At first glance this may seem to work: a ciphertext $C = M^{e_i} \mod N$ intended for Alice cannot be decrypted by Bob, since Bob does not possess $d_a$. However, this is incorrect, and the resulting system is insecure. By Fact 1 Bob can use his own exponents $e_0, d_0$ to factor the modulus $N$. Once $N$ is factored Bob can recover Alice's private key $d_a$ from her public key $e_d$. This observation, due to Simmons, shows that an RSA modulus should never be used by more than one entity.

**Blinding**

Let $(N, d)$ be Bob's private key and $(N, e)$ his corresponding public key. Suppose Marvin wants Bob's signature on a message $M \in \mathbb{Z}_N^*$. Being no fool, Bob refuses to sign $M$. Marvin can try the following: he picks a random $r \in \mathbb{Z}_N^*$ and sets $M' = r^d M \mod N$. He then asks Bob to sign the random message $M'$. Bob may be willing to provide his signature $S'$ on the innocent-looking $M'$. But recall that $S' = (M')^d \mod N$. Marvin now simply computes $S = S'/r \mod N$ and obtains Bob's signature $S$ on the original $M$. Indeed,

$$S^r = (S')^r / r^e = (M')^{rd} / r^e = M' / r^e = M \mod N.$$  

This technique, called *blinding*, enables Marvin to obtain a valid signature on a message of his choice by asking Bob to sign a random "blinded" message. Bob has no information as to what message he is actually signing. Since most signature schemes apply a "one-way hash" to the message $M$ prior to signing [16], the attack is not a serious concern. Although we presented blinding as an attack, it is actually a useful property of RSA needed for implementing anonymous digital cash (cash that can be used to purchase goods, but does not reveal the identity of the person making the purchase).
Low Private Exponent
To reduce decryption time (or signature-generation time), one may wish to use a small value of $d$ rather than a random $d$. Since modular exponentiation takes time linear in $\log_2 d$, a small $d$ can improve performance by at least a factor of 10 (for a 1024-bit modulus). Unfortunately, a clever attack due to M. Wiener [19] shows that a small $d$ results in a total break of the cryptosystem.

**Theorem 2** (M. Wiener). Let $N = pq$ with $q < p < 2q$. Let $d < \frac{1}{3}N^{1/4}$. Given $(N, e)$ with $ed = 1 \mod \phi(N)$, Marvin can efficiently recover $d$.

**Proof.** The proof is based on approximations using continued fractions. Since $ed = 1 \mod \phi(N)$, there exists a $k$ such that $ed - k\phi(N) = 1$. Therefore,

$$\left| \frac{e}{\phi(N)} - \frac{k}{d} \right| = \frac{1}{d\phi(N)}.$$  

Hence, $\frac{k}{d}$ is an approximation of $\frac{e}{\phi(N)}$. Although Marvin does not know $\phi(N)$, he may use $N$ to approximate it. Indeed, since $\phi(N) = N - p - q + 1$ and $p + q - 1 < 3\sqrt{N}$, we have $|N - \phi(N)| < 3\sqrt{N}$. Using $N$ in place of $\phi(N)$, we obtain:

$$\left| \frac{e}{N} - \frac{k}{d} \right| = \left| \frac{ed - k\phi(N) - kN + k\phi(N)}{Nd} \right| = \left| \frac{1 - k(N - \phi(N))}{Nd} \right| \leq \frac{3k}{\sqrt{N}}.$$

Now, $k\phi(N) = ed - 1 < ed$. Since $e < \phi(N)$, we see that $k < d < \frac{1}{3}N^{1/4}$. Hence we obtain:

$$\left| \frac{e}{N} - \frac{k}{d} \right| \leq \frac{1}{\sqrt{N}} < \frac{1}{2d^2}.$$  

This is a classic approximation relation. The number of fractions $\frac{k}{d}$ with $d < N$ approximating $\frac{e}{N}$ so closely is bounded by $\log_2 N$. In fact, all such fractions are obtained as convergents of the continued fraction expansion of $\frac{e}{N}$ [10, Th. 177]. All one has to do is compute the log $N$ convergents of the continued fraction for $\frac{e}{N}$. One of these will equal $\frac{k}{d}$. Since $ed - k\phi(N) = 1$, we have $\gcd(k, d) = 1$, and hence $\frac{k}{d}$ is a reduced fraction. This is a linear-time algorithm for recovering the secret key $d$. □

Low Public Exponent
To reduce encryption or signature-verification time, it is customary to use a small public exponent $e$. The smallest possible value for $e$ is 3, but to defeat certain attacks the value $e = 2^{16} + 1 = 65537$ is recommended. When the value $2^{16} + 1$ is used, signature verification requires 17 multiplications, as opposed to roughly 1,000 when a random $e < \phi(N)$ is used. Unlike the attack of the previous section, attacks that apply when a small $e$ is used are far from a total break.

Coppersmith's Theorem
The most powerful attacks on low public exponent RSA are based on a theorem due to Coppersmith [7]. Coppersmith's theorem has many applications, only some of which will be covered here. The proof uses the LLL lattice basis reduction algorithm [15], as explained below.
Theorem 3 (Coppersmith). Let $N$ be an integer and $f \in \mathbb{Z}[x]$ be a monic polynomial of degree $d$. Set $X = N^{1/d}$ for some $\epsilon \geq 0$. Then, given $(N, f)$, Marvin can efficiently find all integers $|x_0| < X$ satisfying $f(x_0) \equiv 0 \pmod{N}$. The running time is dominated by the time it takes to run the LLL algorithm on a lattice of dimension $O(w)$ with $w = \min(1/\epsilon, \log_2 N)$.

The theorem provides an algorithm for efficiently finding all roots of $f$ modulo $N$ that are less than $X = N^{1/d}$. As $X$ gets smaller, the algorithm's running time decreases. The theorem's strength is its ability to find small roots of polynomials modulo a composite $N$. When working modulo a prime, there is no reason to use Coppersmith's theorem, since other, far better root-finding algorithms exist.

We sketch the main ideas behind the proof of Coppersmith's theorem. We follow a simplified approach due to Howgrave-Graham [12]. Given a polynomial $h(x) = \sum a_i x^i \in \mathbb{Z}[x]$, define $\|h\|^2 = \sum |a_i|^2$. The proof relies on the following observation.

**Lemma 4.** Let $h(x) \in \mathbb{Z}[x]$ be a polynomial of degree $d$, and let $X$ be a positive integer. Suppose $\|h(x)\| < N^{1/d}$. If $|x_0| < X$ satisfies $h(x_0) \equiv 0 \pmod{N}$, then $h(x_0) = 0$ holds over the integers.

**Proof.** Observe from the Schwarz inequality that

$$
|h(x_0)| \leq \sum |a_i x_0^i| = \sum |a_i X^i (X_0^i)| \leq \sum |a_i X^i| \leq \sqrt{d} \|h(x)\| < N.
$$

Since $h(x_0) = 0 \pmod{N}$, we conclude that $h(x_0) = 0$. \qed

The lemma states that if $h$ is a polynomial with low norm, then all small roots of $h$ mod $N$ are also roots of $h$ over the integers. The lemma suggests that to find a small root $x_0$ of $f(x) \pmod{N}$, we should look for another polynomial $h \in \mathbb{Z}[x]$ with small norm having the same roots as $f$ modulo $N$. Then $x_0$ will be a root of $h$ over the integers and can be easily found. To do so, we may search for a polynomial $g \in \mathbb{Z}[x]$ such that $h \equiv g f$ has low norm, i.e., norm less than $N$. This amounts to searching for an integer linear combination of the polynomials $f, xf, x^2 f, \ldots, x^d f$ with low norm. Unfortunately, most often there is no nontrivial linear combination with sufficiently small norm.

Coppersmith found a trick to solve the problem: if $f(x_0) \equiv 0 \pmod{N}$, then $f(x_0)^k \equiv 0 \pmod{N^k}$ for any $k$. More generally, define the following polynomials:

$$
g_{u,v}(x) = N^{m-v} x^u f(x)^v
$$

for some predefined $m$. Then $x_0$ is a root of $g_{u,v}(x)$ modulo $N^m$ for any $u \geq 0$ and $0 \leq v \leq m$. To use Lemma 4 we must find an integer linear combination $h(x)$ of the polynomials $g_{u,v}(x)$ such that $h(x)$ has norm less than $N^m$ (recall that $X$ is an upper bound on $x_0$ satisfying $X \leq N^{1/d}$). Thanks to the relaxed upper bound on the norm ($N^m$ rather than $N$), one can show that for sufficiently large $m$ there always exists a linear combination $h(x)$ satisfying the required bound. Once $h(x)$ is found, Lemma 4 implies that it has $x_0$ as a root over the integers. Consequently $x_0$ can be easily found.

It remains to show how to find $h(x)$ efficiently. To do so, we must first state a few basic facts about lattices in $\mathbb{Z}^w$. We refer to [15] for a concise introduction to the topic. Let $u_1, \ldots, u_w \in \mathbb{Z}^w$ be linearly independent vectors. A (full-rank) lattice $L$ spanned by $(u_1, \ldots, u_w)$ is the set of all integer linear combinations of $u_1, \ldots, u_w$. The determinant of $L$ is defined as the determinant of the $w \times w$ square matrix whose rows are the vectors $u_1, \ldots, u_w$.

In our case, we view the polynomials $g_{u,v}(x)$ as vectors and study the lattice $L$ spanned by them. We let $v = 0, \ldots, m$ and $u = 0, \ldots, d - 1$, and hence the lattice has dimension $w = d(m + 1)$. For example, when $f$ is a quadratic monic polynomial and $m = 3$, the resulting lattice is spanned by the rows of the following matrix:

$$
\begin{bmatrix}
1 & x & x^2 & x^3 & x^4 & x^5 & x^6 & x^7 \\
1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
1 & 0 & 0 & x & 0 & x^2 & 0 & x^3 \\
1 & 0 & x & 0 & 0 & 0 & 0 & 0 \\
1 & x & 0 & 0 & 0 & 0 & 0 & 0 \\
1 & 0 & 0 & x & 0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 & x & 0 & 0 & 0 \\
1 & 0 & x^2 & 0 & 0 & 0 & 0 & 0 \\
1 & x^3 & 0 & 0 & 0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 & x & 0 & 0 & 0 \\
1 & 0 & 0 & 0 & 0 & x & 0 & 0 \\
1 & 0 & 0 & 0 & 0 & 0 & x & 0 \\
1 & 0 & 0 & 0 & 0 & 0 & 0 & x
\end{bmatrix}
$$

The entries * correspond to coefficients of the polynomials whose value we ignore. All empty entries are zero. Since the matrix is triangular, its determinant is the product of the elements on the diagonal (which are explicitly given above). Our objective is to find short vectors in this lattice.

A classic result of Hermite states that any lattice $L$ of dimension $w$ contains a nonzero point $v \in L$ whose $L_2$ norm satisfies $\|v\| \leq \gamma_w \det(L)^{1/w}$, where $\gamma_w$ is a constant depending only on $w$. Hermite's bound can be used to show that for large enough $m$ our lattice contains vectors of norm less than $N^m$, as required. The question is whether we can efficiently construct a short vector in $L$ whose length is not much larger than the Hermite bound. The LLL algorithm is an efficient algorithm that does precisely that.

**Fact 5** (LLL). Let $L$ be a lattice spanned by $(u_1, \ldots, u_w)$. When $(u_1, \ldots, u_w)$ are given as
input, then the LLL algorithm outputs a point \( \mathbf{v} \in L \) satisfying

\[
\|\mathbf{v}\| \leq 2^{w/4} \det(L)^{1/w}.
\]

The running time for LLL is quartic in the length of the input.

The LLL algorithm (named after its inventors L. Lovasz, A. Lenstra, and H. Lenstra Jr.) has many applications in both computational number theory and cryptography. Its discovery in 1982 provided an efficient algorithm for factoring polynomials over the integers and, more generally, over number rings. LLL is frequently used to attack various cryptosystems. For instance, many cryptosystems based on the “knapsack problem” have been broken using LLL.

Using LLL, we can complete the proof of Coppersmith's theorem. To ensure that the vector produced by LLL satisfies the bound of Lemma 4, we need

\[
2^{w/4} \det(L)^{1/w} < N^{m/\sqrt{w}},
\]

where \( w = d(m + 1) \) is the dimension of \( L \). A routine calculation shows that for large enough \( m \) the bound is satisfied. Indeed, when \( X = N^{3-d} \), it suffices to take \( m = O(k/d) \) with \( k = \min\{\frac{1}{e}, \log N\} \). Consequently, the running time is dominated by running LLL on a lattice of dimension \( O(k) \), as required.

A natural question is whether Coppersmith's theorem can be applied to bivariate and multivariate polynomials. If \( f(x, y) \in \mathbb{Z}[x, y] \) is given for which there exists a root \( (x_0, y_0) \) with \( |x_0y_0| \) suitably bounded, can Marvin efficiently find \( (x_0, y_0) \)? Although the same technique appears to work for some bivariate polynomials, it is currently an open problem to prove it. As an increasing number of results depend on a bivariate extension of Coppersmith's theorem, a rigorous algorithm will be very useful.

**Open Problem 3.** Find general conditions under which Coppersmith's theorem can be generalized to bivariate polynomials.

**Hastad's Broadcast Attack**

As a first application of Coppersmith's theorem, we present an improvement to an old attack due to Hastad [11]. Suppose Bob wishes to send an encrypted message \( M \) to a number of parties \( P_1, P_2, \ldots, P_k \). Each party has its own RSA key \( (N_i, e_i) \). We assume \( M \) is less than all the \( N_i \)'s. Naively, to send \( M \), Bob encrypts it using each of the public keys and sends out the \( i \)th ciphertext to \( P_i \). Marvin can eavesdrop on the connection out of Bob's sight and collect the \( k \) transmitted ciphertexts.

For simplicity, suppose all public exponents \( e_i \) are equal to 3. A simple argument shows that Marvin can recover \( M \) if \( k \geq 3 \). Indeed, Marvin obtains \( C_1, C_2, C_3 \), where

\[
C_1 = M^3 \mod N_1, \quad C_2 = M^3 \mod N_2, \quad C_3 = M^3 \mod N_3.
\]

We may assume that \( \gcd(N_i, N_j) = 1 \) for all \( i \neq j \), since otherwise Marvin can factor some of the \( N_i \)'s. Hence, applying the Chinese Remainder Theorem (CRT) to \( C_1, C_2, C_3 \) gives a \( C' \in \mathbb{Z}_{N_1N_2N_3} \) satisfying \( C' = M^3 \mod N_1N_2N_3 \). Since \( M \) is less than all the \( N_i \)'s, we have \( M^3 < N_1N_2N_3 \). Then \( C' = M^3 \) holds over the integers. Thus, Marvin may recover \( M \) by computing the real cube root of \( C' \). More generally, if all public exponents are equal to \( e \), Marvin can recover \( M \) as soon as \( k \geq e \). The attack is feasible only when a small \( e \) is used.

Hastad [11] describes a far stronger attack. To motivate Hastad's result, consider a naive defense against the above attack. Rather than broadcasting the encryption of \( M \), Bob could "pad" the message prior to encryption. For instance, if \( M \) is \( m \) bits long, Bob could send \( M_i = 12^m + M \) to party \( P_i \). Since Marvin obtains encryptions of different messages, he cannot mount the attack. Unfortunately, Hastad showed that this linear padding is insecure. In fact, he proved that applying any fixed polynomial to the message prior to encryption does not prevent the attack.

Suppose that for each of the participants \( P_1, \ldots, P_k \), Bob has a fixed public polynomial \( f_i \in \mathbb{Z}[x] \). To broadcast a message \( M \), Bob sends the encryption of \( f_i(M) \) to party \( P_i \). By eavesdropping, Marvin learns \( C_i = f_i(M) \mod N_i \) for \( i = 1, \ldots, k \). Hastad showed that if enough parties are involved, Marvin can recover the plaintext \( M \) from all the ciphertexts. The following theorem is a stronger version of Hastad's original result.

**Theorem 6** (Hastad). Let \( N_1, \ldots, N_k \) be pairwise relatively prime integers, and set \( N_{\min} = \min(N_i) \). Let \( g_i \in \mathbb{Z}[x] \) be \( k \) polynomials of maximum degree \( d \). Suppose there exists a unique \( M < N_{\min} \) satisfying

\[
g_i(M) = 0 \mod N_i \quad \text{for all } i = 1, \ldots, k.
\]

Under the assumption that \( k > d \), one can efficiently find \( M \) given \( \langle N_i, g_i \rangle_{i=1}^k \).

**Proof.** Let \( \mathcal{N} = N_1 \cdot \cdots \cdot N_k \). We may assume that all \( g_i \)'s are monic. (Indeed, if for some \( i \) the leading coefficient of \( g_i \) is not invertible in \( \mathbb{Z}_{N_i} \), then the factorization of \( N_i \) is exposed.) By multiplying each \( g_i \) by the appropriate power of \( x \), we may assume they all have degree \( d \). Construct the polynomial

\[
g(x) = \sum_{i=1}^k T_i g_i(x),
\]

where \( T_i = \begin{cases} 1 \mod N_j & \text{if } i = j \\ 0 \mod N_j & \text{if } i \neq j \end{cases} \).
The $T_i$'s are integers known as the Chinese Remainder Coefficients. Then $g(x)$ must be monic, since it is monic modulo all the $N_i$, its degree is $d$. Furthermore, we know that $g(M) = 0 \mod N$. Theorem 6 now follows from Theorem 3, since $M < N_{\text{min}} \leq N^{1/k} < N^{1/d}$.

The theorem shows that a system of univariate equations modulo relatively prime polynomials can be efficiently solved, assuming sufficiently many equations are provided. By setting $g_i = f_i - C_i \mod N_i$, we see that Marvin can recover $M$ from the given ciphertexts whenever the number of parties is at least $d$, where $d$ is the maximum of $e_i \cdot \deg(f_i)$ over all $i = 1, \ldots, k$. In particular, if all $e_i$'s are equal to $e$ and Bob sends out linearly related messages, then Marvin can recover the plaintext as soon as $k > e$.

Hastad's original theorem is weaker than the one stated above. Rather than $d$ polynomials, Hastad required $d(d + 1)/2$ polynomials. Hastad's proof is similar to the proof of Coppersmith's theorem described in the previous section. However, Hastad does not use powers of $g$ in the lattice and consequently obtains a weaker bound.

To conclude this section, we note that to properly defend against the broadcast attack above, one must use a randomized pad [1] rather than a fixed one.

Franklin-Reiter Related Message Attack
Franklin and Reiter [8] found a clever attack when Bob sends Alice related encrypted messages using the same modulus. Let $(N, e)$ be Alice's public key. Suppose $M_1, M_2 \in \mathbb{Z}_N^*$ are two distinct messages satisfying $M_1 = f(M_2) \mod N$ for some publicly known polynomial $f \in \mathbb{Z}_N[x]$. To send $M_1$ and $M_2$ to Alice, Bob may naively encrypt the messages and transmit the resulting ciphertexts $C_1, C_2$. We show that given $C_1, C_2$, Marvin can easily recover $M_1, M_2$. Although the attack works for any small $e$, we state the following lemma for $e = 3$ in order to simplify the proof.

Lemma 7 (FR). Set $e = 3$, and let $(N, e)$ be an RSA public key. Let $M_1 \neq M_2 \in \mathbb{Z}_N^*$ satisfy $M_1 = f(M_2) \mod N$ for some polynomial $f \in \mathbb{Z}_N[x]$ with $b \neq 0$. Then, given $(N, e, C_1, C_2, f)$, Marvin can recover $M_1, M_2$ in time quadratic in $\log N$.

Proof. To keep this part of the proof general, we state it using an arbitrary $e$ (rather than restricting to $e = 3$). Since $C_1 = M_1^e \mod N$, we know that $M_2$ is a root of the polynomial $g_1(x) = f(x)^e - C_1 \in \mathbb{Z}_N[x]$. Similarly, $M_2$ is a root of $g_2(x) = x^e - C_2 \in \mathbb{Z}_N[x]$. The linear factor $x - M_2$ divides both polynomials. Therefore, Marvin may use the Euclidean algorithm\footnote{Although $\mathbb{Z}_N[x]$ is not a Euclidean ring, the standard Euclidean algorithm can still be applied to polynomials in $\mathbb{Z}_N[x]$. One can show that if the algorithm "breaks" in any way, then the factorization of $N$ is exposed.} to compute the gcd of $g_1$ and $g_2$. If the gcd turns out to be linear, $M_2$ is found. The gcd can be computed in quadratic time in $e$ and $\log N$.

We show that when $e = 3$, the gcd must be linear. The polynomial $x^3 - C_2$ factors modulo both $p$ and $q$ into a linear factor and an irreducible quadratic factor (recall that $\gcd(e, q(N)) = 1$, hence $x^3 - C_2$ has only one root in $\mathbb{Z}_N$). Since $g_2$ cannot divide $g_1$, the gcd must be linear. For $e > 3$ the gcd is almost always linear. However, for some rare $M_1, M_2$, and $f$, it is possible to obtain a nonlinear gcd, in which case the attack fails.

For $e > 3$ the attack takes time quadratic in $e$. Consequently, it can be applied only when a small public exponent $e$ is used. For large $e$ the work in computing the gcd is prohibitive. It is an interesting question (though likely to be difficult) to devise such an attack for arbitrary $e$. In particular, can the gcd of $g_1$ and $g_2$ above be found in time polynomial in $\log e$?

**Coppersmith's Short Pad Attack**
The Franklin-Reiter attack might seem a bit artificial. After all, why should Bob send Alice the encryption of related messages? Coppersmith strengthened the attack and proved an important result on padding [7].

A naive random padding algorithm might pad a plaintext $M$ by appending a few random bits to one of the ends. The following attack points out the danger of such simplistic padding. Suppose Bob sends a properly padded encryption of $M$ to Alice. Marvin intercepts the ciphertext and prevents it from reaching its destination. Bob notices that Alice did not respond to his message and decides to resend $M$ to Alice. He randomly pads $M$ and transmits the resulting ciphertext. Marvin now has two ciphertexts corresponding to two encryptions of the same message using two different random pads. The following theorem shows that although he does not know the pads used, Marvin is able to recover the plaintext.

**Theorem 8.** Let $(N, e)$ be a public RSA key where $N$ is $n$-bits long. Set $m = [n/e^2]$. Let $M \in \mathbb{Z}_N$ be a message of length at most $n - m$ bits. Define $M_1 = 2^m M + r_1$ and $M_2 = 2^m M + r_2$, where $r_1$ and $r_2$ are distinct integers with $0 \leq r_1, r_2 < 2^m$. If Marvin is given $(N, e)$ and the encryptions $C_1, C_2$ of $M_1, M_2$ (but is not given $r_1$ or $r_2$), he can efficiently recover $M$.

**Proof.** Define $g_1(x, y) = x^e - C_1$ and $g_2(x, y) = (x + y)^e - C_2$. We know that when $y = r_2 - r_1$, these polynomials have $M_1$ as a common root. In other words, $\Delta = r_2 - r_1$ is a root of the "resultant" $h(y) = \text{res}_x(g_1, g_2) \in \mathbb{Z}_N[y]$. The degree of $h$ is at most $e^2$. Furthermore, $|\Delta| < 2^m < N^{1/e^2}$. Hence, $\Delta$ is a small root of $h$ modulo $N$, and Marvin can efficiently find it using Coppersmith's theorem (The-
orem 3). Once \( \Delta \) is known, the Franklin-Reiter attack of the previous section can be used to recover \( M_2 \) and consequently \( M \).

When \( e = 3 \), the attack can be mounted as long as the pad length is less than \( 1/9 \) the message length. This is an important result. Note that for the recommended value of \( e = 65537 \), the attack is useless against standard modulus sizes.

**Partial Key Exposure Attack**

Let \( (N, d) \) be a private RSA key. Suppose by some means Marvin is able to expose a fraction of the bits of \( d \), say, a quarter of them. Can he reconstruct the rest of \( d \)? Surprisingly, the answer is positive when the corresponding public key is small. Recently Boneh, Durfee, and Frankel [5] showed that as long as \( e < \sqrt{N} \), it is possible to reconstruct all of \( d \) from just a fraction of its bits. These results illustrate the importance of safeguarding the entire private RSA key.

**Theorem 9** (BDF). Let \( (N, d) \) be a private RSA key in which \( N \) is \( n \) bits long. Given the \( \lfloor n/4 \rfloor \) least significant bits of \( d \), Marvin can reconstruct all of \( d \) in time linear in \( e \log_2 e \).

The proof relies on yet another beautiful theorem due to Coppersmith [7].

**Theorem 10** (Coppersmith). Let \( N = pq \) be an \( n \)-bit RSA modulus. Then given the \( n/4 \) least significant bits of \( p \) or the \( n/4 \) most significant bits of \( p \), one can efficiently factor \( N \).

Theorem 9 readily follows from Theorem 10. In fact, by definition of \( e \) and \( d \), there exists an integer \( k \) such that

\[
ed - k(N - p - q + 1) = 1.
\]

Since \( d < \phi(N) \), we must have \( 0 < k < e \). Reducing the equation modulo \( 2^{n/4} \) and setting \( q = N/p \), we obtain

\[
(ed) - kp(N - p + 1) + kN = p \quad \text{mod} \quad 2^{n/4}.
\]

Since Marvin is given the \( n/4 \) least significant bits of \( d \), he knows the value of \( ed \mod 2^{n/4} \). Consequently, he obtains an equation in \( k \) and \( p \). For each of the \( e \) possible values of \( k \), Marvin solves the quadratic equation in \( p \) and obtains a number of candidate values for \( p \mod 2^{n/4} \). For each of these candidate values, he runs the algorithm of Theorem 10 to attempt to factor \( N \). One can show that the total number of candidate values for \( p \mod 2^{n/4} \) is at most \( e \log_2 e \). Hence, after at most \( e \log_2 e \) attempts, \( N \) will be factored.

Theorem 9 is known as a *partial key-exposure* attack. Similar attacks exist for larger values of \( e \) as long as \( e < \sqrt{N} \). However, the techniques are a bit more complex [5]. It is interesting that discrete log-based cryptosystems, such as the El-Gamal public key system, do not seem susceptible to partial key exposure. Indeed, if \( g^x \mod p \) and a constant fraction of the bits of \( x \) are given, there is no known polynomial-time algorithm to compute the rest of \( x \).

To conclude the section, we show that when the encryption exponent \( e \) is small, the RSA system leaks *half* the most significant bits of the corresponding private key \( d \). To see this, consider once again the equation \( ed - k(N - p - q + 1) = 1 \) for an integer \( 0 < k \leq e \). Given \( k \), Marvin may easily compute

\[
\hat{d} = [(kN + 1)/e].
\]

Then

\[
|\hat{d} - d| \leq k(p + q)/e \leq 3\sqrt{N}/e < 3\sqrt{N}.
\]

Hence, \( \hat{d} \) is a good approximation for \( d \). The bound shows that, for most \( d \), half the most significant bits of \( \hat{d} \) are equal to those of \( d \). Since there are only \( e \) possible values for \( k \), Marvin can construct a small set of size \( e \) such that one of the elements in the set is equal to half the most significant bits of \( d \). The case \( e = 3 \) is especially interesting. In this case one can show that always \( k = 2 \) and hence the system completely leaks half the most significant bits of \( d \).

**Implementation Attacks**

We turn our attention to an entirely different class of attacks. Rather than attacking the underlying structure of the RSA function, these attacks focus on the implementation of RSA.

**Timing Attacks**

Consider a smart card that stores a private RSA key. Since the card is tamper resistant, Marvin may not be able to examine its contents and expose the key. However, a clever attack due to Kocher [13] shows that by precisely measuring the *time* it takes the smartcard to perform an RSA decryption (or signature), Marvin can quickly discover the private decryption exponent \( d \).

We explain how to mount the attack against a simple implementation of RSA using the "repeated squaring algorithm". Let \( d = d_n d_{n-1} \ldots d_0 \) be the binary representation of \( d \) (i.e., \( d = \sum_{i=0}^{n} 2^i d_i \) with \( d_i \in \{0, 1\} \)). The *repeated squaring algorithm* computes \( C = M^d \mod N \), using at most \( 2n \) modular multiplications. It is based on the observation that \( C = \prod_{i=0}^{n} M^{2i} \mod N \). The algorithm works as follows:

1. Set \( z \) equal to \( M \) and \( C \) equal to 1. For \( i = 0, \ldots, n \), do these steps:
   1. If \( d_i = 1 \), set \( C \) equal to \( Cz \mod N \).
   2. Set \( z \) equal to \( z^2 \mod N \).

At the end, \( C \) has the value \( M^d \mod N \).
The variable $z$ runs through the set of values $M^2 \mod N$ for $i = 0, \ldots, n$. The variable $C$ "collects" the appropriate powers in the set to obtain $M^d \mod N$.

To mount the attack, Marvin asks the smartcard to generate signatures on a large number of random messages $M_1, \ldots, M_k \in \mathbb{Z}_N^2$ and measures the time $T_i$ it takes the card to generate each of the signatures.

The attack recovers bits of $d$ one at a time, beginning with the least significant bit. We know $d$ is odd. Thus $d_0 = 1$. Consider the second iteration. Initially $z = M^2 \mod N$ and $C = M$. If $d_1 = 1$, the smartcard computes the product $Cz = M \cdot M^2 \mod N$. Otherwise, it does not. Let $t_i$ be the time it takes the smartcard to compute $M_i \cdot M_i^2 \mod N$. The $t_i$'s differ from each other, since the time to compute $M_i \cdot M_i^2 \mod N$ depends on the value of $M_i$ (simple modular reduction algorithms take a different amount of time depending on the value being reduced). Marvin measures the $t_i$'s offline (prior to mounting the attack) once he obtains the physical specifications of the card.

Kocher observed that when $d_1 = 1$, the two ensembles $\{t_i\}$ and $\{T_i\}$ are correlated. For instance, if for some $i$, $t_i$ is much larger than its expectation, then $T_i$ is also likely to be larger than its expectation. On the other hand, if $d_1 = 0$, the two ensembles $\{t_i\}$ and $\{T_i\}$ behave as independent random variables. By measuring the correlation, Marvin can determine whether $d_1 = 0$ or 1. Continuing in this way, he can recover $d_2$, $d_3$, and so on. Note that when a low public exponent $e$ is used, the partial key exposure attack of the previous section shows that Kocher's timing attack need only be employed until a quarter of the bits of $d$ are discovered.

There are two ways to defend against the attack. The simplest is to add appropriate delay so that modular exponentiation always takes a fixed amount of time. The second approach, due to Rivest, is based on blinding. Prior to decryption of $M$ the smartcard picks a random $r \in \mathbb{Z}_N^2$ and computes $M' = M \cdot r^e \mod N$. It then applies $d$ to $M'$ and obtains $C' = (M')^d \mod N$. Finally, the smartcard sets $C = C'/r \mod N$. With this approach, the smartcard is applying $d$ to a random message $M'$ unknown to Marvin. As a result, Marvin cannot mount the attack.

Kocher recently discovered another attack along these lines called power cryptanalysis. Kocher showed that by precisely measuring the smartcard's power consumption during signature generation, Marvin can often easily discover the secret key. As it turns out, during a multiprecision multiplication the card's power consumption is higher than normal. By measuring the length of high consumption periods, Marvin can easily determine if in a given iteration the card performs one or two multiplications, thus exposing the bits of $d$.

**Random Faults**

Implementations of RSA decryption and signatures frequently use the Chinese Remainder Theorem to speed up the computation of $M^d \mod N$. Instead of working modulo $N$, Bob first computes the signatures modulo $p$ and $q$ and then combines the results using the Chinese Remainder Theorem. More precisely, Bob first computes

$$C_p = M^{dp} \mod p \quad \text{and} \quad C_q = M^{dq} \mod q,$$

where $dp = d \mod (p - 1)$ and $dq = d \mod (q - 1)$. He then obtains the signature $C$ by setting

$$C = T_1 C_p + T_2 C_q \mod N,$$

where

$$T_1 = \begin{cases} 1 \mod p \\ 0 \mod q \end{cases} \quad \text{and} \quad T_2 = \begin{cases} 0 \mod p \\ 1 \mod q \end{cases}.$$

The running time of the last CRT step is negligible compared to the two exponentiations. Note that $p$ and $q$ are half the length of $N$. Since simple implementations of multiplication take quadratic time, multiplication modulo $p$ is four times faster than modulo $N$. Furthermore, $dp$ is half the length of $d$, and consequently computing $M^{dp} \mod p$ is eight times faster than computing $M^d \mod N$. Overall signature time is thus reduced by a factor of four. Many implementations use this method to improve performance.

Boneh, DeMillo, and Lipton [3] observed that there is an inherent danger in using the CRT method. Suppose that while generating a signature, a glitch on Bob's computer causes it to miscalculate in a single instruction. For instance, while copying a register from one location to another, one of the bits is flipped. A glitch may be caused by ambient electromagnetic interference or perhaps by a rare hardware bug, like the one found in an early version of the Pentium chip. Given an invalid signature, Marvin can easily factor Bob's modulus $N$.

We present a version of the attack as described by A. K. Lenstra. Suppose a single error occurs while Bob is generating a signature. As a result, exactly one of $C_p$ or $C_q$ will be computed incorrectly. Say $C_p$ is correct, but $C_q$ is not. The resulting signature is $\tilde{C} = T_1 C_p + T_2 C_q$. Once Marvin receives $\tilde{C}$, he knows it is a false signature, since $\tilde{C}^e \neq M \mod N$. However, notice that

$$\tilde{C}^e = M \mod p \quad \text{while} \quad \tilde{C}^e \neq M \mod q.$$

As a result, $\gcd(N, \tilde{C}^e - M)$ exposes a nontrivial factor of $N$.

For the attack to work, Marvin must have full knowledge of $M$; namely, we are assuming Bob does not use any random padding procedure. Ran-
dom padding prior to signing defeats the attack. A simpler defense is for Bob to check the generated signature before sending it out to the world. Checking is especially important when using the CRT speedup method. Random faults are hazardous to many cryptographic systems. Many systems, including a non-CRT implementation of RSA, can be attacked using random faults [3]. However, these results are far more theoretical.

**Bleichenbacher’s Attack on PKCS 1**

Let $N$ be an $n$-bit RSA modulus and $M$ be an $m$-bit message with $m < n$. Before applying RSA encryption it is natural to pad the message $M$ to $n$ bits by appending random bits to it. An old version of a standard known as Public Key Cryptography Standard 1 (PKCS 1) uses this approach. After padding, the message looks as follows:

\[
\begin{array}{ccc}
02 & \text{Random} & 00 \quad M \\
\end{array}
\]

The resulting message is $n$ bits long and is directly encrypted using RSA. The initial block containing "02" is 16 bits long and is there to indicate that a random pad has been added to the message.

When a PKCS 1 message is received by Bob’s machine, an application (e.g., a Web browser) decrypts it, checks the initial block, and strips off the random pad. However, some applications check for the "02" initial block, and if it is not present, they send back an error message saying "invalid ciphertext". Bleichenbacher [2] showed that this error message can lead to disastrous consequences: using the error message, Marvin can decrypt ciphertexts of his choice.

Suppose Marvin intercepts a ciphertext $C$ intended for Bob and wants to decrypt it. To mount the attack, Marvin picks a random $r \in \mathbb{Z}_N^*$, computes $C' = rC \mod N$, and sends $C'$ to Bob’s machine. An application running on Bob’s machine receives $C'$ and attempts to decrypt it. It either responds with an error message or does not respond at all (if $C'$ happens to be properly formatted). Hence, Marvin learns whether the most significant 16 bits of the decryption of $C'$ are equal to 02. In effect, Marvin has an oracle that tests for him whether the 16 most significant bits of the decryption of $rC \mod N$ are equal to 02, for any $r$ of his choice. Bleichenbacher showed that such an oracle is sufficient for decrypting $C$.

**Conclusions**

Two decades of research into inverting the RSA function produced some insightful attacks, but no devastating attack has ever been found. The attacks discovered so far mainly illustrate the pitfalls to be avoided when implementing RSA. At the moment it appears that proper implementations can be trusted to provide security in the digital world.

We categorized known attacks on RSA into four categories: (1) elementary attacks that exploit blatant misuse of the system, (2) low private exponent attacks serious enough that a low private exponent should never be used, (3) low public exponent attacks, (4) and attacks on the implementation. These last attacks illustrate that a study of the underlying mathematical structure is insufficient. Throughout the paper we observed that many attacks can be defeated by properly padding the message prior to encryption or signing.

The first twenty years of RSA have led to a number of fascinating algorithms. My hope is the next twenty will prove to be equally exciting.

Mary Cartwright died in Cambridge, England, on April 3, 1998, at the age of ninety-seven. Cartwright led a distinguished career in mathematics and university administration. During her career Cartwright authored over ninety articles, making important contributions to the theory of functions and differential equations. Her early work led to significant results concerning Dirichlet series, Abel summation, directions of Borel spreads, analytic functions regular on the unit disk, the zeros of integral functions, maximum and minimum moduli, and functions of finite order in an angle. She is particularly well known for her work with J. E. Littlewood on van der Pol's equation, nonlinear oscillators, and the development of topological techniques to prove existence theorems. Her later work includes contributions to the theory of cluster sets in collaboration with Edward Collingwood.

Cartwright and Littlewood were among the first mathematicians to recognize that topological and analytical methods could be combined to efficiently obtain results for various problems in differential equations, and their results helped inspire the construction of Smale's horseshoe diffeomorphism. Their names can be included with those mathematicians, including Levinson, Mastersky, Liapounov, Kryloff, Bogoliuboff, Denjoy, Birkhoff, and Poincaré, whose work provided an impetus to the development of modern dynamical theory.

In addition to her research, Cartwright took a keen interest in mathematical education at all levels. She was an effective administrator at Cambridge University and ambassador for several mathematical and scientific organizations. She is remembered as a person who had a gift for going to the heart of a matter and for seeing the important point, both in mathematics and human affairs.

Cartwright received many honors. In particular, she was elected a Fellow of the Royal Society of London in 1947. Until Dusa McDuff was elected in 1994, Cartwright remained the only woman mathematician in the Royal Society. She received honorary doctorates from the universities of Edinburgh, Leeds, Hull, Wales, and Oxford. In 1969 Queen Elizabeth II elevated her to Dame Commander of the British Empire.

Mary Cartwright was born in Aynho, Northamptonshire, England, on December 17, 1900, into a family with a tradition of public service. She matriculated at St. Hugh's, Oxford, in the fall of 1919 and decided to pursue the honors mathematics program instead of her long-time favorite subject, history. Lectures were difficult to get into due to the flood of men recently released from the army. Cartwright went to the lectures she could and obtained notes from the others. After two years she received a second class on the Mathematical Moderations Examination. Although very few firsts were given that year, Cartwright was disappointed and seriously considered changing her focus to his-
tory. After considerable deliberation she concluded that she was hooked on the theory of residues. She joked that history would entail longer hours of work anyway. Her decision to remain in mathematics did not diminish her interest in history. Many of her mathematical papers include historical perspectives that add an interesting dimension to her work. She also wrote several biographical memoirs that portray her exceptional sense of history.

Near the end of Cartwright's third year at Oxford, an important event in her mathematical career occurred at a well-chaperoned party. She was introduced to V. C. Morton, who told her that if she was really serious about mathematics she should read Whittaker and Watson's *Modern Analysis* and attend the evening classes of G. H. Hardy, then Savilian Professor of Geometry. Taking Morton's advice, she read *Modern Analysis* that summer and received special permission to attend Hardy's class. She found Hardy's lectures inspiring. With Hardy serving as an examiner, she received a first class in the Final Honours School Examination in Mathematics, obtaining her degree from Oxford in 1923.

During the next four years, Cartwright taught mathematics, first at the Alice Ottley School in Worcester and then at the Wycombe Abbey School in Buckinghamshire, where she also served as assistant mistress. Cartwright began to feel sidetracked by her mounting administrative duties. In addition, teaching and method content were strictly dictated at the school. Having no room to experiment led Cartwright to feel discontent with her career. She felt she had to return to mathematics research, and in January 1928 she arranged to join Hardy's group of research students at Oxford. Hardy's class consisted of an hour lecture followed by tea, biscuits, and talk about mathematics and mathematicians.

Cartwright's mathematical talent blossomed in the seminar. One evening Hardy gave a list of problems in his seminar, one of which referred to an application of Abel's method of summation to Dirichlet series. Hardy was amazed when Cartwright completely solved the problem by contour integration. Her work on generalized Abel summability with applications to Fourier series was published that year and also appears in the index of Hardy's book on divergent series.

E. C. Titchmarsh, who succeeded Hardy as Savilian Professor at Oxford, became Cartwright's supervisor while Hardy was at Princeton during the 1928-29 academic year. During an interview in 1990, Cartwright recalled that Titchmarsh was a good supervisor and his suggestions suited her well. Both Hardy and Titchmarsh inspired Cartwright's interest in the theory of functions of complex variables. Cartwright completed her D.Phil. when Hardy returned to Oxford. Fortuitously, J. E. Littlewood served as an external examiner. Littlewood recalled that the first question by the other examiner was so silly and unreal as to make her blush, but he thought he helped to restore her nerve with a wink. Her thesis on the zeros of integral functions generated a series of papers and eventually led to her book on integral functions.

In October of 1930, financed by a Yarrow Research Fellowship, Cartwright continued her work in the theory of functions at Girton College, Cambridge. During this time she attended several of Littlewood's courses and seminars. She drew Littlewood's attention when she obtained the right order of magnitude for the maximum modulus of multivalent functions, a problem that Littlewood had presented in his theory of functions class. Her result is:

**Cartwright's Theorem.** Suppose \( w(z) = \sum_{n=0}^{\infty} a_n z^n \) is regular for \( |z| < 1 \). Let \( r < 1 \). If \( w(z) \) takes no value more than \( p \) times in \( |z| < 1 \), then \( |w(z)| < A(p) \mu (1 - r)^{-2p} \) for all \( |z| < r \), where \( \mu = \max(|a_0|, |a_1|, |a_2|, \ldots, |a_p|) \) and \( A(p) \) is a constant depending only on \( p \).

Cartwright was the first to obtain significant results for \( p \)-valent functions, and she did so using some rather unconventional methods. She used the conformal mapping technique pioneered by Ahlfors to prove the theorem and show that an entire function of order \( \rho \) has at most \( 2\rho \) asymptotic values. She had learned about the technique in her lectures from E. F. Collingwood. W. K. Hayman described the technique in a talk given on the occasion of Cartwright's ninetieth birthday. According to Hayman, Ahlfors mapped a strip-like domain \( S \) onto a strip \( R = \{ |\eta| < \frac{\pi}{4} \} \) in the \( \zeta = \xi + i\eta \) plane. If \( S \) meets the line \( \sigma = t \) in one or more segments of length at most \( \theta(t) \) and if \( s = \sigma + it \) corresponds to \( \zeta = \xi + i\eta \), then Ahlfors showed that the map grows at least as fast as in the case where \( S \) is itself a strip. Suppose now that \( f(z) \) is \( p \)-valent in the unit disk \( \Delta = \{ |z| < 1 \} \), and assume for simplicity that \( f(z) \neq 0 \). Those who have had dealings with the zeta function may recall that zeros can give rise to problems. However, in this case the damage can be limited, since \( f(z) \) can have at most \( p \) zeros. Map \( \Delta \) onto the strip \( R \) by \( \zeta = \log(\frac{1 + z}{1 - z}) \), and consider \( s = \log(f(z(\zeta))) \) as a function of \( \zeta \). Unfortunately this is not a 1-1 map if \( p > 1 \). However, if we consider a level curve \( \sigma = t \), then the variation of the argument \( \tau \) on such a curve cannot be more than \( 2\pi p \). Thus \( \theta(t) \leq 2\pi p \).

Cartwright was able to adapt Ahlfors's technique to her situation and deduce that

\[
\sigma = \log |f| \leq 2p \xi + O(1) \leq 2p \log \left( \frac{1}{1 - |\xi|} \right) + O(1),
\]

which yields her theorem.
Littlewood was impressed with Cartwright's creativity in adapting Ahlfors's Distortion Theorem to such a different situation. Her polished proof was published in *Mathematische Annalen* in 1935, and her results are referred to in Littlewood's *Lectures on the Theory of Functions*. Her paper inspired a great deal of work and was later improved by D. C. Spencer. Cartwright's Theorem is still frequently quoted and applied in signal processing and is perhaps her most important work in the theory of functions.

Cartwright's mathematics flourished during the 1930s, and she published several papers on integral functions, meromorphic functions, and analytic functions with essential singularities. Cartwright's work included descriptions of the subtle phenomena that can appear near fractal boundaries and has found some new applications in this field. Collingwood provided a great deal of assistance with her work on entire integral functions and refereed nearly all of her papers published in the *Proceedings of the London Mathematical Society*. Her work on directions of Borel sets in *Comptes Rendus* was noted by G. Valiron in his lectures at the Zürich International Congress in 1932. Both Valiron and Cartwright are known for some of the earliest results concerning meromorphic functions sharing a level curve or set. She collaborated with L. S. Bosanquet in the early 1930s, and they coauthored two papers, the first on the Hölder and Cesàro means of an analytic function and the second on Tauberian theorems. In the former paper the authors obtain results on the limiting behavior of Cesàro means $C^{(k)}(z)$ as $z \to 0$ and show that the results still hold when the $C^{(k)}(z)$ are replaced by Hölder means. The authors also obtain results of the type of Montel's theorem for bounded means. Two typical results of their work on Tauberian theorems are the following. In both, let $f(z) = \sum_{n=0}^{\infty} a_n z^n$.

**Theorem.** Fix $\alpha \leq -1$ and a positive integer $\lambda$, and let $f(z) = (1 - z)^{-1} \int_0^z f(x-1) dx$. If the $(C, \alpha)$ sums of $\sum_{n=0}^{\infty} a_n$ are bounded and if $f(z) \to A$ as $z \to 1$ along some arc $\arg(1 - z) = \gamma$ with $0 \leq |\gamma| < \pi/2$, then the series $\sum a_n$ is $(C, \alpha + \delta)$ summable for every $\delta > 0$.

**Theorem.** Fix $\alpha$ with $0 < \alpha < \pi/2$ and $y$ with $0 \leq |y| < \alpha$. Suppose all $a_n$ are real and $f(z) = O(\exp((-1 - |z|)^{-\pi/2})(z))$ as $z \to 1$ in $|z| < 1$. If $f(z) \to A$ as $z \to 1$ along the arc $\arg(1 - z) = \gamma$, then $f(z) \to A$ when $z \to 1$ within the set $|\arg(1 - z)| \leq \gamma$.

Cartwright's work prompted Hardy, who had moved to Cambridge in 1931, and Littlewood to recommend her for an Assistant Lectureship in Mathematics. In 1934 she was appointed to a College Lectureship in Mathematics and a Staff Fellowship. Cartwright became a part-time University Lecturer in Mathematics in 1935. At Girton, Carterwright also came under the influence of the director of studies, Frances E. Cave-Brown-Cave, who had finished just behind Hardy on the 1898 Cambridge Mathematical Tripos. In 1936 she succeeded Cave-Brown-Cave as director of studies in mathematics. She served as director until 1949.

In January of 1938 the Radio Research Board of the Department of Scientific and Industrial Research issued a memorandum requesting the expert guidance of pure mathematicians with nonlinear differential equations used in the modeling of radio and radar technology. Some of the problems presented in the literature intrigued Cartwright. At the time it seemed curious that such problems would appeal to her, since her interests lay with complex analysis and not dynamics. In hindsight, she believed that she intuitively recognized the topological implications of the problems.

Cartwright sought Littlewood's assistance in helping her understand the dynamical aspects of radio research, and in so doing they embarked on a ten-year collaboration. Their work was influenced by the mathematics of Poincaré, Birkhoff, and Bendixon, among others. Cartwright considered the area of nonlinear oscillations "a curious branch of mathematics developed by different people from different standpoints—straight mechanics, radio oscillations, pure mathematics and servo-mechanisms of automatic control theory." At the time, much of the nonlinear theory was concerned with equations of the form

$$\ddot{x} + f(x)x + g(x) = p(t),$$

where $p(t)$ has period $2\pi/\lambda$, $g(x)$ behaves in a somewhat similar manner to a restoring force, and the damping $f(x)$, sometimes $f(x, x)$, is usually positive for large $|x|$. For such equations the principle of superposition does not hold. One of the most famous of such equations is that introduced by van der Pol in 1920:

$$\ddot{x} - k(1 - x^2)\dot{x} + x = bk\lambda \cos \lambda t.$$

Even when the forcing term $bk\lambda \cos \lambda t$ is zero, the general solution to van der Pol's equation cannot be obtained by the combination of two linearly independent solutions.

The first big problem studied by Cartwright and Littlewood concerned the amplitude of the stable periodic solution of van der Pol's equation without forcing terms. Van der Pol used this equation as the basic model for a triode oscillator, since it retained the essential features of the situation being experimented with by radio engineers. Van der Pol's research seemed to imply convergence to a periodic solution with amplitude 2. Cartwright and Littlewood proved that when $k$ is large, all nontrivial solutions converge to a periodic solution whose amplitude tends to 2 as $k \to \infty$. 

\[216\]

**NOTICES OF THE AMS**

**VOLUME 46, NUMBER 2**
When the nonlinear term of equation (2) is large—that is, when \( k \) is large—van der Pol's equation represents a relaxation oscillator. The next problem considered by Cartwright and Littlewood was whether this equation could have two stable periodic solutions with different periods in this situation. Such a phenomenon had been suggested by experiments. During their investigations Cartwright and Littlewood were considerably influenced by Levinson's 1944 paper "Transformation theory of nonlinear differential equations of the second order". This paper laid the foundations of a general topological approach to nonautonomous periodic second-order differential equations. Cartwright and Littlewood expanded their research on equation (2) to the generalized form of van der Pol's equation, equation (1), and showed the existence of two stable sets of subharmonics of different orders. Their results led to some rather interesting mappings, and their topological approach to the problem led to several unsolved problems in topology. The inner and outer edges of the boundary between the domains of attraction of the two sets had different rotation numbers under the diffeomorphism corresponding to advancing the solutions of (2) through one period, leading to the conclusion that the boundary could not be a Jordan curve and was most likely to be an indecomposable continuum. Cartwright and Littlewood's fine structures are recognized by contemporary mathematics as typical manifestations of the "butterfly effect".

In their work Cartwright and Littlewood made use of an analytic transformation, developed by Birkhoff, of the plane into itself with complicated invariant curves. They were among the earliest mathematicians to associate such transformations with a simple differential equation. The diffeomorphism indicated that the nonstable periodic solutions and subharmonics of the equation corresponded to fixed points of the set. This led Cartwright and Littlewood to develop some original fixed-point theorems for continua invariant under a diffeomorphism of the plane. In particular, they needed a fixed-point theorem that would apply to a bounded invariant continuum whose complement is a single simply connected domain that may not have a Jordan curve tending to it. The theorem they developed is stated below. This theorem is more general than Brouwer's fixed-point theorem, since \( I \) need not be locally connected; however, the conditions on \( T \) are more restrictive. One application of their theorem is to an area-preserving twist homeomorphism of the annulus.

**Cartwright & Littlewood Fixed-Point Theorem.** If \( T \) is a 1-1 continuous and orientation-preserving transformation of the whole plane into itself that leaves a bounded continuum \( I \) invariant and if \( T(I) \) is a single simply connected domain, then \( I \) contains a fixed point.

It eventually became evident that the van der Pol oscillator provided an example of a stable chaotic system. Dissipation in the van der Pol oscillator meant that the system's shape in phase space would contract. A complex combination of transformations was necessary to fully represent the system in phase space, inspiring Smale's construction of the horseshoe diffeomorphism, the cornerstone of the modern theory of chaos.

Cartwright and Littlewood's collaboration produced some of the earliest fully rigorous work in relaxation oscillations. According to J. Guckenheimer, none of Levinson, Cartwright, and Littlewood carried through an analysis of the strange asymptotic behavior exhibited by some solutions, since adequate tools to do so were not then available. However, the results they obtained on the periodicity and stability of solutions of nonlinear differential equations influenced the development of the modern theory of dynamical systems, and there has been an enormous expansion of the subject since their work was completed. Modern techniques have enabled contemporary mathematicians to carry through a more thorough analysis of the exotic behavior of solutions to the forced van der Pol equation. For example, N. G. Lloyd proved the Cartwright-Littlewood conjecture that there is only one stable oscillation for \( b > 2/3 \). Also, Guckenheimer and Levi have each used modern methods from dynamical systems to give a more complete analysis of the phenomena that appear in the forced van der Pol equation.

The bulk of Cartwright and Littlewood's collaborative work was completed in the mid-1940s and contributed to her election as a Fellow of the Royal Society of London in 1947. When asked if she felt there was any prejudice toward women at Cambridge or within the Royal Society, Cartwright responded that during her time she never felt as if there was. She even felt favored and preferred to men available on many occasions, for example, when representing the London Mathematical Society, the Cambridge Philosophical Society, and

*Dame Mary teaching, around 1970.*
Cambridge University at the Centenary of Henri Poincaré. She explained that although very few women had been elected to the Royal Society, there were also few women combining research and teaching. In addition, she noted that “hordes of men are put up for election and never get in.”

In the years during and following the Second World War, Cartwright carried out a very full program of teaching and research at Girton. She collaborated with Littlewood, who was commandant of the college's Red Cross detachment from 1940 to 1944, and she worked with Copson and Greig to publish a thorough expository article on nonlinear vibrations. Her Girton students were at first apt to find her rather frail and timid. Closer acquaintance quickly dispelled that impression. Cartwright was a no-nonsense person with a wry sense of humor. It was said that even Hardy ducked when she threw her hardball.

In July of 1948 Cartwright was pre-elected mistress of Girton. Before taking up office, she spent the early part of 1949 lecturing on nonlinear differential equations in the United States at the invitation of John Curtis, Solomon Lefschetz, and Mina Rees. She spent three weeks at Stanford and one week at UCLA as a visiting professor. She spent several more weeks lecturing at Princeton as a consultant under the Office of Naval Research, since Princeton did not allow for women faculty. Lecture notes from her Princeton seminar appear in a 1950 volume in the series Annals of Mathematics Studies.

Upon her return to Cambridge, Cartwright's life changed dramatically when she took up the responsibilities of mistress of Girton. The women's colleges had just become full members of the University during the previous year. Cartwright's quiet, unassuming, and clear-headed leadership helped the college to adapt and take its place in the University. However, becoming mistress did put many administrative duties on her agenda. Demands from various University committees were very heavy. Her commitments included service as chairman of the Cambridge University Women's Appointments Board, service on the Education Syndicate, and two terms on the Board Council of the Cambridge University Senate.

Although Cartwright found it impossible to refuse to be elected mistress of Girton, she did refuse to take on all but a few research students and “those for some special reason.” She believed that perhaps being head of a college and trying to avoid too many research students stopped her promotion to full professor. Her research students included Sheila Scott (Macintyre); Hilary Shuard, who did not take a D.Phil. but did become a prominent figure in the Teaching Training World; Barbara Maitland, who became a Lecturer at Liverpool; Marc Noble, who became a professor of mathematics at the University of Canterbury; James Ejelio, who became a professor, and vice-chancellor for a time, at Nsukka University of Nigeria; Carl Lindon, who taught at the University College of Swansea; W. K. Hayman, who is a Fellow of the Royal Society and was awarded the Berwick Prize from the London Mathematical Society; and Chike Obi, a self-taught Nigerian, who was taken over by Littlewood and became a professor at Layos University. Cartwright was reportedly an excellent supervisor who gave due encouragement and took great care in reading and criticizing her students' work, both in content and form. Hayman recalls that Cartwright was a marvelous supervisor who was never discouraging. She corrected, but did not put down. Her advice was always available and pointed, and her conversation interesting and varied. She was noted for being meticulous about English grammar and syntax. In addition, Hayman says, "Mary taught me that proofs must be supplied by the writer and not the reader and that we had to refer to previous authors and what they had done."

After completing her collaborative work with Littlewood and becoming mistress of Girton, Cartwright claimed that her burden of administrative duties prevented her from devoting herself wholeheartedly to mathematics. However, in the years between 1950 and 1989 she still managed to publish several papers in differential equations, most using topological methods, as well as some research in theory of functions, some expository articles, memorial articles, and papers with historical and biographical interest, including historical research on the Hardy-Littlewood-Paley-Riesz circle from the 1920s and 1930s. Her book *Integral Functions* was published in 1956 and exceeded in depth and precision anything that had gone before. The book was heavily based on work
that she had almost finished when the war began in 1939. In 1960 she proved some interesting results about solutions to a third-order differential equation using Lyapunov functions. In the mid-1960s she wrote papers that addressed the importance of linking topological results more closely with the theory of differential equations. Even though she was not a topologist by training, she believed that mathematicians ought to make fuller use of the topological way of thinking in formulating problems. In the 1970s she collaborated with H. P. F. Swinnerton-Dyer, co-writing three papers on boundedness theorems for second-order differential equations. And as late as 1987, with G. E. H. Reuter she coauthored a paper on periodic solutions of van der Pol’s equation with large parameters. However, regarding her research after 1950, she is probably best known for her work with Collingwood in the theory of cluster sets.

Cartwright and Collingwood had worked together before the war. They resumed their collaboration around 1950 when Collingwood pointed out that in her 1936 paper “On the behaviour of an analytic function in the neighborhood of its essential singularities” she had not taken into account the possibility that a function analytic in the unit disk might tend to a limit along a spiral touching the boundary or along an oscillating curve. Recognition of the too-strong hypothesis led them to redevelop the theory from a more general point of view, culminating in the famous Collingwood-Cartwright theory of cluster sets, in which they developed boundary uniqueness theorems for meromorphic functions on \(|z| < 1\). Results in the first part of the paper belonged to what they called boundary theory in the large. In the second part of their paper they established a system of boundary theorems in the small corresponding to their previously proved boundary theorems in the large. Here they study the behavior of \(f(z)\) near a selected point \(z = e^{i\theta}\) of the boundary. In their introduction they say that the central idea of their method was derived from Iversen’s theory of the inverse function. It consists in the continuation of an ordinary or algebraic element of the inverse function along an appropriate path free from nonalgebraic singularities. They define the expressions \(C(f)\), \(R(f)\), and \(\Gamma(f)\) as follows:

1. \(C(f)\) denotes the set of cluster values of \(f\). A point \(a\) is a cluster value of \(f(z)\) if there is a point \(z_0\) of the boundary \(|z| = 1\) and a sequence \(\{z_n\}\), \(|z_n| < 1\), such that \(\lim_{n\to\infty} z_n = z_0\) and \(\lim_{n\to\infty} f(z_n) = a\).

2. \(R(f)\) denotes the range of values of \(f\). A point \(a\) is an element of \(R(f)\) if there is a sequence \(\{z_n\}\), \(|z_n| < 1\), such that \(\lim_{n\to\infty} |z_n| = 1\) and \(f(z_n) = a\) for all values of \(n\).

3. \(\Gamma(f)\) denotes the set of asymptotic values of \(f\). A point \(a\) is an asymptotic value of \(f(z)\) if there is a continuous simple path \(z = z(t), \alpha < t < 1\), such that \(|z(t)| < 1\), \(\lim_{t\to\alpha} |z(t)| = 1\), and \(\lim_{t\to\alpha} f(z(t)) = a\).

With these definitions, the main theorem of Cartwright and Collingwood is as follows.

**Theorem.** If \(f(z)\) is meromorphic in \(|z| < 1\), then the following relations are satisfied:

(i) If \(\Gamma(f)\) is unrestricted, then the union of the frontiers of \(C(f)\) and \(R(f)\) is equal to the intersection of \(C(f)\) and the closure of the complement of \(R(f)\). In addition, this set is contained in the closure of \(\Gamma(f)\).

(ii) If \(\Gamma(f)\) is of linear measure zero, then it contains the complement of \(R(f)\).

In each of the above, the complement is with respect to the closed complex plane.

Cartwright and Collingwood’s work on cluster sets led to some of Collingwood’s best work, culminating in his presidency of the London Mathematical Society. Their other paper was published in 1961 and contains an extension of various results on asymptotic values and ranges of values to the derivatives of the function considered.

Cartwright’s colleagues recall that she never seemed harried. During her entire tenure as mistress of Girton she exhibited a readiness to look ahead and to respond to new needs by adopting new practices. It meant a great deal to the College that their mistress contributed to the advance of knowledge in her own field as well as devoting time and energy to the College’s concerns. Cartwright served as president of the Mathematical Association from 1951 to 1952. In 1956 she was appointed a member of the Royal Society’s delegation to the Soviet Union and Poland. Cartwright attended conferences, and she visited Moscow University and the Polish Academy of Sciences at Warsaw. In 1959 she was promoted to Reader in the Theory of Functions at Cambridge. She served as president of the London Mathematical Society from 1961 to 1963. After her retirement from Girton in 1968 she held visiting professorships at universities in England, America, and Poland before returning to Cambridge, where she was one of the editors of *The Collected Papers of G. H. Hardy*.

Cartwright fondly remembered her academic travels to the United States and Europe, and in later years she enjoyed telling stories of her travels over lunch at Girton. She spent the academic year 1968–69 as a resident fellow at Brown University. During her stay, she was particularly impressed by the students at Brown who were putting a great deal of pressure on the administration to change the curriculum. She spent the next academic year as a visiting professor at the Claremont Graduate College, Professor of the Royal Society to Poland, and Visiting Professorial Fellow at the University of Wales. Both she and some of her colleagues at the Claremont Colleges clearly remembered that
Faculty Positions

Located in North Central PA, the Pennsylvania College of Technology is Pennsylvania’s premier technical college and an affiliate of The Pennsylvania State University. Penn College currently offers 68 programs leading to associate degrees and 22 baccalaureate programs. The School of Integrated Studies is accepting applications for the following anticipated positions to start fall 1999 semester, August 16, 1999.

Mathematics

The faculty will instruct and evaluate students in mathematics which may include, but not be limited to: Introduction to Mathematics, Technical Algebra and Trigonometry, College Algebra and Trigonometry, Statistics, and Geometry. Qualifications: Master’s Degree in Mathematics, Mathematics Education, or related discipline with emphasis in mathematics; two years equivalent full-time college-level teaching experience, ability to teach creatively and effectively; familiarity with the use of technology in instruction, including microcomputers and graphing calculators; and an interdisciplinary approach to education. An earned Doctorate or Doctorate near completion in Mathematics, Mathematics Education, or related discipline with emphasis in mathematics is highly desired.

Mathematics (Developmental/Career)

The faculty will instruct and evaluate students in mathematics which may include, but not be limited to: Basic Arithmetic and Algebra, Career Mathematics, and Technical Algebra and Trigonometry. Qualifications: Master’s Degree in Mathematics, Mathematics Education, or related discipline with emphasis in mathematics; two years equivalent full-time teaching experience at the secondary or college level; ability to teach creatively and effectively, familiarity with the use of technology in instruction, including microcomputers and graphing calculators; and an interdisciplinary approach to education. An earned Doctorate or Doctorate near completion in Mathematics, Mathematics Education, or related discipline with emphasis in mathematics is highly desired.

Finalists must present a sample lesson. Salary will be commensurate with credentials. Excellent insurance and educational benefits for employee and family at Penn College and Penn State. Submit a letter of interest, resume, and names, addresses, and telephone numbers of three professional references to: Human Resources (232), Pennsylvania College of Technology, One College Avenue, Williamsport, PA 17701.

For maximum consideration, the deadline for receipt of application materials is February 2, 1999; however, positions will remain open until suitable candidates are identified. For additional information about Penn College and a detailed job announcement, please see our Internet Web site at http://www.pct.edu or call (717) 327-4770.

An affirmative action/equal opportunity employer.
Women and minorities encouraged to apply.

she broke her hip in a bicycle accident. The following academic year she was a visiting professor at Case Western Reserve. She was elected an honorary member of the Institute of Mathematics and received a medal from the University of Finland.

Cartwright was a pioneer in many senses. She was the first woman to achieve a first class on the Oxford Finals, one of the first women to be elected to the Royal Society, the first woman to sit on its Council, and the first woman to receive its Sylvester Medal (1964)—for her “distinguished contributions to analysis and the theory of functions of a real and complex variable.” She was, as of this writing, the only woman elected president of the London Mathematical Society (1961–63) and the only woman to receive its De Morgan Medal (1968).

Cartwright obtained immense satisfaction from doing mathematics. She believed that a number of major developments in pure mathematics were first thought out in terms of real-world situations. When asked what her favorite paper was, she gave the ultimate mathematician’s reply: “...the one I was working on at the moment.”

Interview with AMS
President Arthur Jaffe

On January 31, 1999, Arthur Jaffe will complete his term as president of the AMS. In this interview with Notices deputy editor and senior writer Allyn Jackson, Jaffe reflects on his time as president and describes some of the main issues on which he worked. An interview with president-elect Felix Browder is planned for the March issue of the Notices.

Notices: What were your main accomplishments as AMS president?
Jaffe: During my term I have strived to increase the visibility of mathematicians in the realm of public science policy. This global goal subsumes many particular issues on which we have made some progress.

Someone wanting to know details about these questions should read my semiannual reports to the AMS Executive Committee and Board of Trustees. Briefly, my three years as an officer fall into three periods. During each year I focused on one major theme, aside from my normal AMS duties. The year as president-elect plunged the AMS into the problems of the mathematics department at the University of Rochester. This experience taught me the importance of working together with other science disciplines to achieve a common goal. The second year led to forming the ad-hoc coalition of science society presidents, with the goal in 1997 to begin to reverse a steady, five-year decline in federal science funding. (Science funding in every federal agency declined during that period, except for the National Institutes of Health.) This effort began at a fortuitous time. In the background of predictions by the American Association for the Advancement of Science of dramatic future declines in science funding by the year 2002, we saw the federal budget come into balance. This has allowed the start of a national pro-science movement in Congress itself, a movement we have helped along, encouraged, and worked with. Eventually it also spread to the executive branch of the government. During my third year we have focused on advocating investigator-initiated basic research. I believe this is the most important question for the future. We need to come to grips with how mathematics funds are spent. Above all, in the future we need to focus more and more on our most valuable resource, people. We need to repeat this point of view whenever we can, both to the agencies and to our representatives.

The starting point of this argument is that mathematics is important for the future of our society. We can base this case on history, but we need to make this point over and over. Mathematics has been the enabling subject for science, engineering, and also for business. It will remain that way in the future. But we need to have a coherent explanation why. The man in the street needs to appreciate mathematics before we get a lasting commitment from the members of Congress and the president. Once we make the case that our scientific future rests on preserving our mathematical strength, we are not finished. We need to ensure our ability to attract the brightest young people into mathematics, and we need to retain them. This means that we should support mathematicians, not just when they begin their studies, but as long as they remain innovative at the forefront of research developments.

In recent years we have seen more and more government funding going into directed programs. For the health of mathematics, we need to refocus attention on people. In order to do this we need a vision that transcends the short-term goals of the funding agencies; we should play a greater role in the formulation of these goals by the agencies.

As a candidate for president I wrote about the importance of advocacy for mathematics. I still believe in this, but I have also learned that it is important not just to advocate mathematics but to advocate science as a whole. This is why I started to work with organizations like the American Chemical Society and the American Physical Society. Starting with their presidents as partners, we put together the ad-hoc coalition as a way to achieve common goals. We spent about a year working on this, and now it has grown to encompass 110 presidents of organizations with 3.5 mil-
Outgoing AMS President Arthur Jaffe.

lion members. These presidents signed statements in support of scientific research. But statements are not enough. We also met with key people in Washington to explain our point of view and to help shape the future.

Just one direct conversation with a member of Congress or with a senator can have a big impact. Members are even busier people than we are, so they do not get to talk to lots of others about science. When you do get to meet a member in person, it is a memorable experience on both sides. Ultimately the future success in funding science and mathematics depends upon mathematicians and scientists in the community making sure that the public realizes that research is important.

Notices: How in a practical way do you see mathematicians and scientists doing this?

Jaffe: There are only 535 congressmen and senators. Therefore, if just a couple of people make personal contact with each of these 535 representatives, the problem would be solved by the action of only 0.05% of the members alluded to above. This is a realistic goal, and it would begin a national grass-roots movement for science. By mathematicians' being a major player in this way, mathematicians will also be at the table when research policies are designed; mathematicians will frame them along with other scientists.

As a small example, look at some events of quite diverse character organized by the Society. First, our two successful congressional briefings (one on data analysis and the other on encryption) drew extraordinarily large audiences exceeding all expectations. Furthermore, they were well received. We should build on these successes.

A second type of event were the Town Meetings organized by the AMS, one at the headquarters office in Providence and one at the office of Mathematical Reviews in Ann Arbor. These events brought mathematicians together with other local scientists and with legislators at the national level to discuss the importance of supporting research in science and mathematics. If individuals were to organize such events with other members of their local universities, it could really have a big impact. The AMS is working on developing materials to assist those who would like to do so.

Here is another example. In June of last year, three scientists and three mathematicians went to Washington to talk about the role of basic research with Representative John Porter [R-IL] and Senator Bill Frist [R-TN]. The scientists I took were David Mumford, Edward Witten, and William lipscomb, a Nobel Prize winner in chemistry. The meeting was set up by the AMS and organized by Sam Rankin, director of the AMS Washington Office. We had a very good meeting with Representative Porter, and we saw him for half an hour as scheduled. We also had a half-hour appointment to speak with Senator Frist, but he ended up spending two or two and a half hours with us. In the end we had an opportunity to help Frist in rewriting parts of an important bill pertaining to science funding. This bill, the Federal Research Investment Act, is cosponsored by Senator John D. Rockefeller [D-WV]. It passed the Senate unanimously on a voice vote in October 1998, and it will be considered in the House of Representatives in 1999.

Part of this bill pertains to the Government Performance and Results Act [GPRA]. GPRA mandates that all federal departments and agencies must set forth specific goals, together with time lines for achieving them and ways of measuring whether the goals have been achieved. While justification of performance mandated by this bill across all of government has many virtues, its application to basic research poses many difficulties, because it has the potential to drive all agencies toward quite short-term goals. Senator Frist is very concerned about this. One part of his bill directed the Office of Management and Budget and the Office of Science and Technology Policy to commission a study by the National Academy of Sciences to come up with a way to devise metrics to decide whether research is successful. Now this study has become part of the appropriations bill for the National Science Foundation. This study must be performed extraordinarily thoughtfully and well. I believe that different metrics need to be developed for long-term research in order to judge its success differently from the way we view more immediate, directed projects. We have to think this through carefully, for if the scientific community puts its stamp of approval on an ill-devised plan, then we will be in a worse situation than before. This brings the responsibility for the framing of metrics back from the government and places it in the scientific community, where the process belongs.

Notices: Could you describe what serendipity went into being able to meet with someone like Senator Frist?
Jaffe: This is an excellent example of how apparently unrelated incidents led to our contributing to key legislation. Our June meeting culminated a year during which we worked together with members of Frist's staff on other questions. We first met these staff members, Tom Wood and Elizabeth Prostic, through staff members of Sen­

ator Joseph Lieberman [D-CT]. In helping one senator's office to set up a roundtable on education, we became acquainted with staff in the other office; both senators are members of the science caucus. Eventually, after some other meetings, Elizabeth Prostic helped us to ensure a private meeting with Frist. This is just one example of many things that we have done in Washington where chance meetings of one sort led to unexpected contacts of another sort.

Notices: Will you continue these kinds of activities in Washington after your term as AMS president ends?

Jaffe: The next president will have his own agenda. But Felix Browder and I see eye to eye on many matters, so I expect to remain active through the Committee on Science Policy.

Notices: Are there some matters that you feel are important that you were not able to address during your presidency?

Jaffe: There are many things. No AMS president can focus on more than a couple of important issues, and there are many such issues throughout mathematics. One example is the future of electronic publishing. It is extremely important for the future of mathematics to ensure that the transition to electronic publishing is handled well. Of course, the AMS is at the present time a leading player in electronic publishing, especially with MathSciNet and the electronic journals it publishes. We would like to stay at the forefront.

Another central issue is how mathematics is funded—not just how big the budgets are, but how mathematics is viewed by agencies. The relation between research and education is also a key issue. These things will be discussed and framed for years to come.

Mathematics has to attract the brightest young people in the country, as should being a mathematician. We need to address the job problem. A small step to simplify procedures is under discussion at the moment, to attempt to agree on a common initial date of acceptance of first job offers.1 Another problem in the job market is the lack of long-range consistency in supporting good research. Having consistency and tradition is extremely important in ensuring that there is a flow of excellent people who decide that they are going to spend their lives in mathematics.

Another important and unresolved question revolves around discussions on how to make Society membership more meaningful to the community. I have appointed a Task Force on Membership, chaired by Salah Baouendi, to look into this question and to make recommendations. The Task Force is collecting data and will work together with the AMS staff. Persons with ideas can transmit them directly to Salah or to Jim Maxwell at the Providence headquarters. The Task Force is only beginning to work, so its recommendations will probably wait for their discussion and implementation until Felix is president.

Notices: As president you have devoted a lot of time to making individual personal contacts. And yet the structure of the AMS, with its large number of committees and with the Council comprising about forty members, does not facilitate that kind of approach. Do you think a change is needed in the structure of the AMS?

Jaffe: It's important that there are different ways for members to be involved in the AMS. However, I do think the AMS has too many committees; we have over one hundred. I am responsible for many of these appointments, and by virtue of being president I serve on something like fourteen committees and chair six. I find this structure unwieldy, and it certainly wastes time. But there were two reasons that I made a conscious decision not to try to make any changes in this realm. The committee structure of the AMS had just been reformed by the Council, so it was too soon to look at it again. Also, dealing with the committee structure would be another full-time project, and that wasn't where I wanted to put my energy.

The major change in the structure of the AMS in recent years was the formation of the five policy committees: the Committee on Science Policy, the Committee on Education, the Committee on Publications, the Committee on Meetings and Conferences, and the Committee on the Profession. There are some problems with the policy committees, but I think they are working much better now than when I began as president—they've had some time to understand how to work and what their roles are. Clearly, on certain policy committees there is tension between the committee's charge and what decisions are made in Providence by the AMS staff. There are complicated questions, and I am not sure they were thought through with sufficient care when the policy committees were set up.

Notices: Do you have any advice for your successor, Felix Browder?

Jaffe: My only advice for Felix is to focus on a few issues. I was preceded by a distinguished president, Cathleen Morawetz, and I will be followed by another. He will ensure that the AMS continues to play a meaningful role for the mathematics community.

1998 Annual Survey of the Mathematical Sciences

(First Report)

Faculty Salary Survey

Paul W. Davis, James W. Maxwell, and Kinda M. Remick

This first report on the 1998 Survey includes information about the employment of 1997-98 new doctoral recipients and salary data on faculty members in four-year colleges and universities. The report is based on information collected from questionnaires distributed in May to departments in the mathematical sciences in colleges and universities in the United States. A further questionnaire concerned with data on fall enrollments, majors, and departmental size was distributed in September. These data will appear in the Second Report of the 1998 Annual Survey in a summer 1999 issue of the Notices.

The 1998 Annual Survey represents the forty-second in an annual series begun in 1957 by the Society. The 1998 Survey is under the direction of the Annual Survey Data Committee, whose members are Paul W. Davis (chair), Lorraine Denby, Malay Ghosh, Mary W. Gray, Alfred W. Hales, Don O. Loftsgaarden, James W. Maxwell (ex officio), M. Beth Ruskai, Ann K. Stehney, and Ann E. Watkins. The committee is assisted by AMS Survey Specialist Kinda Remick. Comments or suggestions regarding this Survey Report may be directed to the Committee.

This report presents a statistical profile of recipients of doctoral degrees awarded by departments in the mathematical sciences at universities in the United States during the period July 1, 1997, through June 30, 1998. It includes a preliminary analysis of the employment market for 1997-98 doctoral recipients and a demographic profile summarizing characteristics of citizenship status, gender, and racial/ethnic group. Table 1 provides the response rates for the 1998 Survey of New Doctoral Recipients. Please see page 231 for a description of the groups, newly defined for the 1996 Survey.

Revised Procedure for Survey of Employment Status
In the years prior to 1997, the Data Committee determined the employment status of doctoral recipients in two stages: departments were asked in May about the employment status of that year's doctoral recipients (using the Doctorates Granted form), and the individual recipients themselves were polled during the summer (using the Salaries and Professional Experience or SAPE form). Obviously, the employment information obtained from individuals is more accurate than the preliminary data obtained from departments, and it is the department data updated by the SAPE form that has been presented in previous First Reports from the Committee.

Beginning with last year, the summer sampling of individual degree recipients using the SAPE form was replaced by a fall mailing using an instrument known as Employment Experiences of New Doctoral Recipients. This new procedure gathers additional information and permit comparisons with employment patterns in other disciplines, but its timing prevents having the more accurate employment data from individuals available for the Committee's First Report.

The employment data contained in this report is comparable to last year's data but not to data presented in reports prior to 1997. The Committee's Second Report, which will appear in a future issue of Notices, will present employment data comparable with those prior reports by virtue of its incorporation of responses from individual degree recipients.

Table 1: Response Rates

</table>
Since sex, race/ethnicity, and citizenship reported by departments are not changed significantly by the individual SAPE forms, those data in this report can reasonably be compared with past reports from the Committee.

**Doctoral Degrees Granted**

The number of new doctoral recipients reported in 1997-98 by U.S. mathematical sciences departments is 1,216. Table 2A gives the fall and final counts for the past four Annual Surveys together with the current fall count. This year's fall count will be updated in the Second Report of the 1998 Annual Survey, to appear in a summer 1999 issue of Notices.

The 1998 fall count of the total number of new doctoral recipients of 1,216 represents an increase from the 1997 fall count of 1,158, and it is the highest number in three years.

*To appear in a summer 1999 issue of Notices.*

Table 2B records the annual number of new doctoral recipients in the mathematical sciences in the U.S. from the year 1993-94, exclusive of Group Va. The response rate for Group Va, which includes some departments in engineering and management science, is the lowest of all groups.

**Table 2B: New Doctoral Degrees Awarded by Groups I-Va, Fall Count**

</tbody>
</table>

The columns in Table 3B indicate how the count of 1,216 new doctoral recipients was spread over the mathematical sciences departments in Groups I-V. For mathematics departments (Groups I, II, and III combined), there was an increase of 2.2% in the fall count of new doctoral recipients over the previous year.

**Employment Status of U.S. New Doctoral Recipients, 1997-98**

The Annual Survey of New Doctoral Recipients provides a view of the employment market for new Ph.D.s in the mathematical sciences from the perspective of job applicants. Additional information about recruitment by four-year colleges and universities is reported in the Second Report of the Annual Survey; see the 1997 Second Report, Notices, October 1998, pages 1158-1171, for data on the numbers of positions departments attempted to fill and characteristics of the people hired for fall 1997.

As described in "Revised Procedure of Survey of Employment Status" at the beginning of this report, the employment information provided by departments on their doctoral recipients is updated and expanded by questionnaires sent to each doctoral recipient. In years prior to 1997 these forms were mailed out at the beginning of June, and early returns of these questionnaires were incorporated into the data that was analyzed.

Paul W. Davis is professor of mathematics at Worcester Polytechnic Institute. James (Jim) W. Maxwell is AMS associate executive director for Professional Programs and Services. Kinda M. Remick is AMS survey specialist.

lyzed and reported in the First Report. Starting with the 1997 Annual Survey, the mailing to individual doctoral recipients took place in October. Hence, the 1998 figures on employment reported here do not reflect updated information from individuals, and they may not be strictly comparable with those of Annual Surveys prior to 1997.

Table 3A shows the employment status, by type of employer and field of degree, of the 1,216 recipients of doctoral degrees conferred by mathematical sciences departments in the U.S. between July 1, 1997, and June 30, 1998. The names of the individuals are listed with their thesis titles in this issue of Notices (pages 246–265).

Table 3A shows that among those whose employment status is known, 7.2% are unemployed. The corresponding rate of unemployment from 1996–97 is approximately 6.8%. After adjustment for comparability with current statistics, the unemployment rate for 1995–96, the last year of the old survey scheme, is approximately 10.1%. An update of Table 3A, incorporating the results of the follow-up questionnaire to individual recipients, will appear in the 1998 Second Report in a summer 1999 issue of Notices.

Beyond the unemployment statistics that are explicitly reported in Tables 3A, 3B, and 3C, the 1998 Survey provides other indicators about the job market. For example, 17 (1.7%) new doctoral recipients are reported to hold part-time positions, and 58 (5.7%) new doctoral recipients hold employment at the same institution that awarded their degree, although not necessarily in the same department in which the degree was earned. To compare with the corresponding statistics in 1997, 31 positions (3.3%) were part-time and 71 (7.5%) were held by doctoral recipients in the same institutions where they earned their doctoral degrees.

Most new doctoral recipients seek and accept academic positions. Of the 801 new doctoral recipients employed in the U.S., a total of 517 (64.5%) hold jobs in academia (including research institutes). For comparison, last year's data showed 731 new doctoral recipients employed in the U.S., including 467 (63.9%) in academic positions. Thus, total U.S. employment of new doctoral recipients has increased by 9.6%, and the percentage of positions in academia increased by 10.7%. Concomitantly, the fraction of nonacademic positions in the U.S. taken by new doctoral recipients decreased only slightly from 36.1% to 35.5% of those employed in the U.S., and the total number rose from 264 in 1996–97 to 284 this year.

The 517 U.S. academic positions this year include a total of 223 in U.S. doctoral degree-granting departments (Groups I–V). This number is 5.7% higher than last year's count (211 positions in Groups I–V). The number of new doctoral recipients employed by master's and bachelor's degree-granting colleges and universities (Groups M and B) increased by 18 (11.3%) from the number reported last year. The number of new doctoral recipients hired by research institutes increased by 50.0%, government increased by 37.5%, and business and industry increased by 3.4% from last year.

Employment of the new doctoral recipients by business and industry constitutes 30.0% of all U.S. employment of these new doctoral recipients. Last year 31.7% were hired by business and industry.

Table 3B reveals the dependence of employment patterns on the type of department from which the doctoral degree is received. New doctoral recipients hired for positions in doctoral degree-granting mathematics departments (Groups I, II, III) are drawn predominantly from these same departments: 92.7% of the positions filled in Groups I, II, and III are held by those who received their degrees from Group I, II, or III departments. Similarly, 85.7% of the Group IV jobs held by new doctoral recipients went to Group IV degree recipients. These percentages compare with 95.3% and 93.9% respectively from the 1997 figures.

Women represent 24.4% of the population of new doctoral recipients, down slightly from 24.8% in 1996–97, but the proportion is not uniform across different types of departments. For example, 22.3% of the new doctoral recipients in mathematics (Groups I–II–III) are women (up from 21.9% last year), and 34.3% of the new doctoral recipients from statistics departments are women (down from 37.6% last year). The proportion of women among new doctoral recipients hired by doctoral degree-granting mathematics departments (18.3%) is considerably less than
Table 3D: Percentage of Unemployed New Doctoral Recipients by Granting Department

</tr>
</tbody>
</table>

Table 3D shows different rates of unemployment for doctoral recipients based on the group of their granting department. The percentages unemployed are based on those whose employment status is known. The rates for groups I, II, and IV are roughly comparable with last year. Groups III and V are significantly different, being 4.2% and 12.3%, respectively, in fall 1997.

Table 3E shows the pattern of employment within broad job categories broken down by the citizenship status of the new doctoral recipients. The citizenship status is known for all of the 1,216 new doctoral recipients. For those whose job status is known, the rate of unemployment for non-U.S. citizens is 1.4 percentage points lower than that for U.S. citizens (6.5% for noncitizens and 7.9% for citizens). Nevertheless, the unemployment rate for U.S. citizens is 0.5 percentage points below the level of last year's data. The percentage of U.S. citizens in U.S. nonacademic jobs is higher than the percentage of noncitizens in the same category (29.6% of citizens versus 25.8% of noncitizens). While the former figure went up by 6.6 percentage points, the latter figure dropped by 6.8 percentage points. The percentage of U.S. citizen degree recipients holding positions in U.S. doctoral degree-granting departments (19.5%) is lower than the percentage for non-U.S. citizens (24.0%). U.S. citizen graduates hold positions in nondoctoral-degree granting U.S. departments in substantially higher proportion than do noncitizens (35.4% of citizens compared to 15.9% of noncitizens). All percentages exclude new doctoral recipients whose job status is unknown.

Of the temporary residents who received doctorates this year, 50.6% obtained U.S. employment, while 77.6% of the permanent residents found U.S. employment, compared with 49.9% and 64.0% respectively last year.

Table 4 presents a breakdown according to gender, ethnic group, and citizenship of the new doctoral recipients. The information reported in this table was obtained in summary form from the departments granting the degrees.

The citizenship status is known for all of the 1,216 new doctoral recipients, including 586 U.S. citizens. The number of U.S. citizen new doctoral recipients is 13.6% more than the 1996-97 figure of 516. Table 5 shows the changes from year to year in the numbers and proportions of U.S. citizens.

The percentage of U.S. citizens among the new doctoral recipients is 48.2%, an increase from last year's percentage of 44.3%. A total of 630 noncitizens were awarded doctoral degrees by U.S. institutions in 1997-98. This represents a decrease of 12 individuals (1.9%) from last year's count of 642. The 1997-98 count is 73.6% greater than the number awarded by U.S. institutions ten years ago (363 in 1987-88).

Among the U.S. citizens receiving doctoral degrees in the mathematical sciences, 11 are Black or African American (6 men and 5 women) and 14 are Hispanic or Latino (8 men and 6

* Column totals are rounded to the nearest whole percent.
women). The former increased by 2 individuals from last year, while the latter remained the same.

Women account for 27.8% of the U.S. citizens receiving doctoral degrees in the mathematical sciences from U.S. universities. This is only slightly lower than last year’s figure of 28.7, the highest percentage ever reported. In addition, the total number of U.S. citizen women who were 1997–98 doctoral recipients (163) increased by 10.1% from last year’s reported 148 and is now the highest number ever reported by the Annual Survey (see Table 6).

Note that in Tables 5 and 6 all years prior to 1982–83 include doctoral recipients from computer science departments.

Acknowledgments
The Annual Survey attempts to provide an accurate appraisal and analysis of various aspects of the academic mathematical sciences scene for the use and benefit of the community and for filling the information needs of the professional organizations. Every year, college and university departments in the United States are invited to respond. The Annual Survey relies heavily on the conscientious efforts of the dedicated staff members of these departments for their cooperation and assistance in responding to the survey questionnaires.

Salary Survey for Faculty

The charts on the following pages display faculty salary data for Groups I Public, I Private, II, III, IV, Va, M, and B: faculty salary distribution by rank, mean salaries by rank, information on quartiles by rank, and the number of usable returns for the group. Since groupings used for the mathematics departments in this year's report differ from years prior to 1995-96, comparisons are possible only to the last two years' data. In addition, Group Va is reported separately this year. Group Vb departments have been dropped from the salary survey due to extremely low response rates. Departments were asked to report the number of tenured and tenure-track faculty whose 1998-99 academic-year salaries fell within given salary intervals. Reporting salary data in this fashion eliminates some of the concerns about confidentiality but does not permit determination of actual quartiles. What can be determined is the salary interval in which the quartiles occur; the salary intervals containing the quartiles are denoted by <n, n+5>.

Reclassification of Departments

As has been the case for a number of years, much of the data in these reports is presented for departments divided into groups according to several characteristics, the principal one being the highest degree offered in the mathematical sciences. Doctorate-granting departments of mathematics are further subdivided according to their ranking of "scholarly quality of program faculty" as reported in the 1995 publication Research-Doctorate Programs in the United States: Continuity and Change.¹ These rankings update those reported in a previous study published in 1982.² Consequently, the departments which now comprise Groups I, II, and III differ significantly from those used prior to the 1996 Survey.

The subdivision of the Group I institutions into Group I Public and Group I Private was new for the 1996 survey. With the increase in the number of the Group I departments from 39 to 48, the Annual Survey Data Committee judged that a further subdivision of public to private would provide more meaningful reporting of the data for these departments.

Brief descriptions of the groupings used for reporting purposes are as follows:

Group I is composed of 48 departments with scores in the 3.00-5.00 range.
Group I Public and Group I Private are Group I departments at public institutions and private institutions respectively.
Group II is composed of 56 departments with scores in the 2.00-2.99 range.
Group III contains the remaining U.S. departments reporting a doctoral program, including a number of departments not included in the 1995 ranking of program faculty.
Group IV contains U.S. departments (or programs) of statistics, biostatistics, and biometrics reporting a doctoral program.
Group V contains U.S. departments (or programs) in applied mathematics/applied science, operations research, and management science which report a doctoral program.
Group Va is applied mathematics/applied science; Group Vb is operations research and management science.
Group M contains U.S. departments granting a master's degree as the highest graduate degree.
Group B contains U.S. departments granting a baccalaureate degree only.

Listings of the actual departments which comprise these groups are available on the AMS Website at www.ams.org/employment/.

²These findings were published in An Assessment of Research-Doctorate Programs in the United States: Mathematical and Physical Sciences, edited by Iyle V. Jones, Gardner Lindzey, and Porter E. Coggeshall; National Academy Press; Washington, DC; 1982. The information on mathematics, statistics, and computer science was presented in digest form in the April 1983 issue of the Notices, pages 257-67, and an analysis of the classifications was given in the June 1983 Notices, pages 392-3.

ERA-AMS publishes high-quality research announcements of significant advances in all branches of mathematics. Authors may submit manuscripts to any editor. All papers are reviewed, and the entire Editorial Board must approve the acceptance of any paper. Papers are posted as soon as they are accepted and processed by the AMS.

ERA-AMS offers you ...
- decreased turn-around time from submission to print
- fast access to your specific area of interest
- up-to-the-minute research information

To obtain submission information and the template, send email to: era-info@ams.org with the word "help" in the subject line.

For more information, contact: cust-serv@ams.org

AAAS Fellows Elected

Four mathematicians have been elected as Fellows of Section A, the mathematics section, of the American Association for the Advancement of Science. The new fellows are JERRY L. BONA, University of Texas, Austin; KEITH DEVLIN, St. Mary's College; DEBORAH HUGHES HALL, Harvard University; and JAMES A. YORKE, University of Maryland.

—From an AAAS announcement

Putnam Prizes Awarded

The winners of the 58th William Lowell Putnam Competition have been announced. The Putnam Competition is administered by the Mathematical Association of America and consists of an examination containing mathematical problems that are designed to test both originality and technical competence. Prizes are awarded to both individuals and teams.

The six highest ranking individuals, listed in alphabetical order, were PATRICK K. CORN, Harvard University; MIKE L. DEVELIN, Harvard University; SAMUEL GRUSHEVSKY, Harvard University; CIPRIAN MANOLESCU, Harvard University; OVIDIU SAVIN, University of Pittsburgh; and DANIEL K. SCHEPLER, Washington University, St. Louis.

IOANA DUMITRIU of New York University was awarded the Elizabeth Lowell Putnam Prize, which is given to the woman who turns in the most outstanding performance in the Competition. Dumitriu also won the Elizabeth Lowell Putnam Prize in the 57th Competition, in which she was the first woman ever to place among the six highest-scoring individuals. The Elizabeth Lowell Putnam Prize carries a cash award of $1,000.

Institutions with at least three registered participants obtain a team ranking in the Competition based on the rankings of three designated individual participants. The five top-ranked teams (with team members listed in alphabetical order) were: Harvard University (Samuel Grushevsky, Dragos N. Oprea, Stephen S. Wang); Duke University (Jonathan G. Curtis, Andrew O. Dittmer, Noam M. Shazeer); Princeton University (Craig R. Helfgott, Michael R. Korn, Alexandru-Anton A. M. Popa); Massachusetts Institute of Technology (Federico Ardila, Constantin S. Chiscanu, Amit Khetan); and Washington University, St. Louis (Daniel B. Johnston, Daniel K. Schepler, Arun K. Sharma).

The top five individuals in the Competition received cash awards of $2,500; the next ten received $1,000. The first-place team was awarded $25,000, with each team member receiving $1,000. The team awards for second place were $20,000 and $800; for third place, $15,000 and $600; for fourth place, $10,000 and $400; and for fifth place, $5,000 and $200.

—Elaine Kehoe

Pi Mu Epsilon Awards Student Prizes

The AMS sponsors an annual prize that is awarded by Pi Mu Epsilon, the national honorary mathematics society. The prize was initiated in 1989 in honor of PI's seventy-fifth anniversary. PME administers the prize and uses it to recognize the best student papers presented at a PME student paper session. Each recipient of the AMS Award for Outstanding Pi Mu Epsilon Student Paper Presentation receives a check for $150. Following is a list of the recipients of the awards that were made at the 1998 Pi Mu Epsilon meeting, held last July in Toronto, Canada.

The winning speakers were STEPHEN BOCHANSKI, St. Joseph's University; JOE FERGUSON, Youngstown State University; NATHAN L. GIBSON, Worcester Polytechnic Institute; STEPHEN HARTKE, University of Dayton; KIMBALL MARTIN, University of Maryland, Baltimore County; TING FAI NG, University of Pennsylvania; JOHN SLANINA, Youngstown State University; and HARRY SMITH, St. Joseph's University.
Mathematics People

The winners each received a prize of $150. Bochanski and Smith, who coauthored their paper, shared the $150 award.

—From a Pi Mu Epsilon announcement

NRC-Ford Foundation Minority Fellowships Awarded

Four mathematicians have been awarded Ford Foundation Minority Fellowships for 1998. The fellowship programs are administered by the National Research Council for the purpose of increasing the presence of underrepresented groups among faculty members in colleges and universities.

The recipients of 1998 Predoctoral Fellowships are SHARON ANGELA NEWMAN-GOMEZ, University of California, Riverside; JOHN ANTHONY PÉREZ, Brown University; and FRANCISCO RAMÓN RÍOS, University of California, Berkeley. The Predoctoral Fellowship program provides students of demonstrated ability with the opportunity to engage in advanced study leading to the Ph.D. or Sc.D. degree in research-based doctoral programs.

DAVID VICENTE CRUZ-URIBE of Trinity College was chosen as a 1998 Postdoctoral Fellow. This fellowship allows teacher-scholars the opportunity for research and scholarship free from the interference of their professional duties.

The award winners were selected from a field of about 1,000 applicants, based on merit and promise of future achievement. More information about the fellowship programs is available on the World Wide Web at http://fellowships.nas.edu/

—From a National Research Council announcement

Deaths

WALTER BERNARD, of Providence, RI, died on August 31, 1998. He was a member of the Society for 7 years.

GABRIEL FONTIER, professor emeritus at Queens College, CUNY, died on August 5, 1998. Born on November 21, 1918, he was a member of the Society for 6 years.

JEAN LÉRAY, professor emeritus at the Collège de France, died on November 10, 1998. Born on November 7, 1906, he was a member of the Society for 47 years.

RALPH S. PHILLIPS, Robert Grimmett Professor Emeritus at Stanford University, died on November 23, 1998. Born on June 23, 1913, he was a member of the Society for 61 years.

THOMAS H. SLOOK, professor emeritus at Temple University, died on October 9, 1998. Born on October 6, 1919, he was a member of the Society for 50 years.
Mathematics Opportunities

Conference Announcement

The Summer Mathematics Experience: A Working Conference on Summer Mathematics Programs for Undergraduates, organized by the AMS and funded by the National Security Agency, will take place Thursday, September 30, 1999-Sunday, October 3, 1999, in the Washington, DC, area.

The goals of the conference include: identifying best practices in summer programs for undergraduates, building a network of faculty who work on such programs, using these programs to increase the number of mathematicians from historically underrepresented groups, and identifying successful assessment techniques for such programs. The AMS will publish a conference proceedings.

The majority of conference participants will be invited by the AMS because of their experience in designing and running undergraduate summer programs. In addition to these participants, the conference organizing committee invites faculty who have an interest in and history of working with undergraduates in summer mathematics programs or who have worked with undergraduates on research projects outside the classroom to apply to participate in the conference.

To apply, please submit:
1. A statement of interest (200-500 words) that describes your experience with undergraduate summer mathematics programs and how you might contribute to the success of the conference.
2. A curriculum vitae.

Applications should be sent to: Dr. James Maxwell, Professional Programs and Services, American Mathematical Society, P. O. Box 6248, Providence, RI 02940-6248. Applications must be postmarked by March 15, 1999. Applicants will be notified of acceptance or not by April 15, 1999. For more information please contact the conference organizing committee: Joseph A. Gallian (jgallian@d.umn.edu, 218-726-7576), Herbert A. Medina (hmedina@popmail.lmu.edu, 310-338-5113), and Deborah Nolan (nolan@stat.berkeley.edu, 510-643-7097).

1999 NSF-CBMS Regional Conferences

With funding from the National Science Foundation (NSF), the Conference Board of the Mathematical Sciences (CBMS) will hold five NSF-CBMS Regional Research Conferences during the summer of 1999. These conferences are intended to stimulate interest and activity in mathematical research.

Each five-day conference features a distinguished lecturer who will deliver ten lectures on a topic of importance in current research. Support for about thirty participants will be provided for each conference. Established researchers and interested newcomers, including postdoctoral fellows and graduate students, are invited to attend.

The title of each conference follows, along with the name of the principal speaker, the date and location of the conference, and the names of the organizers, as well as contact information. More information about the conferences can also be found at the Web site http://www.maa.org/cbms/nsf/99nsf.html or by contacting the Conference Board of the Mathematical Sciences, 1529 18th St., NW, Washington, DC 20036-1385; telephone 202-293-1170; fax 202-265-2384; e-mail: kolbe@math.georgetown.edu or rosier@math.georgetown.edu.

Generalized Linear Mixed Models and Related Topics, Charles E. McCulloch, June 8-12, University of Florida. Organizer: James G. Booth. Telephone: 352-392-1941; e-mail:
IAS/Park City Mathematics Institute

The Institute for Advanced Study (IAS)/Park City Mathematics Institute (PCMI) will hold its 1999 summer session from June 20–July 10, 1999. The topic is arithmetic algebraic geometry, and the organizers are Karl Rubin (Stanford University) and Brian Conrad (Harvard University).

The IAS/PCMI began in 1991 at the University of Utah as a National Science Foundation Regional Geometry Institute. In 1993 the Institute for Advanced Study assumed sponsorship of the program. Each summer the Institute offers an integrated set of programs for researchers, postdoctorates, graduate and undergraduate students, and teachers. The Institute also sponsors a Mentoring Program for Women in Mathematics, organized by Karen Uhlenbeck (University of Texas, Austin) and Chuu-Lian Terng (Northeastern University).

Further information on the Institute and the Mentoring Program for Women, as well as on application procedures, is available at the Web site http://www.admin.ias.edu/ma/park.htm.

—from an IAS/PCMI announcement

Travel Grants for Women in Mathematics

The Association for Women in Mathematics (AWM) is offering grants for women mathematicians to travel to professional conferences in their fields and also to the Olga Taussky Todd Celebration of Careers in Mathematics for Women.

The AWM travel grants program, which is sponsored by the National Science Foundation (NSF), allows women mathematicians to attend research conferences in fields that are supported by the Division of Mathematical Sciences of the NSF. The grants provide full or partial support for travel and subsistence up to a maximum of $1,000 for domestic and $2,000 for foreign travel.

Applicants must be women who have a doctorate or equivalent experience and have a work (or home, if unemployed) address in the United States. The deadline for receipt of applications is February 1, 1999.

Travel grants are also available for women graduate students and recent Ph.D.’s (not yet tenured) to attend the Olga Taussky Todd Celebration, July 16–18, 1999, at the Mathematical Sciences Research Institute (MSRI) in Berkeley, California. Funding is being provided by the National Security Agency (NSA), MSRI, the Office of Naval Research (ONR), and AWM.

The celebration will feature lectures showcasing the research of outstanding women in mathematics and talks by established mathematicians working in government, business, industry, and academia. Applicants who receive travel funds will present their work in a poster session or a talk and will receive reimbursement for travel costs (up to $600) and 2.5 days’ subsistence at $150 per diem for meals and lodging. The deadline to apply for these travel funds is February 18, 1999.
Further information about the Todd Celebration and about travel grants in general, as well as about application procedures, can be obtained on the AWM Web site, http://www.awm-math.org/, by telephone at 301-405-7892, or by e-mail at awm@math.umd.edu.

Prize for Achievement in Information-Based Complexity

This annual prize, given by a group of people interested in the area of information-based complexity, is for outstanding achievement in information-based complexity. It will consist of three thousand dollars ($3,000) and a certificate and will be awarded at a suitable location. The initial prize committee will consist of Joseph F. Traub and Henryk Wozniakowski. Anyone other than current members of the prize committee is eligible. The members of the prize committee would appreciate nominations for the prize. However, a person does not have to be nominated to win the award.

The deadline for the first award is March 31, 1999. The achievement can be based on work done in a single year, over a number of years, or over a lifetime. It can be published in any journal, or in any number of journals, or monographs.

Nominations can be sent to Joseph F. Traub, Computer Science Department, Columbia University, 1214 Amsterdam Avenue, MC0401, New York, NY 10027; e-mail traub@cs.columbia.edu.

—From Joseph F. Traub
For Your Information

Departments Coordinate Job Offer Deadlines

Over sixty Ph.D.-granting mathematics departments in the U.S. have adopted an agreement to coordinate deadlines for responding to postdoctoral job offers.

The agreement attempts to address the problem that sometimes faces candidates for postdoctoral positions when they are asked to respond to a job offer by a certain date and this date is before the date of announcement of the National Science Foundation (NSF) Mathematical Sciences Postdoctoral Fellowships. In order to avoid this problem, the NSF has agreed to announce the names of fellowship recipients earlier, on Friday, January 29, 1999. The departments have agreed not to require responses to job offers before Monday, February 8, 1999.

For further information about the agreement, see the “For Your Information” section of the January 1999 issue of the Notices. As of December 4, sixty-seven departments had signed the agreement. An earlier plan to list in the Notices the departments adhering to the agreement was dropped because the list was continuing to change, and instead an up-to-date list may be found on the AMS Web site at http://www.ams.org/employment/postdoc-offers.html.

—Allyn Jackson

NSF to Sponsor Conference on Doctoral Programs

The National Science Foundation, in conjunction with the University of Missouri, will sponsor a National Conference on Issues Related to Doctoral Programs in Mathematics Education to be held in the fall of 1999. Faculty at institutions offering doctoral programs are invited to contribute information about their programs.

To provide background information for the conference, a survey of faculty at institutions that offer doctoral degrees in mathematics education or an emphasis on mathematics education at any level—elementary, secondary, or collegiate—will be conducted. For those who would like to participate in this survey, a questionnaire will be posted after January 1 at www.showmecenter.missouri.edu/doctoralprograms/.

For further information about the conference, please contact Robert Reys, University of Missouri, 104 Stewart Hall, Columbia, MO 65211; telephone 573-882-3740; e-mail: reysr@missouri.edu; fax 573-882-4481.

—Robert E. Reys, University of Missouri
Reference and Book List

The Reference section of the Notices is intended to provide the reader with frequently sought information in an easily accessible manner. New information is printed as it becomes available and is referenced after the first printing. As soon as information is updated or otherwise changed, it will be noted in this section.

Upcoming Deadlines
February 1, 1999: Deadline for applications for AWM travel grants. For more information, see "Mathematics Opportunities" in this issue.

February 5, 1999: Deadline for receipt of proposals for MAA Grants for Women and Mathematics Projects. For more information, consult the Web site http://www.maa.org/ projects/solic_99.html or contact Bernice Kastner, Mathematical Association of America, 1529 Eighteenth Street, NW, Washington, DC 20036; telephone 800-741-9415; e-mail: bkastner@maa.org.

February 16, 1999: Deadline for proposals for the first VIGRE Grant competition. For more information, consult the NSF Web site at http://www.nsf.gov/cgi-bin/getpub?nsf9916/.

February 18, 1999: Deadline for application for AWM travel grants for the Olga Taussky Todd Celebration of Careers in Mathematics for Women. For details, see "Mathematics Opportunities" in this issue.

February 28, 1999: Deadline for applications for the special minisymposium at the Fourth International Congress on Industrial and Applied Mathematics (ICIAM 99). For more information, see "Mathematics Opportunities" in this issue.

February 28, 1999: Deadline for proposals for the 2001-02 scientific program of the Mittag-Leffler Institute. For more information, consult the Web site http://www.ml.kva.se/proposals.html or contact the director of the Institute, Kjell-Ove Widman, at widman@ml.kva.se.

March 1, 1999: Deadline for applications for Enhancing Diversity in Graduate Education (EDGE), the Bryn Mawr College summer program for women. For details, consult the Web site http://www.brynmawr.edu/Acads/Math/edge.html or contact EDGE Program, Box 270, Spelman College, Atlanta, GA 30314.

March 31, 1999: Deadline for applications for the Mittag-Leffler Insti-

Book List
Readers will find listed here books that have mathematical themes and hold appeal for a wide audience, including mathematicians, students, and a significant portion of the general public. In cases where a book has been reviewed in the Notices, a reference is given to the review. Generally the list will contain only books published within the last two years, though exceptions may be made in cases where current events (e.g., the death of a prominent mathematician, coverage of a certain piece of mathematics in the news) warrant drawing readers' attention to older books. While efforts are made to include as many books as possible, the list is necessarily limited to those books that have come to the attention of the Notices editors and that are deemed appropriate for inclusion in the list. Suggestions for books to include on the list may be sent to the managing editor, e-mail: notices@ams.org.

Visual Explanations—Images and Quantities, Evidence and Narrative, by Edward R. Tufte, Graphics Press,

---

**About the Cover**

A photograph of “Sierpinski Garden”, a painting by Khaldoun Khashanah, research assistant professor at Stevens Institute of Technology (http://attila.stevens-tech.edu/~kkhashan).

The artist writes, “This painting was inspired by the study and teaching of fractals in early 1997 and the beautiful landscapes of Narrowsburg, NY, on the Delaware River. The painting was completely spontaneous, with no intention of artificially invoking fractals. However, when the painting was completed, it looked to me like the construction of the Sierpinski gasket, or carpet; hence the painting is named ‘Sierpinski Garden’ It seems appropriate to dedicate the painting to some of the creators of the mathematical monsters’, Cantor, Sierpinski, von Koch, and Peano.”

The painting itself is oil on canvas, 38” x 48”.

1998 Election Results

In the elections of 1998 the Society elected a vice president, a trustee, five members at large of the Council, two members of the Editorial Boards Committee, and three members of the Nominating Committee. Terms for these positions are three years beginning on 01 February 1999 and ending on 31 January 2002, except for the trustee, whose term is for five years ending on 31 January 2004, and for members elected to the Nominating Committee, who begin serving immediately and whose terms end on 31 December 2001.

Vice President
Elected as the new vice president is James G. Arthur from the University of Toronto, Toronto, Canada.

Trustee
Elected as the new trustee is Linda Keen from Herbert H. Lehman College (CUNY), New York, NY.

Members at Large of the Council
Elected as new members at large of the Council of the Society are
- Haim Brezis from Rutgers University
- Robert Fefferman from the University of Chicago
- Donald G. Saari from Northwestern University
- Tatiana Toro from the University of Washington
- Nolan R. Wallach from the University of California, San Diego

Editorial Boards Committee
Elected as new members of the Editorial Boards Committee are
- George E. Andrews from Penn State University
- Krystyna Kuperberg from Auburn University

Nominating Committee
Elected as new members of the Nominating Committee are
- William Browder from Princeton University
- Lisa Claire Jeffery from McGill University
- Marc A. Rieffel from the University of California, Berkeley

Members approved two amendments to the bylaws. A few years ago the Society's agreement with the publisher of the American Journal of Mathematics was terminated. It was therefore necessary to remove mention of the editors of that journal in the governance structure of the Society.

In order to bring the titles of officers into conformance with standard English usage, an amendment was approved to change the way titles are mentioned in the bylaws. At the same time the title of ex-president was changed to immediate past president.

Suggestions for elections to be held in the fall of 1999 are solicited by the 1999 Nominating Committee. The Nominating Committee will be meeting during the Annual Meeting in San Antonio in January. Positions to be filled in the 1999 election are: president-elect, vice president, trustee, and five members at large of the Council.

Suggestions for nominations for election for two positions on the Editorial Boards Committee and three positions on the 2000 Nominating Committee are also welcome and can be sent to the secretary.
There will be a number of contested seats in the 1999 AMS Elections. Your suggestions are wanted by:

The Nominating Committee
for president-elect, vice president, trustee, and five members at large of the council

and by

The President
for three Nominating Committee members and two Editorial Boards Committee members.

In addition

The Editorial Boards Committee
requests suggestions for appointments to various editorial boards of Society publications.

Send your suggestions for any of the above to:

Robert J. Daverman
American Mathematical Society
Department of Mathematics
University of Tennessee
Knoxville, TN 37996
e-mail: daverman@novell.math.utk.edu
1999 AMS Election

Nominations by Petition

Vice President or
Member at Large

One position of vice president and member of the Council ex officio for a term of three years is to be filled in the election of 1999. The Council intends to nominate at least two candidates, among whom may be candidates nominated by petition as described in the rules and procedures.

Five positions of member at large of the Council for a term of three years are to be filled in the same election. The Council intends to nominate at least ten candidates, among whom may be candidates nominated by petition in the manner described in the rules and procedures.

Petitions are presented to the Council, which, according to Section 2 of Article VII of the bylaws, makes the nominations. The Council of 23 January 1979 stated the intent of the Council of nominating all persons on whose behalf there were valid petitions.

Prior to presentation to the Council, petitions in support of a candidate for the position of vice president or of member at large of the Council must have at least fifty valid signatures and must conform to several rules and operational considerations, which are described below.

Rules and Procedures

Use separate copies of the form for each candidate for vice president, member at large, or member of the Nominating and Editorial Boards Committees.

1. To be considered, petitions must be addressed to Robert J. Daverman, Secretary, P.O. Box 6248, Providence, Rhode Island 02940, and must arrive by 28 February 1999.
2. The name of the candidate must be given as it appears in the Combined Membership List (CML). If the name does not appear in the list, as in the case of a new member or by error, it must be as it appears in the mailing lists, for example on the mailing label of the Notices. If the name does not identify the candidate uniquely, append the member code, which may be obtained from the candidate's mailing label or the Providence office.
3. The petition for a single candidate may consist of several sheets each bearing the statement of the petition, including the name of the position, and signatures. The name of the candidate must be exactly the same on all sheets.
4. On the next page is a sample form for petitions. Copies may be obtained from the secretary; however, petitioners may make and use photocopies or reasonable facsimiles.
5. A signature is valid when it is clearly that of the member whose name and address is given in the left-hand column.
6. The signature may be in the style chosen by the signer. However, the printed name and address will be checked against the Combined Membership List and the mailing lists. No attempt will be made to match variants of names with the form of name in the CML. A name neither in the CML nor on the mailing lists is not that of a member. (Example: The name Robert M. Fossum is that of a member. The name R. Fossum appears not to be.)
7. When a petition meeting these various requirements appears, the secretary will ask the candidate to indicate willingness to be included on the ballot. Petitioners can facilitate the procedure by accompanying the petitions with a signed statement from the candidate giving consent.
The undersigned members of the American Mathematical Society propose the name of

as a candidate for the position of (check one):

☐ Vice President
☐ Member at Large of the Council
☐ Member of the Nominating Committee
☐ Member of the Editorial Boards Committee

Add this Cover Sheet to all of your Academic Job Applications

How to use this form

1. Using the facing page or a photocopy, (or a TeX version which can be downloaded from the e-math "Employment Information" menu, http://www.ams.org/employment/), fill in the answers which apply to all of your academic applications. Make photocopies.

2. As you mail each application, fill in the remaining questions neatly on one cover sheet and include it on top of your application materials.

The Joint Committee on Employment Opportunities has adopted the cover sheet on the facing page as an aid to job applicants and prospective employers. The form is now available on e-math in a TeX format which can be downloaded and edited. The purpose of the cover form is to aid department staff in tracking and responding to each application.

Mathematics Departments in Bachelor's, Master's and Doctorate granting institutions have been contacted and are expecting to receive the form from each applicant, along with any other application materials they require. Obviously, not all departments will utilize the cover form information in the same manner. Please direct all general questions and comments about the form to: emp-info@ams.org or call the Professional Programs and Services Department, AMS, at 800-321-4267 extension 4105.

JCEO Recommendations for Professional Standards in Hiring Practices

The JCEO believes that every applicant is entitled to the courtesy of a prompt and accurate response that provides timely information about his/her status. Specifically, the JCEO urges all institutions to do the following after receiving an application:

(1) Acknowledge receipt of the application—immediately; and
(2) Provide information as to the current status of the application, as soon as possible.

The JCEO recommends a triage-based response, informing the applicant that he/she
(a) is not being considered further;
(b) is not among the top candidates; or
(c) is a strong match for the position.

The selection committee for this prize requests nominations for consideration for the 2000 award. Further information about this prize can be found in the November 1997 Notices, pp. 1350-1353 (also available at http://www.ams.org/general/prizes.html).

Three Leroy P. Steele Prizes are awarded each year in the following categories: (1) the Steele Prize for Lifetime Achievement: for the cumulative influence of the total mathematical work of the recipient, high level of research over a period of time, particular influence on the development of a field, and influence on mathematics through Ph.D. students; (2) the Steele Prize for Mathematical Exposition: for a book or substantial survey or expository-research paper; and (3) the Steele Prize for Seminal Contributions to Research: for a paper, whether recent or not, that has proved to be of fundamental or lasting importance in its field, or a model of important research.

Nominations with supporting information should be submitted to the Secretary, Robert J. Daverman, Department of Mathematics, University of Tennessee, Knoxville, TN 37996. Include a short description on the work that is the basis of the nomination, including complete biographic citations. A curriculum vitae should be included. The nominations will be forwarded by the Secretary to the prize selection committee, which will, as in the past, make final decisions on the awarding of prizes.

Deadline for nominations is March 31, 1999.
The prize is awarded each year to an undergraduate student (or students having submitted joint work) for outstanding research in mathematics. Any student who is an undergraduate in a college or university in the United States or its possessions, or Canada or Mexico, is eligible to be considered for this prize.

The prize recipient's research need not be confined to a single paper; it may be contained in several papers. However, the paper (or papers) to be considered for the prize must be submitted while the student is an undergraduate; they cannot be submitted after the student's graduation. The research paper (or papers) may be submitted for consideration by the student or a nominator. All submissions for the prize must include at least one letter of support from a person, usually a faculty member, familiar with the student's research. Publication of research is not required.

The recipients of the prize are to be selected by a standing joint committee of the AMS, MAA, and SIAM. The decisions of this committee are final. The 1999 prize will be awarded for papers submitted for consideration no later than June 30, 1999, by (or on behalf of) students who were undergraduates in December 1998.

Nominations and submissions should be sent to:
Morgan Prize Committee

The efficient computation of Fourier transforms on the symmetric group

David K. Maslen

Abstract. This paper introduces new techniques for the efficient computation of Fourier transforms on symmetric groups and their homogeneous spaces. We replace the matrix multiplications in Clavin's algorithm with sums indexed by combinatorial objects that generalize Young tableaux, and write the result in a form similar to Hsencr's rule. The algorithm we obtain computes the Fourier transform on a function \( f \) in no more than \( \lfloor n(n-1)/2 \rfloor \) matrix multiplications and the same number of additions. Analysis of our algorithm leads to several combinatorial problems that generalize path counting. We prove corresponding results for inverse transforms and transforms on homogeneous spaces.

Mathematics Calendar

The most comprehensive and up-to-date Mathematics Calendar information is available on e-MATH at http://www.ams.org/mathcal/.

February 1999

* 25-27 Second New Mexico Analysis Seminar, University of New Mexico, Albuquerque, New Mexico.

Main Lecturer: G. Pisier (Texas A&M, Univ. Paris VI), Similarity problems and the generation of operator algebras with bounded length.

Aim: This is the second conference organized jointly by The University of New Mexico (UNM) and New Mexico State University (NMSU), to provide an opportunity for scientific exchange and cooperation among broadly defined analysts in the Southwest region. The conference centerpiece is a series of one-hour lectures given by a keynote speaker. There is also time allocated for shorter contributed talks. If you would like to attend and/or give a talk, please respond by January 31 so that arrangements can be made. We will try to cover accommodation for graduate students.

Organizers: J. Alvarez, jalvarez@nmsu.edu; J. Lakey, jlakey@nmsu.edu; V. Kolotkin-skii, vlud@math.unm.edu; C. Pereyra, criasp@math.unm.edu.

Information: Contact C. Pereyra, criasp@math.unm.edu.

March 1999

* 16-18 German-American Academic Council Lectures on Prophet Theory, Lehigh University, Bethlehem, Pennsylvania.

Information: B. K. Ghosh, Department of Mathematics, Lehigh Univ., 14 E. Packer Ave., Bethlehem, PA 18015; tel: 610-758-3722; e-mail: bkg001@lehigh.edu.

April 1999

* 17-18 Riviere-Fabes Symposium on Analysis and PDE, University of Minnesota, Minneapolis, Minnesota.

Main Speakers: J. Bourgain (Institute for Advanced Study), C. Kenig (University of Chicago).

Support: A limited amount of financial support will be available to out-of-town graduate students who participate in the symposium.

Information: School of Mathematics, University of Minnesota, 206 Church Street S.E., 127 Vincent Hall, Minneapolis, MN 55455; tel: 612-625-5591, jodeit@math.umn.edu, or Web page: http://www.math.umn.edu/.

* 18-24 Spring School on Functional Analysis, Paseky nad Jizerou, Czech Republic.

Program Committee: J. Lukas, J. Kolar.

Organized By: Department of Mathematical Analysis, Charles University, Sokolovska 83, Prague, Czech Republic.

Speakers: J. M. F. Castillo (Universidad de Extremadura, Spain), V. Fonf (Ben-Gurion University, Negev, Israel), N. Kalton (Univ. of Missouri, Columbia), I. I. Namikova (Univ. of Washington, Seattle).

Participation: Graduate students and others beginning their mathematical careers are encouraged to participate.

Information: Phone/fax: +420-2-323-3390; e-mail: paseky@karlin.mff.cuni.cz; URL: http://www.karlin.mff.cuni.cz/katedry/ksa/.

May 1999

* 26-30 Great Plains Operator Theory Symposium, Iowa State University, Ames, Iowa.

Aim: To foster interaction of researchers in operator theory/operator algebras and applications.

This section contains announcements of meetings and conferences of interest to some segment of the mathematical public, including ad hoc, local, or regional meetings, and meetings and symposia devoted to specialized topics, as well as announcements of regularly scheduled meetings of national or international mathematical organizations. A complete list of meetings of the Society can be found on the last page of each issue.

An announcement will be published in the Notices if it contains a call for papers and specifies the place, date, subject (when applicable), and the speakers; a second announcement will be published only if there are changes or necessary additional information. Once an announcement has appeared, the event will be briefly noted in every third issue until it has been held and a reference will be given in parentheses to the month, year, and page of the issue in which the complete information appeared. Asterisks (*) mark those announcements containing new or revised information.

In general, announcements of meetings and conferences held in North America carry only the date, title of meeting, place of meeting, names of speakers (or sometimes a general statement on the program), deadlines for abstracts or contributed papers, and source of further information. Meetings held outside the North American area may carry more detailed information. In any case, if there is any application deadline with respect to participation in the meeting, this fact should be noted. All communications on meetings and conferences in the mathematical sciences should be sent to the Editor of the Notices in care of the American Mathematical Society in Providence or electronically to notices@ams.org or mathcal@ams.org.

In order to allow participants to arrange their travel plans, organizers of meetings are urged to submit information for these listings early enough to allow them to appear in more than one issue of the Notices prior to the meeting in question. To achieve this, listings should be received in Providence six months prior to the scheduled date of the meeting.

The complete listing of the Mathematics Calendar will be published only in the September issue of the Notices. The March, June, and December issues will include, along with new announcements, references to any previously announced meetings and conferences occurring within the twelve-month period following the month of those issues. New information about meetings and conferences that will occur later than the twelve-month period will be announced once in full and will not be repeated until the date of the conference or meeting falls within the twelve-month period.

The Mathematics Calendar, as well as Meetings and Conferences of the AMS, is now available electronically through e-MATH on the World Wide Web. To access e-MATH, use the URL: http://e-math.ams.org/ (or http://www.ams.org/). For those with VT100-type terminals or for those without WWW browsing software, connect to e-MATH via Telnet (telnet e-math.ams.org; login and password e-math) and use the lynx option from the main menu.)
June 1999

* 6–19 Second Summer School of Mathematical Biology, Termoli, Italy.

**Subject:** The subject of the school will be mathematical methods applied to the study of cell and molecular biology.

**Goal:** The goal of the school is to offer doctoral students and young postdoctoral researchers a presentation of some mathematical techniques widely used in modelling problems in cell physiology and proliferation, together with a review of a selection of some such problems of contemporary relevance. The target audience is mainly composed of advanced graduate students and post-graduates in the life sciences and in mathematical disciplines (math, applied math, physics, engineering).

**Classes:** Duration of the school is two weeks, including 10 days of classes, Monday through Friday. Each day there will be 8 lecture units of 40 min. by the staff and by invited speakers, practice sessions and lectures contributed by participants.

**Participation:** The number of participants is limited to 60. Interested biological and mathematical researchers, Ph.D. students and postdoctoral fellows are encouraged to apply. While the registration fee is fixed, accommodation costs will be assessed on the basis of effective stay. The foreseen average cost of the school to participants, on the basis of the presently expected funding by institutional sponsors, is of the order of 800 Euro (double room, 15 days, full board and lodging, registration and social programme included). The organizing committee is actively seeking more funding in order to further substantially reduce the cost to participants.

**Scientific Committee:** Z. Agur (Israel), O. Arino (France, President), A. De Gaetano (Italy), M. B. Donati (Italy), A. Gandolfi (Italy), M. Kimmel (USA), M. Mackey (Canada), E. Sanchez (Spain/A), A. Swierniak (Poland), P. Ubezio (Italy).

**Organizing Committee:** O. Arino, A. De Gaetano (managing director), A. Gandolfi, M. Kimmel.

**Main Topics:** Cell biology; Haemopoiensis: Dynamics of haemopoiesis in normal and disease conditions; Structured cell popul-
Mathematics Calendar

(Wuhan Univ.), G. C. Wen (Peking Univ.), G. W. Yang (Hebei Sci. & Tech. Univ.) and Z. Zhao (Beijing Normal Univ.).

Information: For more detailed information, please contact G. C. Wen, Dept. of Math., Peking Univ., Beijing 100871, China; tel: 008610-62755937; fax: 008610-62751801; e-mail: wege@pku.edu.cn.

*15-21 International Conference on Differential and Functional Differential Equations, Moscow, Russia. Organized By: Moscow State Aviation Institute with the cooperation of the Steklov Institute of Mathematics of the Russian Academy of Sciences and Moscow Mathematical Society.

Scientific Program: The scientific program will consist of invited 45-minute lectures and 20-minute communications.

Information: Those who wish to attend the Conference are kindly requested to send the title of their talk, mailing address, e-mail and fax number to: A. L. Skubachevskii, Moscow State Aviation Institute, Russia, 125871, Moscow, Volokolamske shosse, 4; fax: (095) 158 2977; e-mail: skub@skub.

Topics: Over the past few years we have witnessed a strong development of numerical methods for viscoelastic flow simulations, and emphasis is shifting towards confrontation with experimental results, enhanced constitutive modelling, stochastic simulations, molecular modelling and multi-dimensional, time-dependent simulations. A continued evolution along these lines is expected and encouraged for the 1999 International Workshop on Numerical Methods in Viscoelastic Flows.

Registration and Fees: The meeting location is a historic castle in the south of the Netherlands: Hotel Vaalsbroek. Registration cost includes housing, all breakfasts, lunches and dinners (including conference dinner) and a visit to downtown Maasstricht on Friday evening. Registration fees, due before April 1, 1999: single room: Dfl. 1,200; double room: Dfl. 1,100; accompanying person: Dfl. 750. The number of participants is limited, therefore it is critical to respond early. Registration and submission of abstract will be via the Web site.

Information: Further information about the workshop can be found on the Web page: http://www.mate.tue.nl/ or direct http://www.mate.tue.nl/workshop/.

September 1999

*20-24 The 10th Biennial Computational Techniques and Applications Conference and Workshops (CTAC99), Australian National University, Canberra, Australia.

Topics: A conference and workshops on aspects of computational mathematics; scientific, technical, and industrial applications; and high-performance computing.

Invited Speakers: M. Hegland (Australian National University), S. Hirschman (Oak Ridge National Laboratory), J. Lewis (Boeing Corp.), T. Speed (Univ. of California, Berkeley), G. Steven (Univ. of Sydney), A. Watson (Univ. of Dundee).

Public Lecture: J. Dongarra (Univ. of Tennessee and Oak Ridge National Laboratory).

Workshops: Data mining, high performance computing, scientific visualisation and virtual environments.

Information: Further information, including deadlines, registration information, contact information for workshop organizers, etc., is available from the conference Web site: http://www.maths.anu.edu.au/conferences/CTAC99/. This will be updated as further information becomes available.

October 1999

*6-9 New Trends in the Calculus of Variations, Lisbon, Portugal.

Topics: Variational methods in nonlinear elasticity; variational models for material behavior; homogenization and relaxation methods; nonconvex problems; shape optimization; free discontinuity problems.

Program: 30-minute presentations by invited speakers, 15-minute presentations by younger researchers.

Deadline: Applications for financial support of graduate students and postdoc fellows should be submitted before May 30, 1999.

The following new announcements will not be repeated until the criteria in the next to the last paragraph at the bottom of the first page of this section are met.

March 2000

*16-18 Seminar on Stochastic Processes, 2000, The University of Utah, Salt Lake City, Utah.

Information: For further information please contact D. Khoshnevisan, (davar@math.utah.edu) or visit the URL: http://www.math.utah.edu/~davar/sep2000-2.html.
New Publications Offered by the AMS

Algebra and Algebraic Geometry

Selected Works of Ellis Kolchin with Commentary

Hyman Bass, Columbia University, New York, Alexandru Buium, University of New Mexico, Albuquerque, and Phyllis J. Cassidy, Smith College, Northampton, MA, Editors

The work of Joseph Fels Ritt and Ellis Kolchin in differential algebra paved the way for exciting new applications in constructive symbolic computation, differential Galois theory, the model theory of fields, and Diophantine geometry. This volume assembles Kolchin's mathematical papers, contributing solidly to the archive on construction of modern differential algebra. This collection of Kolchin's clear and comprehensive papers—in themselves constituting a history of the subject—is an invaluable aid to the student of differential algebra.

In 1910, Ritt created a theory of algebraic differential equations modeled not on the existing transcendental methods of Lie, but rather on the new algebra being developed by E. Noether and B. van der Waerden. Building on Ritt's foundation, and deeply influenced by Weil and Chevalley, Kolchin opened up Ritt theory to modern algebraic geometry. In so doing, he led differential geometry in a new direction. By creating differential algebraic geometry and the theory of differential algebraic groups, Kolchin provided the foundation for a "new geometry" that has led to both a striking and an original approach to arithmetic algebraic geometry. Intriguing possibilities were introduced for a new language for nonlinear differential equations theory.

The volume includes commentary by A. Borel, M. Singer, and B. Poizat. Also Buium and Cassidy trace the development of Kolchin's ideas, from his important early work on the differential Galois theory to his later groundbreaking results on the theory of differential algebraic geometry and differential algebraic groups. Commentaries are self-contained with numerous examples of various aspects of differential algebra and its applications. Central topics of Kolchin's work are discussed, presenting the history of differential algebra and exploring how his work grew from and transformed the work of Ritt. New directions of differential algebra are illustrated, outlining important current advances. Prerequisite to understanding the text is a background at the beginning graduate level in algebra, specifically commutative algebra, the theory of field extensions, and Galois theory.

This item will also be of interest to those working in differential equations.

Contents: Picard-Vessiot theory of partial differential fields; The notion of dimension in the theory of algebraic differential equations; Part I. The Papers of Ellis Kolchin: On certain ideals of differential polynomials; On the basis theorem for infinite systems of differential polynomials; On the exponents of differential ideals; On the basis theorem for differential systems; Extensions of differential fields. I; Extensions of differential fields. II; Algebraic matrix groups; The Picard-Vessiot theory of homogeneous linear ordinary differential equations; Extensions of differential fields. Commentary: A. Borel, Algebraic groups and Galois theory in the work of Ellis R. Kolchin; M. F. Singer, Direct and inverse problems in differential Galois theory; B. Poizat, Les corps différentielllement clos, compagnons de route de la théorie des modèles; A. Buium and P. J. Cassidy, Differential
Higher Category Theory

Ezra Getzler and Mikhail Kapranov, Northwestern University, Evanston, IL, Editors

This volume presents the proceedings of the workshop on higher category theory and mathematical physics held at Northwestern University. Exciting new developments were presented with the aim of making them better known outside the community of experts. In particular, presentations in the style, "Higher Categories for the Working Mathematician
tm
" were encouraged. The volume is the first to bring together developments in higher category theory with applications. This collection is a valuable introduction to this topic—one that holds great promise for future developments in mathematics.

Contents: J. C. Baez and J. Dolan, Categorification; M. A. Batanin, Computads for finitary monads on globular sets; L. Breen, Braided \( n \)-categories and \( \Sigma \)-structures; J.-L. Brylinski, Categories of vector bundles and Yang-Mills equations; R. Street, The role of Michael Batanin's monoidal globular categories; D. N. Yetter, Braided deformations of monoidal categories and Vassiliev invariants.

Contemporary Mathematics, Volume 230

Trends in the Representation Theory of Finite Dimensional Algebras

Edward L. Green, Virginia Polytechnic Institute and State University, Blacksburg, and Birge Huisgen-Zimmermann, University of California, Santa Barbara, Editors

This refereed collection of research papers and survey articles reflects the interplay of finite-dimensional algebras with other areas (algebraic geometry, homological algebra, and the theory of quantum groups). Current trends are presented from the discussions at the AMS-IMS-SIAM Joint Summer Research Conference at the University of Washington (Seattle).

The volume features several excellent expository articles which will introduce the beginning researcher to cutting-edge topics in representation theory. The book will also provide inspiration to researchers in related areas, as it includes original papers spanning a broad spectrum of representation theory.

Features:
- Work outlining significant progress on long-standing open problems.
Dixmier strata of $G$ into sub-strata and a normalization $f^G(f,x) \in C^0_x(G)$, $x \in G$ of the orbital integrals on $G$ which induce, for all $f \in C^0_x(G)$, a map $x \mapsto f^G(f,x)$ that is locally constant on each of these sub-strata.

Distributed by the AMS in the United States, Canada, and Mexico. Orders from other countries should be sent to the SMF, Maison de la SMF, B.P. 67, 13274 Marseille cedex 09, France, or to Institut Henri Poincaré, 11 rue Pierre et Marie Curie, 75231 Paris cedex 05, France. Members of the SMF receive a 30% discount from list.

Contents: Introduction; Les classes de conjugaison de $G$; Integrales orbitales sur $G$; Normalisation ($C^\infty$) des integrales orbitales sur $G$; Independance lineaire des germes; Caracterisation des Integrales orbitales sur $G$ et theoreme de densite; Bibliographie.

Differential Equations

Symmetries and Conservation Laws for Differential Equations of Mathematical Physics

I. S. Krasil’shchik, Moscow Institute for Municipal Economy, Russia, and A. M. Vinogradov, University of Salerno, Italy, Editors

This book presents developments in the geometric approach to nonlinear partial differential equations (PDEs). The expositions discuss the main features of the approach, and the theory of symmetries and the conservation laws based on it. The book combines rigorous mathematics with concrete examples.

Nontraditional topics, such as the theory of nonlocal symmetries and cohomological theory of conservation laws, are also included.

The volume is largely self-contained and includes detailed motivations, extensive examples and exercises, and careful proofs of all results. Readers interested in learning the basics of applications of symmetry methods to differential equations of mathematical physics will find the text useful. Experts will also find it useful as it gathers many results previously only available in journals.

Contents: Ordinary differential equations; First-order equations; The theory of classical symmetries; Higher symmetries; Conservation laws; Nonlocal symmetries; From symmetries of partial differential equations towards secondary (“quantized”) calculus; Bibliography; Index.

Translations of Mathematical Monographs, Volume 182

New Publications Offered by the AMS

General and Interdisciplinary

Gerd Fischer, University of Dusseldorf, Germany, and Ulf Rehmann, University of Bielefeld, Germany, Editors

A publication of Documenta Mathematica.

Each International Congress brings together mathematicians from all over the world to discuss recent developments in all areas of mathematics. It is one of the most exciting gatherings of mathematicians. The 1998 Congress in Berlin was no exception.

The invited speakers at the ICM have been recognized by their colleagues as important leaders in their fields, with their work representing some of the most significant recent research in mathematics. The twenty-one plenary speakers are asked to address the whole congress on recent results and trends that are shaping mathematics today. All plenary and invited lectures are published in these proceedings.

The announcement of the Fields Medalists and the Nevanlinna Prize Winner is a particular highlight of each International Congress. Volume I of the proceedings includes a short description of their work and the text of the lectures presented by the Medalists and Prize Winner at the Congress. This year, the Fields Medal Committee also paid special tribute to Andrew Wiles for his proof of Fermat’s Last Theorem.

The Proceedings of an International Congress of Mathematicians provides a snapshot of mathematics at a given time. The articles for ICM 98 are guideposts to the significant developments in mathematical research at the end of the millennium.

Contents: Volume I: Plenary One-Hour Invited Lectures:

J. M. Bismut, Local index theory and higher analytic torsion;

C. Deninger, Some analogies between number theory and dynamical systems;

P. Diaconis, From shuffling cards to walking around the building: An introduction to modern Markov chain theory;

G. Gallavotti, Chaotic hypothesis and universal large deviations properties;

W. Hackbusch, From classical numerical mathematics to scientific computing;

H. H. W. Hofer, Dynamics, topology and holomorphic curves;

E. Hrushovski, Geometric model theory;

I. G. Macdonald, Constant term identities, orthogonal polynomials and affine Hecke algebras;

S. Mallat, Applied mathematics meets signal processing;

D. McDuff, Fibrations in symplectic topology;

T. Mīwa, Solvable lattice models and representation theory of quantum affine algebras;

G. Papanicolaou, Mathematical problems in geophysical wave propagation;

G. Pisier, Operator spaces and similarity problems;

P. Sarnak, L-functions;

P. W. Shor, Quantum computing;

K. Sigmund, The population dynamics of conflict and cooperation;

C. Vafa, Geometric physics;

M. Viana, Dynamics: A probabilistic and geometric perspective;

V. Voevodsky, A1-homotopy theory; Appendix: M. Safonov, Estimates near the boundary for solutions of second order parabolic equations;

A. J. Wilkie, c-minimality; Appendix: Volume II: Invited Forty-five Minute Lectures, Section 1-9: Logic, see also

Appendix Vol. I: Algebra; Number theory and arithmetic algebraic geometry; Algebraic geometry; Differential geometry and global analysis; Topology; Lie groups and Lie algebras; Analysis; Ordinary differential equations and dynamical systems; Author index for volumes II, III; Volume III: Invited Forty-five Minute Lectures, Sections 10-19: Partial differential equations, see also Appendix Vol. I; Mathematical physics; Probability and statistics; Combinatorics; Mathematical aspects of computer science; Numerical analysis and scientific computing; Applications; Control theory and optimization; Teaching and popularization of mathematics; History of mathematics; Appendix; Author index for volumes II, III.

December 1998, 2374 pages, Hardcover, 1991 Mathematics Subject Classification: 00, Individual member $105, List $140, Order code PICM/98N
Bestselling Publications Distributed by the AMS

These publications are among the bestsellers distributed by the AMS. They are published by various academic publishers—International Press (Boston), Narosa Publishing House (New Delhi, India), Société Mathématique de France (Paris), and Vieweg Verlag (Wiesbaden, Germany). The AMS maintains distribution rights to the works within and outside the USA. Details are listed with the ordering information.

Quantum Groups and Knot Invariants
Christian Kassel, Marc Rosso, and Vladimir Turaev, CNRS, Strasbourg, France
A publication of Société Mathématique de France.
Distributed by the AMS in the United States, Canada, and Mexico. Orders from other countries should be sent to the SMF, Maison de la SMF, 85, B.P. 133, 13274 Marseille cedex 09, France, or to Institut Henri Poincaré, 11 rue Pierre et Marie Curie, 75231 Paris cedex 05, France. Members of the SMF receive a 50% discount from list.

Panoramas et Synthèses, Number 5; 1997; ISBN 2-86601-155-6; 115 pages; Softcover; Individual member $22, List $24, Order Code PASY592

An Introduction to Measure and Integration
Inder K. Rana, Indian Institute of Technology, Pawai
A publication of Narosa Publishing House.
A good addition to the standard texts on the subject . . . the book is clearly a labour of love. The excellence of detail, the wealth of examples and exercises and the evident delight in discussing variations and counter examples all attest to that . . . highly recommended to serious and demanding students of mathematics.
—Resonance
Distributed by the AMS exclusively in North America and Europe and non-exclusively elsewhere.
1997; ISBN 81-7319-120-4; 380 pages; Hardcover; All AMS members $39, List $49, Order Code IMICB92

Lectures on the Mordell-Weil Theorem
Third Edition
Jean-Pierre Serre, Collège de France, Paris
A publication of Vieweg Verlag.
The AMS is exclusive distributor in North America, and non-exclusive distributor worldwide except in Germany, Switzerland, Austria, and Japan.
Vieweg Aspects of Mathematics, Volume 15; 1997; ISBN 3-528-29999-6; 218 pages; Hardcover; All AMS members $41, List $45, Order Code VWA/S102

Deformations of Galois Representations and Hecke Algebras
J. Tilouine, Université de Paris Nord, Villeneuve, France
A publication of Narosa Publishing House.
Distributed by the AMS exclusively in North America and Europe and non-exclusively elsewhere.
1996; ISBN 81-7319-119-0; 168 pages; Softcover; All AMS members $19, List $24, Order Code DGNS02

ARIZONA

ARIZONA STATE UNIVERSITY

Arizona State University invites applications for a joint senior tenure-track position in the Departments of Mathematics and of Chemical, Bio and Materials Engineering commencing fall 1999. All candidates must have a Ph.D. in mathematics, materials science or engineering, or a related area. Candidates must have an outstanding research record and a proven commitment to excellence and innovation in teaching, appropriate to rank.

Candidates must have expertise in modeling and computation encompassing research in materials science or materials engineering. Candidates should expect to participate fully in cross-disciplinary programs, research, teaching, and professional service and should have an established record of research funding.

The main campus of Arizona State University has approximately 49,000 students and is located in the rapidly growing metropolitan Phoenix area, which provides a wide variety of recreational and cultural opportunities. The Department of Mathematics has 57 full-time faculty, and the Department of Chemical, Bio and Materials Engineering has 26 full-time faculty.

Applicants must send (i) their résumé, which identifies three people who will write letters of recommendation for them if contacted by the committee; (ii) a letter stating they wish to be considered for the position and addressing their research agenda; and (iii) a statement of teaching philosophy to:

Chair, Math/CRME Search Committee
P. O. Box 871804
Arizona State University
Tempe, AZ 85287-1804

Review of applications will begin December 15, 1998, and will continue weekly until the position is filled. AA/EOE.

ARIZONA STATE UNIVERSITY

Arizona State University invites applications for a joint senior position in the Departments of Mathematics and of Electrical Engineering commencing fall 1999. All candidates must have a Ph.D. in mathematics, electrical engineering, or a related area. Candidates must have an outstanding research record and a proven commitment to excellence and innovation in teaching, appropriate to rank.

Candidates must have expertise in the modeling and computation of complex dynamical systems encompassing applications from industry or the life sciences. Preferred research areas are in control and nonlinear dynamics (e.g., for use in areas such as mechanical, biochemical, and electrical systems), nonlinear and spatial-temporal signal processing and data analysis, complex systems. Candidates should expect to participate fully in cross-disciplinary programs, research, teaching, and professional service and should have an established record of research funding.

The main campus of Arizona State University has approximately 49,000 students and is located in the rapidly growing metropolitan Phoenix area, which provides a wide variety of recreational and cultural opportunities. The Department of Mathematics has 57 full-time faculty, and the Department of Electrical Engineering has 40 full-time faculty. Faculty from the Departments of Electrical Engineering and Mathematics are also members of the Systems Science and Engineering Research Center (SSERC). This center has associated with it approximately 100 faculty from various engineering, science, and mathematics disciplines. It sponsors many active collaborations with semiconductor,

Applications must send (i) their résumé, which identifies three people who will write letters of recommendation for them if contacted by the committee; (ii) a letter stating they wish to be considered for the position and addressing their research agenda; and (iii) a statement of teaching philosophy to:
Chair, Math/EE Search Committee
P. O. Box 871804
Arizona State University
Tempe, AZ 85287-1804

Review of applications will begin on December 15, 1998, and will continue weekly until the position is filled. AA/EOE.

CALIFORNIA

UNIVERSITY OF CALIFORNIA
Department of Mathematics
Riverside, CA

Applications are invited for possibly one or more visiting assistant professor positions beginning September 1999, contingent upon available funding. Applicants must show demonstrated or strong promise in research and teaching. The positions are open to applicants from all research areas in mathematics. The teaching load is six quarter-courses per year. Candidates must have received a Ph.D. degree by September 1999.

Applicants should send their curriculum vitae, including publications list, and at least three letters of recommendation to:
Temporary Faculty Search Committee
Department of Mathematics
University of California, Riverside
Riverside, CA 92521-0135

by Friday, February 26, 1999. The University of California, Riverside, is an Affirmative Action/Equal Opportunity Employer.

Inquiries (not applications) can be sent to linda@math.ucr.edu or lterry@ucr.edu.

GEORGIA

GEORGIA SOUTHERN UNIVERSITY
Karl Peace Endowed Chair in Mathematics and Computer Science
Department of Mathematics and Computer Science
Statesboro, GA

The Department of Mathematics and Computer Science at Georgia Southern University invites nominations and applications for the Karl Peace Endowed Chair. Starting date of the position is August 1, 1999. Applicants are expected to have a Ph.D. in mathematics, computer science, statistics, or a closely related field, and credentials that merit appointment at the rank of professor with tenure. We are searching for an individual with distinguished academic credentials, the proven ability to conduct and direct high-quality research, and an established record of attracting research support. Candidates should have the qualifications to provide academic and scientific leadership to a developing department. The successful candidate will be expected to establish a vigorous research program, to have a commitment to excellence in undergraduate and graduate education, and to lead our efforts to establish a cooperative program with industry.

We are particularly interested in an individual whose area of expertise lies in the intersection of mathematics and computer science, but exceptional candidates from all fields of the mathematical sciences will be seriously considered. Among the duties will be program development, fund raising, and preparation of proposals, and involvement with the Center of Applied Mathematical Sciences.

The Department of Mathematics and Computer Science, in the Allen E. Paulson College of Science and Technology, offers programs in mathematics at the baccalaureate and master's levels. Our B.S. in computer science is fully accredited by the Computer Science Accreditation Commission. The Department has five state-of-the-art computer laboratories, as well as a networked computer (UNIX, PC or Mac) in the office of each faculty member. The Department has steadily increased its quantity and quality of scholarship during the past decade in applied mathematics, computer science, and statistics. Our Web pages are at http://www.cs.gasou.edu/.

Georgia Southern University, a unit of the University System of Georgia, is the largest and leading center of higher education in the southern half of Georgia and is third in student enrollment among public universities, serving approximately 14,000 students. As a comprehensive, residential university its mission is strongly centered on the education of undergraduate students. The University offers approximately 150 degree programs at the baccalaureate, master's, and doctoral levels through six colleges. Founded in 1906, Georgia Southern became a regional university in 1990. The 634-acre campus is located in Statesboro, a community of approximately 30,000 residents 56 miles northwest of historic Savannah and 206 miles southeast of Atlanta.

A complete application consists of a letter of application addressing the above qualifications, a curriculum vitae, and five letters of reference. Send application materials to Richard Hathaway, Search Chair, Karl Peace Endowed Chair of Mathematics and Computer Science, P.O. Box 8093, Department of Mathematics and Computer Science, Georgia Southern University, Statesboro, GA 30460-8093. Review of the applications will begin on February 15, 1999.

Georgia Southern is an Equal Opportunity/Affirmative Action Institution. Georgia is an Open Records state. Persons who need reasonable accommodations in order to participate in the application process should notify the search chair.
INDIANA

INDIANA UNIVERSITY-PURDUE UNIVERSITY, INDIANAPOLIS
Indianapolis, IN

The Department of Mathematical Sciences has a tenure-track assistant professor position in statistics to begin August 1999. The Department has a growing graduate program in statistics and offers a competitive salary and excellent benefits. A Ph.D. in statistics or a related area, strong research potential, and a commitment to excellence in teaching are required. A letter of application, résumé, and three letters of recommendation should be sent to Robert Kleyle, Department of Mathematical Sciences, Indiana University-Purdue University, Indianapolis, 402 N. Blackford St., Indianapolis, IN 46202. Review of applications will begin 1/15/99 and will continue until the position is filled. Women and minorities are encouraged to apply. AA/EOE.

PURDUE UNIVERSITY CALUMET
School of Engineering, Mathematics and Sciences

Applications and nominations are invited for the position of department of Engineering, Mathematics and Sciences. Starting date: July 1, 1999. The School consists of departments of: Biological Sciences; Chemistry & Physics; Engineering; and Mathematics, Computer Science & Statistics. PUC is a comprehensive university of 9,400 students. The University is located in Hammond, Indiana, a metropolitan area adjacent to Chicago.

The successful candidate will have the following characteristics: earned doctorate in a discipline with the purview of the School; record of personal academic accomplishments at the university level commensurate with appointment to the faculty at the rank of professor; demonstrated excellence in teaching; proven record of scholarship; prior administrative experience as dean, department head, or equivalent; understanding of the disciplines within the School.

Applications must include: letter of application, including a personal statement of qualifications; curriculum vitae; names, addresses, and telephone numbers of five professional references. Review of applications will begin February 1, 1999, and will continue until position is filled. Send materials to:
Secretary, EMS Dean Selection Advisory Committee
Academic Affairs
Purdue University Calumet
Hammond, IN 46323

For more information about Purdue University Calumet, visit http://www.calumet.purdue.edu/. Purdue University Calumet is an Equal Access/Equal Opportunity University.

IOWA

IOWA STATE UNIVERSITY
Department of Mathematics

The Department seeks applicants, pending funding, for two tenure-track positions to begin in the fall of 1999. The positions are expected to be at the assistant professor level, but exceptional candidates for a higher rank may be considered. An excellent record in research and teaching is required, and experience beyond the Ph.D. is desirable.

One position is targeted at control theory and practice. We are interested in a mathematician who can interact with current faculty in the Department as well as with the numerous faculty in other departments interested in control problems.

The second position is targeted at areas of applied mathematics that are complementary to the existing strengths in the Department. These include partial differential equations, numerical analysis, control theory, computational and mathematical biology, stochastic analysis, and discrete mathematics applied to computer science and other problems.

Applicants must indicate which position(s) they are applying for and submit a vita and a brief statement describing their research accomplishments and plans. They must also arrange for the submission of their graduate transcripts and four letters of recommendation, one of which must address the applicant's teaching ability and experience. All application materials should be sent to: Max Gunzburger, Department of Mathematics, Iowa State University, Ames, IA 50011-2064. Applicants whose completed applications are received by February 15, 1999, are assured of receiving full consideration.

Iowa State University strongly encourages women and members of underrepresented groups to apply.

Massachusetts Institute of Technology
Department of Mathematics

The Department of Mathematics at M.I.T. invites applications for tenure-track positions at the assistant professor level. In addition, two-year non-tenure-track positions will be available. The search will focus within the following areas: algebraic geometry, applied analysis, geometric analysis, Lie theory, number theory, probability, scientific computation, and statistics. Exceptional promise in research and in teaching (at all levels of the curriculum) is required. Although this search focuses on junior-level appointments, candidates for more senior-level appointments will be considered. Applicants should send a curriculum vitae and at least three letters of recommendation to: Search Committee,

MASSACHUSETTS INSTITUTE OF TECHNOLOGY
Department of Mathematics

Open to mathematicians with doctorates who show definite promise in research. Teaching loads are six hours per week during one semester and three hours per week during the other. Applications should be completed by January 1. Please arrange to have sent (a) a vita, (b) three letters of reference, (c) a description of the research in your thesis, and (d) the research which you plan for next year to: Pure Mathematics Committee, Massachusetts Institute of Technology, Room 2-263, Cambridge, MA 02139-4307. M.I.T. is an Equal Opportunity/Affirmative Action Employer.

Massachusetts Institute of Technology
Department of Mathematics

Applications are invited for a limited number of positions in mathematics starting fall 1999. Available positions include instructorships, lecturerships, assistant professorships, and possibly higher levels. Appointments will be made mainly on the basis of demonstrated research accomplishment and potential. Complete applications must be received by January 8. To apply, please send a vita with a description of your recent research and research plans, and arrange to have three letters of reference sent. Address: Committee on Applied Mathematics, Room 2-345, Department of Mathematics, Massachusetts Institute of Technology, Cambridge, MA 02139-4307. M.I.T. is an Equal Opportunity/Affirmative Action Employer.

University of Massachusetts, Amherst
Mathematics & Statistics

Applications are invited for a limited number of positions in applied mathematics starting fall 1999. Available positions include instructorships, lecturerships, assistant professorships, and possibly higher levels. Appointments will be made mainly on the basis of demonstrated research accomplishment and potential. Complete applications must be received by January 8. To apply, please send a vita with a description of your recent research and research plans, and arrange to have three letters of reference sent. Address: Committee on Applied Mathematics, Room 2-345, Department of Mathematics, Massachusetts Institute of Technology, Cambridge, MA 02139-4307. M.I.T. is an Equal Opportunity/Affirmative Action Employer.
Department of Mathematics & Statistics, University of Massachusetts, Amherst, MA 01003-4515. Review of applications will begin immediately. Women and members of minority groups are encouraged to apply. Applications will continue to be accepted until all positions are filled. Please include the AMS Application Cover Sheet. Equal Opportunity/Affirmative Action Employer.

UNIVERSITY OF MASSACHUSETTS, AMHERST
Mathematics & Statistics

The Department of Mathematics & Statistics (http://www.math.umass.edu/) invites applications for tenure-track positions at the assistant professor level. In addition, two-year non-tenure-track positions will be available. Applicants should have a background in theoretical statistics and have an interest in applications, interdisciplinary work, and computation. Exceptional promise in research and in teaching (at all levels of the curriculum) is required. Although this search focuses on junior-level appointments, candidates for more senior-level appointments will be considered. Applicants should send a curriculum vitae and at least three letters of recommendation to: Search Committee, Department of Mathematics & Statistics, University of Massachusetts, Amherst, MA 01003-4515. Review of applications will begin immediately. Women and members of minority groups are encouraged to apply. Applications will continue to be accepted until all positions are filled. Please include the AMS Application Cover Sheet. Equal Opportunity/Affirmative Action Employer.

MICHIGAN

WESTERN MICHIGAN UNIVERSITY
Department of Mathematics and Statistics

Western Michigan University seeks applications for two tenure-track assistant professor positions in algebra to begin in August 1999, pending budgetary approval. A doctorate degree, excellent teaching ability, and a strong commitment to research and scholarship are required. Preference will be given to applicants with research interests in one of the areas of representation theory of finite groups, group algebras, group rings, or algebraic number theory. Outstanding applicants will be considered at the associate professor level. Salary and fringe benefits are competitive. Western Michigan University, a Carnegie Classification Doctoral I Institution and Equal Opportunity Employer, has an affirmative action program which encourages applications from underrepresented groups.

Send letter of application, vita, statement of research plans, academic transcripts, and three letters of recommendation to:

John W. Petro, Chair
Department of Mathematics and Statistics
Western Michigan University
Kalamazoo, MI 49008-5152
E-mail: john.petro@wmich.edu
Phone: 616-387-4551
Fax: 616-387-4530

For information about the Department see http://www.wmich.edu/math-stat/. Review of applications will begin December 1, 1998. Applications will be accepted until the positions are filled.

MINNESOTA

UNIVERSITY OF MINNESOTA, DULUTH
Department of Mathematics and Statistics

Tenure-track assistant or assoc. professor in the applied mathematical sciences starting 8/30/99. Preferred expertise in environment-related uses of applied and/or computational mathematics or statistics. Teach two courses per term at graduate and undergraduate level, assist in master's program, direct student research, conduct active research program, perform usual service responsibilities. Ph.D. in mathematics, statistics, or related field required by 8/30/99. Competitive salary. For more information contact: Dr. Bruce Peckham, Search Committee Chair, Dept. of Math. & Stat., University of Minnesota-Duluth, Duluth, MN 55812. Review of completed applications starts 2/1/99 and continues until position filled. Full position description and application procedures at http://www.d.umn.edu/math/ or e-mail: math@umn.edu. The University of Minnesota is an Equal Opportunity Educator and Employer.

NEBRASKA

UNIVERSITY OF NEBRASKA, KEARNEY

Review of applications will begin February 1, 1999. Send application letter, curriculum vitae, three letters of reference, and undergraduate and graduate transcripts to Dr. Barton Willis, Mathematics and Statistics Faculty Search, University of Nebraska at Kearney, Kearney, NE 68849; http://www.unk.edu/AA/EO/ADA.

NEW JERSEY

THE WILLIAM PATERSON UNIVERSITY OF NEW JERSEY

The Department of Mathematics invites applications for several tenure-track positions at the assistant professor level starting September 1, 1999. The requirements are a Ph.D. in mathematics (or, for appointment as instructor, ABD with compelling evidence of expected completion), a commitment to quality teaching, and a well-defined research agenda. The Department is committed to improving the recruitment and retention of students via advisement, summer and precollegiate programs, independent student research, and curriculum development. The Department is also involved in teacher-training programs. Preference will be given to candidates with demonstrated interest in these activities.

For the first position in applied mathematics (Position #MA1), the Department seeks candidates with specialty in an area of applied analysis. For the second position (Position #MS2), preference will be given to candidates with demonstrated interest in experience in teaching statistics and developing statistics curriculum.

Send a letter of interest clearly stating the name and number of the position, current vita, graduate transcript (unofficial), and three letters of reference (at least one letter or other evidence should address the applicant’s ability to teach effectively) to: Dr. Mahendra Jani, Chairperson, Department of Mathematics, William Paterson University, Wayne, NJ 07470. Review of applications will begin immediately and will continue until the position is filled. WPUNJ is an Equal Opportunity/AAD Employer and actively seeks applications from women, minorities, and underrepresented groups.

NEW YORK

DAEMAN COLLEGE
Dept. of Mathematics & Computer Science

Applications invited for tenure-track assistant professor position beginning 8/99. Duties include teaching 12 credit hours/semester, including computer science courses. Ph.D. in mathematics or statistics, teaching experience, and a strong commitment to quality teaching and research required.

Daemen College is a private coeducational institution offering baccalaureate and master's-level degree programs. Located on a scenic suburban campus in western New York, Daemen College is a dynamic independent institution with
OKLAHOMA

THE UNIVERSITY OF OKLAHOMA
Department of Mathematics

Applications are invited for one full-time, tenure-track position beginning August 16, 1999. The position is initially budgeted at the assistant professor level, but an appointment at the associate professor level may be possible for an exceptionally qualified candidate with qualifications and experience appropriate to that rank. Normal duties consist of teaching two courses per semester, conducting research, and rendering service to the department, university, and profession at a level appropriate to the faculty member's experience. The position requires an earned doctorate and research interests that are compatible with those of the existing faculty; preference will be given to applicants with potential or demonstrated excellence in research and prior successful undergraduate teaching experience. Salary and benefits are competitive. For full consideration applicants should send a completed AMS Cover Sheet, curriculum vitae, a description of current and planned research, and three letters of recommendation (at least one of which must address the applicant's teaching experience and proficiency) to: Search Committee Department of Mathematics University of Oklahoma 601 Elm, Phsc 423 Norman, OK 73019 Tel: 405-325-6711 Fax: 405-325-7484 E-mail: searchmath@ou.edu

Screening of applications will begin on December 15, 1998, and will continue until the position is filled. The University of Oklahoma is an Equal Opportunity/Affirmative Action Employer. Women and minorities are encouraged to apply. OU has a policy of being responsive to the needs of dual-career couples.

OREGON

PORTLAND STATE UNIVERSITY
Department of Mathematical Sciences
Assistant Professor Positions

Applications are invited for one or more assistant professor positions in analysis, applied mathematics, numerical methods, and/or statistics beginning September 16, 1999. Applications are expected to have demonstrated outstanding research potential and to have a strong interest and ability in teaching. Of particular interest are candidates with a commitment to interdisciplinary research and who are knowledgeable in scientific computation.

Applicants should submit a letter of application, a curriculum vitae, a description of research interests, and three letters of recommendation to: Search Committee Chair, Department of Mathematical Sciences, Rensselaer Polytechnic Institute, Troy, NY 12180. Evaluation of applications will begin January 15, 1999, and will continue until a candidate is selected.

Rensselaer is an Equal Opportunity/Affirmative Action Employer and strongly encourages applications from women and underrepresented minorities.

PENNSYLVANIA

WEST CHESTER UNIVERSITY

The Department of Mathematics invites applications for a tenure-track assistant professor position in mathematics beginning August, 1999. Responsibilities include teaching twelve hours per semester assigned from among undergraduate and graduate courses in statistics and mathematics. Candidates must possess a Ph.D. in mathematics with at least a master's degree in statistics or possess a Ph.D. in statistics. Preference will be given to candidates holding a Ph.D. in statistics as well as to those with applied statistical experience. A strong potential for excellence in teaching and a proven record of excellence in scholarship are required.

To apply, submit a curriculum vitae, a brief statement of teaching philosophy, a brief research prospectus, graduate degree transcripts, and three letters of recommendation. Submission of evidence of teaching effectiveness is encouraged. Review of applications will begin immediately and will continue until the position is filled. Finalists must successfully complete an interview and demonstration of teaching effectiveness. Applicants should submit all materials to: Dr. Richard Branton, Chair, Search Committee, Department of Mathematics, West Chester University, West Chester, PA 19383. No applications by fax or e-mail.

West Chester University is an Affirmative Action/Equal Opportunity Employer. Women and minorities are encouraged to apply.

TENNESSEE

UNIVERSITY OF TENNESSEE AT KNOXVILLE

The mathematics department at the University of Tennessee at Knoxville seeks to fill a postdoctoral position in some part of algebra. The position is guaranteed for two years and may be extended for a third year if performance is satisfactory. Continuation at the University of Tennessee
beyond the third year is not possible. The teaching load for this position will be three semester-long courses during each academic year.

Candidates should provide evidence of their ability to teach in English and should have had their Ph.D. for no more than two years by September 1999.

Candidates should submit a curriculum vitae, a description of their research accomplishments and plans, and a statement about teaching. These documents as well as three letters of recommendation should be submitted to Professor John B. Conway, Dept. of Mathematics, University of Tennessee, Knoxville, TN 37996-1300. Use of the recent AMS application form is encouraged.

UTK is an EEO/AA/Title IX/Section 504/ADA Employer.

SWITZERLAND

THE SWISS FEDERAL INSTITUTE OF TECHNOLOGY ZURICH (ETHZ)

The Swiss Federal Institute of Technology Zurich (ETHZ) invites applications for an assistant professor of mathematics.

Duties of this position include, in addition to research, an active participation in the teaching of courses for students of mathematics, natural sciences, and engineering.

Candidates should have a doctorate or equivalent and have demonstrated the ability to carry out independent research. Willingness to teach at all university levels and to collaborate with colleagues is expected.

This assistant professorship has been established to promote the careers of younger scientists. Initial appointment is for three years, with the possibility of renewal for an additional three years.

Applications with curriculum vitae and a list of publications should be submitted to the president of ETH Zurich, Prof. Dr. O. Kühler, ETH Zentrum, CH-8092 Zurich, no later than March 31, 1999. The ETHZ specifically encourages female candidates to apply with a view toward increasing the proportion of female professors.

PUBLICATIONS WANTED

MATHEMATICS BOOKS PURCHASED

Pure & appl. adv. & research level, any age, usable cond. Reprints OK. One box to whole libraries sought. Contact: Collier Brown or Kirsten Berg @ Powell's Technical Bks., Portland, OR. Call 800-225-6911, fax 503-228-0505, or e-mail: kirsten@technical.powells.com.

This volume is based on proceedings held during the DIMACS workshop on Randomization Methods in Algorithm Design in December 1997 at Princeton. The workshop was part of the DIMACS Special Year on Discrete Probability. It served as an interdisciplinary research workshop that brought together a mix of leading theorists, algorithmists and practitioners working in the theory and implementation aspects of algorithms involving randomization.

Major topics covered include randomization techniques for linear and integer programming problems, randomization in the design of approximate algorithms for combinatorial problems, randomization in parallel and distributed algorithms, practical implementation of randomized algorithms, de-randomization issues, and pseudo-random generators. The volume would be suitable as a graduate or advanced graduate text.

DIMACS: Series in Discrete Mathematics and Theoretical Computer Science
Volume 43: 1999; 318 pages; Hardcover; ISBN 0-8218-0916-4; List $69; Individual member $41; Order code DIMACS43/NA

All prices subject to change. Charges for delivery are $3.00 per order. For optional air delivery outside of the continental U.S., please include $6.50 per item. Prepayment required. Order from: American Mathematical Society, P.O. Box 5094, Boston, MA 02206-5094, USA. For credit card orders, fax 1-401-455-4496 or call toll free 1-800-321-4AMS (4267) in the U.S. and Canada, 1-401-455-4000 worldwide. Or place your order through the AMS bookstore at www.ams.org/bookstore/. Residents of Canada, please include 7% GST.

DocuTéXing

DocuTéXing is a high-quality TeX typesetting facility for mathematical journals and monographs. Our services also include HTML coding, reference validation, and illustrations. We can see an electronic journal through from start to finish. For more information, samples, and references, please e-mail main-office@DocuTeXing.com or visit http://www.DocuTeXing.com/.

We are pleased to announce that our mathematics journals

- Journal für die reine und angewandte Mathematik (Crelle’s Journal)
- Forum Mathematicum
- Journal of Group Theory

are available online on the World Wide Web.

We are offering full text articles in PDF or PostScript format. Viewing articles in PDF format requires Adobe’s free Acrobat Reader software, which is also available via our web site.

For information on obtaining online access for your institution or library, please contact us at:
wdg-info@deGruyter.com

A free online sample issue as well as additional information about these and other Walter de Gruyter journals are available on our web site:

The text is a form for applying for membership in the American Mathematical Society for the year 1999. The form includes sections for personal information such as name, address, birth details, and education. There are also sections for fields of interest, areas of specialization, and prepayment methods. The form is designed to help determine the membership category for which the applicant is eligible.
**Membership Categories**

Please read the following to determine what membership category you are eligible for, and then indicate below the category for which you are applying.

**Introductory ordinary member rate** applies to the first five consecutive years of ordinary membership. Eligibility begins with the first year of membership in any category other than student and nominee. Dues are $50.

For **ordinary members** whose annual professional income is below $55,000, the dues are $99; for those whose annual professional income is $55,000 or more, the dues are $132.

The **CMS cooperative rate** applies to ordinary members of the AMS who are also members of the Canadian Mathematical Society and reside outside of the U.S. For members whose annual professional income is $55,000 or less, the dues are $33; for those whose annual professional income is above $55,000, the dues are $112.

For a **joint family membership**, one member pays ordinary dues, based on his or her income; the other pays ordinary dues based on his or her income, less $20. (Only the member paying full dues will receive the Notices and the Bulletin as a privilege of membership, but both members will be accorded all other privileges of membership.)

Minimum dues for **contributing members** are $198. The amount paid which exceeds the higher ordinary dues level and is purely voluntary may be treated as a charitable contribution.

For **either students or unemployed individuals**, dues are $33, and annual verification is required.

The annual dues for **reciprocity members** who reside outside the U.S. and Canada are $66. To be eligible for this classification, members must belong to one of the foreign societies with which the AMS has established a reciprocity agreement, and annual verification is required. Reciprocity members who reside in the U.S. or Canada must pay ordinary member dues ($99 or $132).

The annual dues for **category-S members**, those who reside in developing countries, are $16. Members can choose only one privilege journal. Please indicate your choice below.

Members can purchase a **multi-year membership** by prepaying their current dues rate for either two, three, four or five years. This option is not available to category-S, unemployed, or student members.

**1999 Dues Schedule (January through December)**

**Introductory ordinary member rate** ........................................... $50

**Ordinary member** ............................................................... $99 $132

**CMS cooperative rate** .......................................................... $94 $112

**Joint family member (full rate)** ............................................. $99 $112

**Joint family member (reduced rate)** ....................................... $79 $112

**Contributing member (minimum $192)** ....................................

**Student member (please verify)** ........................................... $33

**Unemployed member (please verify)** ..................................... $33

**Reciprocity member (please verify)** ..................................... $96 $132

**Category-S member** ............................................................. $16

**Multi-year membership** .............................................................

1 **Student Verification** (sign below)

I am a full-time student at .............................................................. currently working toward a degree.

2 **Unemployed Verification** (sign below) I am currently unemployed and actively seeking employment.

3 **Reciprocity Membership Verification** (sign below) I am currently a member of the society indicated on the right and am therefore eligible for reciprocity membership.

Publications, videotapes, and miscellaneous items are sent via UPS to U.S. addresses and as printed matter elsewhere unless another delivery method is requested. Charges for delivery are $3.00 per order; for optional air delivery outside the continental U.S., please add $6.50 per item. Journal back numbers, Mathematical Reviews indexes, and review volumes are sent via surface mail to any destination unless air delivery is requested. Postage for surface mail is paid by the AMS. Air delivery rates, which will be quoted upon request, must be paid by the purchaser.

**Exam Copies:** Complimentary exam copies are available for AMS titles marked "Recommended Text." Other AMS titles are sent on a 30-day examination basis. To order an exam copy, please forward your request on university letterhead. Specify Course Title, Term Taught, Enrollment, and the Current Text Used. Send the information to: Lori Sprague, Sales Administrator, American Mathematical Society, P.O. Box 6248, Providence, RI 02940-6248. 1-800-321-4AMS (4267), U.S. and Canada, 1-401-455-4000, worldwide. E-mail: las@ams.org, fax: 1-401-331-3842.

**Visit the AMS Bookstore at** [www.ams.org/bookstore/](http://www.ams.org/bookstore/)
Members of the Society who move or change positions are urged to notify the Providence Office as soon as possible.

Journal mailing lists must be printed four to six weeks before the issue date. Therefore, in order to avoid disruption of service, members are requested to provide the required notice well in advance.

Besides mailing addresses for members, the Society's records contain information about members' positions and their employers (for publication in the Combined Membership List). In addition, the AMS maintains records of members' honors, awards, and information on Society service.

When changing their addresses, members are urged to cooperate by supplying the requested information. The Society's records are of value only to the extent that they are current and accurate.

If your address has changed or will change within the next two or three months, please fill out this form, supply any other information appropriate for the AMS records, and mail it to:

AMERICAN MATHEMATICAL SOCIETY
P. O. Box 6248
Providence, RI 02940-9943
In celebration of its 50th anniversary, the Canadian Mathematical Society published three comprehensive volumes encompassing the achievements, research and publications of the Canadian mathematical community.

Volume I: Mathematics in Canada: $50.00 US

This volume is the history of mathematics in Canada, including that of the Canadian Mathematical Society. The volume is situated in context by two papers from the Proceedings of the First Canadian Mathematical Congress that discuss the state of mathematical research and graduate training in 1945 and make recommendations for the future. Personal reminiscences and recollections of the founders of the First Canadian Mathematical Congress bring history to life in this volume.

Volume II: Selected Papers and Historical Index for Canadian Journal of Mathematics and Canadian Mathematical Bulletin: $50.00 US

Some of the best papers published in the Canadian Journal of Mathematics and the Canadian Mathematical Bulletin are presented here, along with a cumulative index of articles published in both publications. This volume features an article co-authored by Albert Einstein.

Volume III: Invited Papers: $50.00 US

Some of the outstanding mathematical achievements of Canadian mathematicians are highlighted in this volume. Some of the surveys focus on individual research; others give rich overviews tracing developments of the subject.

HUGE SAVINGS for orders placed before April 30, 1999!

Get the complete 3-volume set for the price of 2 volumes!

Limited time offer: 3-volume set only $100 US*

*Please add $15 shipping and handling on all orders.

Get your 3-volume set while they last!

Meetings & Conferences of the AMS

PROGRAM ALERT: In order that AMS meeting programs include the most timely information for each speaker, abstract deadlines have been moved to dates much closer to the meeting. What this means is that most meeting programs will appear in the Notices "after" the meeting takes place. However, complete meeting programs will be available on e-MATH about two to three weeks after the abstract deadline. "Remember", e-MATH is your most comprehensive source for up-to-date meeting information. See http://www.ams.org/meetings/.

For abstracts: January 27, 1999
Control and Dynamics of Partial Differential Equations (Code: AMS SS A1), Zhonghai Ding, University of Nevada, Las Vegas.

Diophantine Problems (Code: AMS SS J1), Arthur Baragar, University of Nevada, Las Vegas, and Michael Bennett, University of Illinois.

Geometric Group Theory (Code: AMS SS H1), Eric M. Freden, Southern Utah University, and Eric Lewis Swenson, Brigham Young University.

Graph Theory (Code: AMS SS B1), Hung-Lin Fu, National Chiao-Tung University, Taiwan, Chris A. Rodger, Auburn University, and Michelle Schultz, University of Nevada, Las Vegas.

Invariants, Distributions, Differential Operators and Harmonic Analysis (Code: AMS SS K1), Ronald L. Lipsman, University of Maryland, College Park.

Nonlinear PDEs—Methods and Applications (Code: AMS SS C1), David Costa, University of Nevada, Las Vegas.

Number Theory (Code: AMS SS F1), Gennady Bachman, University of Nevada, Las Vegas, Richard A. Mollin, University of Calgary, and Peter J. Shiue, University of Nevada, Las Vegas.

Numerical Analysis and Computational Mathematics (Code: AMS SS E1), Jun Zhang, University of Minnesota and University of Kentucky, and Jennifer Zhao, University of Michigan, Dearborn.

Set Theory (Code: AMS SS D1), Douglas Burke and Derrick DuBose, University of Nevada, Las Vegas.

Symmetries of Knots and Three-Manifolds (Code: AMS SS M1), Swatee Naik, University of Nevada, Reno, and Jozef H. Przytycki, George Washington University.

Accommodations
Participants should make their own arrangements directly with the hotel of their choice and state that they will be attending the American Mathematical Society meeting. The AMS is not responsible for rate changes or for the quality of the accommodations. Hotels listed provide free airport shuttle service upon request.

Days Inn Airport, 5125 Swenson, Las Vegas, NV; 800-634-6439; $49.50/single or double. Rate includes tax.

La Quinta, 3970 Paradise Road, Las Vegas, NV; 702-7796-9000; $65.40/single or double. Rate includes tax and continental breakfast.

Quality Inn, 377 E. Flamingo Road, Las Vegas, NV; 702-733-7777; $75.21/single or double.

Food Service
There are a number of restaurants located near Classroom Building Complex-C. A list of restaurants will be available at the registration desk.

Local Information
Please visit the Web site maintained by the Department of Mathematical Sciences at www.unlv.edu/Colleges/Sciences/Mathematics/ and the University of Nevada Web site, www.unlv.edu/.

Other Activities
AMS Book Sale: Examine the newest titles from the AMS! Most books will be available at a special 50% discount offered only at meetings. Complimentary coffee will be served, courtesy of AMS Membership Services.

Parking
Participants should park in the Thomas & Mack parking area and may use any meter, student, or staff area. There is no charge for weekend parking. Due to construction, participants should use the parking lot entrance from Tropicana onto Thomas & Mack Drive, not the Swenson entrance.

Registration and Meeting Information
The registration desk will be located in the 2nd floor lobby of Classroom Building Complex-C (CBC-C) and will be open from 7:30 a.m. to 5:00 p.m. on Saturday and from 8:00 a.m. to noon on Sunday.

Registration Fees: (payable on-site only) $30/AMS members; $45/nonmembers; $10/emeritus members, students, or unemployed mathematicians. Fees are payable by cash, check, VISA, MasterCard, Discover, or American Express.

Travel
By air: McCarren International Airport is located approximately 2 miles from the UNLV campus. Several auto rental companies are located at the airport. Taxi, shuttle, and limousine services are readily available at the airport.

Driving: UNLV is located north of the Tropicana Avenue and Maryland Parkway intersection. The airport exits by way of Swenson Avenue to Tropicana Avenue. From Swenson go right on to Tropicana, then left onto Thomas & Mack Drive.

Weather
The April average high temperature is 78°F and low temperature is 50°F. The climate is typically dry, with an average of .17 inches of rainfall in April.

Buffalo, New York
State University of New York at Buffalo

April 24-25, 1999

Meeting #943
Eastern Section
Associate secretary: Lesley M. Sibner
Announcement issue of Notices: February 1999
Program issue of Notices: June 1999
Issue of Abstracts: Volume 20, Issue 3

Deadlines
For organizers: Expired
For consideration of contributed papers in Special Sessions: January 6, 1999
For abstracts: March 3, 1999
Meetings & Conferences

Invited Addresses

Michele M. Audin, Université Louis Pasteur, Integrable systems and spaces of curves.
Russel Caflisch, University of California, Los Angeles, Title to be announced.
Jeffrey H. Smith, Purdue University, Symmetric spectra.
Alexander Voronov, MIT, Operad theory and some applications.
Gregg J. Zuckerman, Yale University, Harmonic algebra.

Special Sessions

Combinatorics and Graph Theory (Code: AMS SS C1), Harris Kwong, SUNY College at Fredonia.
Complex Geometry (Code: AMS SS G1), Terrence Napier, Lehigh University, and Mohan Ramachandran, SUNY at Buffalo.
Integrable Systems (Code: AMS SS J1), Michele M. Audin, Université Louis Pasteur and NCRS, and Lisa Claire Jeffrey, McGill University.
Knots and 3-Manifolds (Code: AMS SS E1), Thang T. Q. Le, SUNY at Buffalo, William W. Menasco, SUNY at Buffalo, and Morwen B. Thistlethwaite, University of Tennessee.

Mathematical Physics (Code: AMS SS D1), Jonathan Dimock, SUNY at Buffalo.
Operads, Algebras, and Their Applications (Code: AMS SS H1), Alexander A. Voronov, Massachusetts Institute of Technology.
Representations of Lie Algebras (Code: AMS SS F1), Duncan J. Melville, Saint Lawrence University.
Thin Films: Solid and Liquid (Code: AMS SS B1), E. Bruce Pitman, SUNY at Buffalo, and Brian Spencer, SUNY at Buffalo.

Accommodations

Participants should make their own arrangements directly with a hotel of their choice. Special rates have been negotiated at the hotel listed below. Participants should state that they will be attending the American Mathematical Society meeting and cite any special codes shown below. Reservations should be made as early as possible. Rate cited does not include tax of 13%.

Hyatt Regency Buffalo, Two Fountain Plaza (in the heart of downtown), 716-856-1234 (fax: 716-852-6157); $69/single or double; restaurant and lounge on premises (within walking distance of many restaurants); access from lobby to light rail line which goes directly to the UB South Campus (approximately $1.25 one way, $2.50 round trip; purchase a ticket from the vending machines prior to boarding the train and keep the ticket with you. There is a substantial penalty for lost tickets. Because of the later Sunday schedule for the light rail line, the University will sponsor a limited shuttle on Sunday morning from this hotel only for those who wish to get to the campus before 9:30 a.m.; free parking. Deadline for reservations is March 26, 1999.

Food Service and Local Information

There are a number of restaurants available within walking distance of the meeting location, and other restaurants within walking distance of the various recommended hotels and motels. More detailed information will be available at the registration desk and on the UB Department of Mathematics Web site; see www.math.buffalo.edu/ and www.buffalo.edu/.

Other Activities

AMS Book Sale: Examine the newest titles from the AMS. Most books will be available at a special 50% discount offered only at meetings. Complimentary coffee will be served courtesy of AMS Membership Services.

Parking

Diefendorf Lot on UB’s South Campus will be open for parking without charge throughout the weekend. The lot is located adjacent to Diefendorf Hall and is accessed via Sherman Road from Bailey Avenue (Rte. 62). For those wishing to visit the mathematics department during the week, visitor’s hang tags are available from the department.
Registration and Meeting Information
N.B. This meeting will be held on the South Campus of the State University of New York at Buffalo.

Registration will take place in Room 114, Diefendorf Hall (Math Department Lounge), from 7:30 a.m. to 4:00 p.m. on Saturday and from 8:00 a.m. to noon on Sunday. All sessions and talks will take place in Diefendorf Hall.

Registration fees (payable on-site only) are $30/AMS or CMS members; $45 nonmembers; $10 emeritus members, students, or unemployed mathematicians. Fees are payable by cash, check, VISA, MasterCard, Discover, or American Express.

Travel
By air: The Greater Buffalo International Airport is the closest airport.

Delta Air Lines has been selected as the official airline for this meeting. The following specially negotiated rates are available exclusively to mathematicians and their families for the period April 21-28, 1999, on Delta Air Lines:

- 5% discount off published round-trip fares within the continental U.S., Hawaii, Alaska, Canada, Mexico, Bermuda, San Juan, Nassau, and the U.S. Virgin Islands. Some restrictions apply and seats are limited (no discounts apply on Delta Express). By purchasing your ticket 60 days or more prior to departure, you can receive an additional 5% bonus discount.
- 10% discount on Delta’s domestic system for travel based on the published unrestricted round-trip coach (Y06) rates. No advance reservations or ticketing is required; however, by purchasing your ticket 60 days or more prior to departure, you can receive an additional 5% bonus discount (no discounts on Delta Express).

Special guaranteed round-trip Zone Fares to all cities served by Delta and Delta Express in the continental U.S., Hawaii, Alaska, Canada, Mexico, Bermuda, San Juan, Nassau, and the U.S. Virgin Islands for savings on midweek travel. Two-day minimum stay, no Saturday-night stay required, seven days’ advanced reservations and ticketed. Fares are fully refundable, less administrative service fee. Zone Fares are not valid for destinations served only by a zone carrier. For reservations call (or have your travel agent call) Delta Meeting Network Reservations at 1-800-241-6760 weekdays between 7:30 a.m. and 11:00 p.m. (8:30 a.m.-11:00 p.m. on weekends) Eastern Standard Time. Refer to file number 117809A. These discounts are served by Delta and Delta Express in the continental U.S., Canada, and the U.S. Virgin Islands. Some restrictions apply and seats are limited (no discounts on Delta Express).

Weather
By the end of April, average high temperature in Buffalo is 60°F; average low temperature is 40°F. Buffalo averages about three inches of rain per month in April and May.

Denton, Texas
University of North Texas

May 19–22, 1999

Meeting #944
Fourth International Joint Meeting of the AMS and the Sociedad Matematica Mexicana (SMM).
Associate secretary: Lesley M. Sibner
Announcement issue of Notices: February 1999
Program issue of Notices: June/July 1999
Issue of Abstracts: Volume 20, Issue 3

Deadlines
For organizers: To be announced
For consideration of contributed papers in Special Sessions: January 27, 1999
For abstracts: March 24, 1999

Invited Addresses
Raymundo Bautista, UNAM, Title to be announced.
William Fulton, University of Michigan, Ann Arbor, Title to be announced.
Francisco Gonzalez Acuna, UNAM, Title to be announced.
Ronald L. Graham, AT&T Labs, Title to be announced (Erdős Memorial Lecture).
Jack K. Hale, Georgia Institute of Technology, Title to be announced.
Onesimo Hernandez-Lerma, CINVESTAV del IPN, Title to be announced.

Special Sessions
Algebraic Geometry and Commutative Algebra (Code: AMS SS F1), Javier Elizondo, UNAM, Xavier Gomez-Mont, CIMAT, Alberto Corso, Michigan State University, and David A. Jorgensen, University of Texas at Austin.
Algebraic Topology (Code: AMS SS Q1), Frederick R. Cohen and Samuel Gitler, University of Rochester, and Carlos Prieto, UNAM.
Combinatorics (Code: AMS SS N1), Jorge Urrutia, IMATE-UNAM and University of Ottawa, and Wlodzimierz Kuberk, Auburn University.
Complex Analysis (Code: AMS SS R1), E. Ramirez de Arellano, CINVESTAV, and John E. Fornaess, University of Michigan, Ann Arbor.
Continuum Theory (Code: AMS SS D1), Wayne Lewis, Texas Tech University, and Sergio Macias and Alejandro Illanes, UNAM.

Differential Equations, Nonlinear Analysis, and Numerical Solutions to PDEs. (Code: AMS SS E1), John W. Neuberger, University of North Texas, and Alfredo C. Nicolas, UAM.

Functional Analysis and Its Applications (Code: AMS SS C1), S. Perez-Esteva, UNAM, and Josefina Alvarez, University of New Mexico.

Geometric and Symbolic Dynamical Systems (Code: AMS SS G1), Luca Q. Zamboni, University of North Texas, and Edgardo Ugalde, University of San Luis Potosi.

Low Dimensional Topology (Code: AMS SS H1), Mark W. Brittenham, University of North Texas, Francisco Gonzalez Acuna, IM-UNAM, and Luis Valdez-Sanchez, University of Texas at El Paso.

Noncommutative Geometry, Quantum Groups, and Applications (Code: AMS SS L1), Micho Durdevich, UNAM, and Hanna Ewa Makaruk and Robert M. Owczarek, Los Alamos National Laboratory.

Nonlinear Models in Biology and Celestial Mechanics (Code: AMS SS M1), Ernesto Perez-Chavela and Jorge X. Velasco-Hernandez, UAM, Mary E. Parrott, University of South Florida, and Ernesto A. Lacomba, UAM.

Representation Theory of Algebras (Code: AMS SS A1), Jose A. de la Pena and Christof Geiss, UNAM, and Birge Zimmermann, University of California, Berkeley.

Ring Theory (Code: AMS SS K1), Carlos Signoret-Poillon, UNAM-UAM, Sergio Lopez-Permouth, Ohio University, and Ricardo Alfaro, University of Michigan, Flint.

Smooth Dynamical Systems (Code: AMS SS P1), David A. DeLatte and Dan Mauldin, University of North Texas, Jose Seade, UNAM, Mariusz Urbanski, University of North Texas, and Alberto Verjovsky, UNAM.

Stochastic Processes (Code: AMS SS J1), Frederi G. Viens, University of North Texas, Jorge A. Leon, CINVESTAV, and Juan Ruiz de Chavez, UAM.

Accommodations
Participants should make their own arrangements directly with a hotel of their choice. Special rates have been negotiated at the hotels listed below. Participants should state that they are with the Joint Meeting of the AMS and SMM and cite any special codes shown below. Reservations should be made as early as possible; some properties are small, so the number of rooms may be very limited. Rates cited do not include tax of 13.25%. The AMS is not responsible for rate changes or the quality of the accommodations chosen.

Hotels
Radisson Hotel Denton (headquarters), 2211 I-35 East North, 940-565-8499 (fax: 940-387-4729); $80 single/$85 double. Full-service hotel with restaurant, lounge, exercise room, and pool, adjacent to the university’s golf course; about a 10- or 15-minute walk to the meeting. Deadline for reservations is April 19, 1999.

Super 8 Motel, 620 I-35E (SW corner of Teasley/I-35E), 940-380-8888; $50/single or $60/double/triple; rates include Super Star breakfast; about a 15-minute drive to campus. Deadline for reservations is May 5, 1999; cite group name: AMS-SMM, and group code: AMSS.

Redbud Inn Bed and Breakfast, 815 N. Locust, 1-888-565-6414 (toll free); fax: 817-565-6515; e-mail: redbudbb@gte.net; see www.bbhost.com/redbudbb/inn with seven rooms, $56-105/single or double, $10 for each additional person; about a 10-minute drive to campus. Deadline for reservations is April 18, 1999.

Royal Hotel Suites, 1210 N. I-35E (I-35E at McCormick), 940-383-2007 (same number for fax); $35/single, $44/double/king/single suite, rates include continental breakfast; very few nonsmoking rooms; suites have efficiency kitchens but no supplies; pool; about a 12-minute walk to campus. Deadline for reservations is April 10, 1999.

Campus Residence Hall
The University is pleased to offer accommodations in a campus residence hall. Maple Hall has suites of two twin-bedded rooms which share one bath per suite. Linens are provided; participants must make their own beds. There is no maid service or room service; participants should bring all amenities, including soap, clothes hangers, alarm clock, etc. The check-in desk is staffed 24 hours a day. Rates are $12 per person double occupancy and $17 for single occupancy, payable by cash, check, or credit card (VISA, MasterCard, or Discover); pay in full when you check in at Maple Hall. There is no tax on these room rates. There will be no refunds for those who depart earlier than their paid reservation period. Rooms are available for the period May 19 to May 23; contact Diana Forson, Business Services, P.O. Box 311008, UNT, Denton, TX 76203-1008; 940-565-2894; fax: 940-369-7072; e-mail: dvf@hs1.unt.edu. See below for information on residence hall parking permits. Deadline for reservations is May 1, 1999.

Food Service and Local Information
One of the dormitory cafeterias will be open for inexpensive meals. Details on this and nearby restaurants will be available at the meeting. Watch the University of North Texas meeting Web site at www.math.unt.edu/conf.htm for up-to-the-minute developments on this and other conference details.

Other Activities
AMS Book Sale: Examine the newest titles from the AMS. Most books will be available at a special 50% discount offered only at meetings.
Complimentary refreshment breaks will be served daily courtesy of the University of North Texas Department of Mathematics. Visit the hospitality center near the AMS book sale for free brochures of area attractions.

Parking
Parking permits cost $1/day and must be purchased at the desk in Maple Hall for participants staying in the residence hall. Other participants should purchase permits (also $1/day) at the meeting registration desk in the Lyceum Lobby on the 4th floor of the University Union. You may park in the garage next to the Union ($1.15/hr.) while you purchase your parking permit; then you must move your car to an appropriate lot. The most convenient to the meeting are three lots about one block south of the parking garage, accessed from West Prairie or Highland Streets.

Registration and Meeting Information
Registration will take place in the Lyceum Lobby in the University Union on Wednesday, 3:00 p.m. to 6:00 p.m.; Thursday and Friday, 8:00 a.m. to 4:00 p.m.; and Saturday, 9:00 a.m. to noon. Sessions will take place in the University Union and another facility to be determined. The registration fee is $50, payable by cash, check, or credit card (VISA, MasterCard, Discover, or American Express). Registration in advance is strongly encouraged! Many of the social events may sell out through advance registration, so register early! The deadline for advance registration is April 12. See the paper form at the back of this issue, or see the Web form at www.ams.org/amsmtgs/2053_other.html.

Social Events
N.B. Because of the guarantees that must be given to the suppliers of the following events, tickets are AVAILABLE THROUGH ADVANCE REGISTRATION ONLY! Please register early to be assured of securing a ticket to the events which interest you.
All registered participants are invited to a gala Opening Reception to be held after the Erdős Lecture (7:00 p.m.) on Wednesday, May 19. Hot and cold hors d’oeuvres will be served, and there will be a cash bar.
Arrangements are under-way for a private showing for meeting participants at the Sky Theater planetarium on campus on Thursday evening. This spectacular multimedia display will surround you with the heavens as you’ve never seen them before! Admission to this stellar event is $2/person.
The best place to experience the legend of the Old West is in Fort Worth! On Friday evening at 5:00 p.m. your motorcoach will depart from campus and travel to the Fort...
Meetings & Conferences

Worth Stockyards (about 40 minutes away). Here you can walk along covered boardwalks and listen to local bal­

ladeers, watch hats and boots being crafted, and browse the shops and galleries. Dinner is on your own: order a Texas-size steak or barbecue at Cattlemam’s, the White Elephant Saloon, Riskey’s, Spaghetti Warehouse, or one of the other fine restaurants in the area (list will be provided). At 8:00 p.m. participants should make their way over to the Cowtown Coliseum for general admission to Friday night’s indoor rodeo. At 10:00 p.m. Billy Bob’s Texas, the world’s largest honky tonk, is waiting for you! Learn the two-step or just listen to live music, play pool, or outfit yourself in western wear at the Dry Goods Store. Buses will return to campus beginning at midnight.

Tickets are $16 and include round-trip transportation, general admission to the Cowtown Coliseum rodeo, and general admission to Billy Bob’s Texas.

The meeting will come to an end with the Closing Cer­

emonies and Banquet on Saturday evening. There will be a cash bar reception at 6:30 p.m, and dinner will be served at 7:00 p.m. Enjoy your colleagues and new friends over a delightful dinner. Music will be provided by the One O’Clock Lab Band. This jazz band is without peer among university jazz bands, having performed at the White House and been nominated for several Grammy awards. Tickets are $20 per person and include two glasses of wine with dinner.

Travel
By air: Delta Air Lines has been selected as the official airline for this meeting. The following specially negotiated rates are available exclusively to mathematicians and their families for the period May 16-25, 1999, on Delta Air Lines:

5% discount off published round-trip fares within the continental U.S., Hawaii, Alaska, Canada, Mexico, Bermuda, San Juan, Nassau, and the U.S. Virgin Islands. Some restrictions apply and seats are limited (no discounts apply on Delta Express). By purchasing your ticket 60 days or more prior to departure, you can receive an additional 5% bonus discount.

10% discount on Delta’s domestic system for travel based on the published unrestricted round-trip coach (Y06) rates. No advance reservations or ticketing is required; however, by purchasing your ticket 60 days or more prior to departure, you can receive an additional 5% bonus discount (no discounts on Delta Express).

Special guaranteed round-trip Zone Fares to all cities served by Delta and Delta Express in the continental U.S., Hawaii, Alaska, Canada, Mexico, Bermuda, San Juan, Nassau, and the U.S. Virgin Islands for savings on weekend travel. Two-day minimum stay, no Saturday-night stay required, seven days’ advanced reservations and ticketing. Fares are fully refundable less administrative service fee. Zone Fares are not valid for destinations served only by a Delta Connection carrier.

For reservations call (or have your travel agent call) Delta Meeting Network Reservations at 1-800-241-6760 weekdays between 7:30 a.m. and 11:00 p.m. (8:30 a.m. - 11:00 p.m. on weekends) Eastern Standard Time. Refer to file number 117809A. These discounts are available only through Delta Meeting Network Reservation’s toll-free number.

Participants should fly into the Dallas-Fort Worth Inter­

ternational Airport. The University of North Texas in Den­

ton is located 28 miles from the airport via Interstate 35E and Highway 121. Taxi fares are expensive, and shuttle service may not be convenient. Most participants may find it more suitable to rent a car for transportation during their stay. If you choose to rent a car, please make arrangements well in advance; the availability can be very limited. See www.bnm.com/dal.htm for deals on rental cars at the Dallas-Fort Worth Airport. For information about the airport itself, see www.dfwairport.com/.

Driving directions: From the airport: Take 121 north to I35E; follow I35E north to Denton and exit onto McCormick Street. Turn right onto McCormick, then right onto Eagle. Turn left onto Welch and left again on Prairie. The campus parking garage will be on your right.

Because of construction on the west side of campus scheduled throughout 1999, participants should check the UNT conference Web site for accurate driving directions, and Web sites for other driving directions, closer to the meeting dates.

Weather
Denton weather in mid-May normally provides daily temperatures between 63° and 84°F. Average rainfall is about 4 inches during the month, and participants should be prepared for thunderstorms that clear away the humidity.

Melbourne, Australia

Melbourne, Australia
July 12-16, 1999

Meeting #945
First International Joint Meeting of the American Mathematical Society and the Australian Mathematical Society
Associate secretary: Susan J. Friedlander
Announcement issue of Notices: March 1999
Program issue of Notices: Not applicable
Issue of Abstracts: Not applicable

Deadlines
For organizers: Expired
For consideration of contributed papers in Special Ses­

sions: To be announced
For abstracts: To be announced

Invited Addresses
Jennifer Chayes, Microsoft, Title to be announced.
Michael Eastwood, University of Adelaide, Title to be an­

nounced.
Roger Grimshaw, Monash University, Title to be announced.
Gerhard Huisken, University of Tuebingen, Title to be an­
nounced.
Vaughan Jones, University of California, Berkeley, Title to be announced.

Hyam Rubinstein, Melbourne University, Title to be announced.

Richard M. Schoen, Stanford University, Title to be announced.

Neil Trudinger, Australian National University, Title to be announced.

Special Sessions

Algebraic Groups and Related Topics, Eric Friedlander, Northwestern University, and Gustav I. Lehrer, University of Sydney.

Fluid Dynamics, Susan Friedlander, Northwestern University, and Roger H. J. Grimshaw, Monash University.

Geometric Analysis and Partial Differential Equations, Benjamin H. Andrews, Australian National University, Michael G. Eastwood, University of Adelaide, Klaus Ecker, Monash University, and Gerhard Huisken, Princeton University and University of Tuebingen.

Geometric Group Theory, Swarup Gadde and Walter Neumann, University of Melbourne.

Geometric Themes in Group Theory, Gustav I. Lehrer, University of Sydney, Cheryl E. Praeger, University of Western Australia, and Stephen D. Smith, University of Illinois at Chicago.

Group Actions, Marston Conder, Gaven Martin, and Eamonn O'Brien, University of Auckland.

Low Dimensional Topology, William H. Jaco, Oklahoma State University, and Hyam Rubinstein, Melbourne University.

Mathematical Physics: Many Body Systems, Alan L. Carey, University of Adelaide, Paul A. Pearce, University of Melbourne, and Mary Beth Ruskai, University of Massachusetts, Lowell.

Mathematics Learning Centers, Judith Baxter, University of Illinois, Chicago, Jackie Nicholas, University of Sydney, and Jeanne Wald, Michigan State University.

Moduli Spaces of Riemann Surfaces, Mapping Class Groups and Invariants of 3-Manifolds, Ezra Getzler, Northwestern University, and Richard Hain, Duke University.

Nonlinear Dynamics and Optimization, A. F. Ivanov, Penn State University and University of Ballarat, A. Mees, University of Western Australia, and A. Rubinov, University of Ballarat.

Probability Theory and Its Applications, Timothy Brown, University of Melbourne, Phil Pollett, University of Queensland, and Ruth J. Williams, University of California, San Diego.

Recent Trends in Operator Theory and Harmonic Analysis, Michael T. Lacey, Georgia Institute of Technology, and Alan G. R. McIntosh, Macquarie University.

Vaughan Jones, University of California, Berkeley, Title to be announced.

Hyam Rubinstein, Melbourne University, Title to be announced.

Richard M. Schoen, Stanford University, Title to be announced.

Neil Trudinger, Australian National University, Title to be announced.

Special Sessions

Algebraic Groups and Related Topics, Eric Friedlander, Northwestern University, and Gustav I. Lehrer, University of Sydney.

Fluid Dynamics, Susan Friedlander, Northwestern University, and Roger H. J. Grimshaw, Monash University.

Geometric Analysis and Partial Differential Equations, Benjamin H. Andrews, Australian National University, Michael G. Eastwood, University of Adelaide, Klaus Ecker, Monash University, and Gerhard Huisken, Princeton University and University of Tuebingen.

Geometric Group Theory, Swarup Gadde and Walter Neumann, University of Melbourne.

Geometric Themes in Group Theory, Gustav I. Lehrer, University of Sydney, Cheryl E. Praeger, University of Western Australia, and Stephen D. Smith, University of Illinois at Chicago.

Group Actions, Marston Conder, Gaven Martin, and Eamonn O'Brien, University of Auckland.

Low Dimensional Topology, William H. Jaco, Oklahoma State University, and Hyam Rubinstein, Melbourne University.

Introduction to Approximation Theory
Second Edition
E. W. Cheney

E. W. Cheney's highly respected and well-known book... covers an enormous amount of material... [It is] written with clarity and precision which those who are familiar with the author's many papers have come to expect...

The text contains the standard topics that one expects in an intermediate book in this field... [The author] has made use of an interesting combination of classical and modern analysis in his proofs... Because of the author's emphasis on constructive methods for solving problems which are of physical interest, this book will likely be as welcome to the engineer and the physicist as to the mathematician...

Anyone involved with computer mathematics will want it nearby.

—Computing Reviews

Particular Differential Equations
P. R. Garabedian

This book is primarily a text for a graduate course in partial differential equations; although the later chapters are devoted to special topics not ordinarily covered in books in this field... [The author] has made use of an interesting combination of classical and modern analysis in his proofs... Because of the author's emphasis on constructive methods for solving problems which are of physical interest, this book will likely be as welcome to the engineer and the physicist as to the mathematician...

The text contains the standard topics that one expects in an intermediate PDE course: the Dirichlet and Neumann problems, Cauchy's problem, characteristics, the fundamental solution, PDEs in the complex domain, plus a chapter on finite differences, on nonlinear fluid mechanics, and another on integral equations.

—Mathematical Reviews

Classical Galois Theory with Examples
Lisl Gaal

This book is strongly recommended to beginning graduate students who already have some background in abstract algebra. The exposition and proofs are intended to present Galois theory in as simple a manner as possible... The large number of partially or fully solved examples is its special feature.

—Mathematical Reviews

AMSA Chelsea Publishing; 1982; 259 pages; Hardcover; ISBN 0-8218-1374-9; List $20; All AMS members $16; Order code CHEL/317-HRT92

Introduction to Hilbert Space and the Theory of Spectral Multiplicity
Second Edition
Paul R. Halmos

The main purpose of this book is to present the so-called multiplicity theory and the theory of unitary equivalence, for arbitrary spectral measures, in separable or not separable Hilbert space... The approach to this theory, as presented by the author, has much claim to novelty. By a skillful permutation of the fundamental ideas of Weyl and Nekano and consistently referring to the simple situation in the finite-dimensional case, the author succeeds in presenting the theory in a clear and perspicuous form.

How to Teach Mathematics
Second Edition
Steven G. Krantz, Washington University, St. Louis, MO

Praise for the First Edition...
An original contribution to the educational literature on teaching mathematics at the post-secondary level. The book itself is an explicit proof of the author's claim "teaching can be rewarding, useful, and fun."

—Zentralblatt für Mathematik

This expanded edition of the original bestseller, How to Teach Mathematics, offers hands-on guidance for teaching mathematics in the modern classroom setting. Twelve appendices have been added that are written by experts who have a wide range of opinions and viewpoints on the major teaching issues.

The breadth of this text makes it accessible to areas other than mathematics. The principles presented can apply to a variety of disciplines—from music to English to business. Lively and humorous, yet serious and sensible, this volume offers readers incisive information and practical applications.

1999; 337 pages; Hardcover; ISBN 0-8218-1398-6; List $24; All AMS members $19; Order code HTM/92HRT92

### Meetings and Conferences of the AMS

**Associate Secretaries of the AMS**

**Western Section:** Bernard Russo, Department of Mathematics, University of California, Irvine, CA 92697; e-mail: brusso@math.uci.edu; telephone: 949-824-5505.

**Central Section:** Susan J. Friedlander, Department of Mathematics, University of Illinois at Chicago, 851 S. Morgan (M/C 249), Chicago, IL 60607-7045; e-mail: susan@math.nwu.edu; telephone: 312-996-3041.

**Eastern Section:** Lesley M. Sibner, Department of Mathematics, Polytechnic University, Brooklyn, NY 11201-2990; e-mail: lsibner@magnus.poly.edu; telephone: 718-260-3505.

**Southeastern Section:** Robert J. Daverman, Department of Mathematics, University of Tennessee, Knoxville, TN 37996-1300; e-mail: daverman@novell.math.utk.edu; telephone: 423-974-6577.

The Meetings and Conferences section of the Notices gives information on all AMS meetings and conferences approved by press time for this issue. Please refer to the page numbers cited in the table of contents on this page for more detailed information on each event. Invited Speakers and Special Sessions are listed as soon as they are approved by the cognizant program committee; the codes listed are needed for electronic abstract submission. For some meetings the list may be incomplete. Information in this issue may be dated. Up-to-date meeting and conference information is available on the World Wide Web at [www.ams.org/meetings/](http://www.ams.org/meetings/).

**Important Information Regarding AMS Meetings**

Potential organizers, speakers, and hosts should refer to page 106 in the January 1999 issue of the Notices for general information regarding participation in AMS meetings and conferences.

**Abstracts**

Several options are available for speakers submitting abstracts, including an easy-to-use interactive Web form. No knowledge of LaTeX is necessary to submit an electronic form, although those who use LaTeX or AMS-LaTeX may submit abstracts with such coding. To see descriptions of the forms available, visit [http://www.ams.org/abstracts/instructions.html](http://www.ams.org/abstracts/instructions.html) or send mail to abs-submit@ams.org. Typing help as the subject line and descriptions and instructions on how to get the template of your choice will be e-mailed to you.

Completed abstracts should be sent to abs-submit@ams.org, typing submission as the subject line. Questions about abstracts may be sent to abs-info@ams.org.

Paper abstract forms may be sent to Meetings & Conferences Department, AMS, P.O. Box 6887, Providence, RI 02940. Note that all abstract deadlines are strictly enforced. Close attention should be paid to specified deadlines in this issue. Unfortunately, late abstracts cannot be accommodated.

**Conferences:** (See [http://www.ams.org/meetings/](http://www.ams.org/meetings/) for the most up-to-date information on these conferences.)

**Cospnsorred Conference:**

Representations and Cohomology
Volume 2: Cohomology of Groups and Modules
D. Benson
The heart of the book is a lengthy introduction to the representation theory of finite dimensional algebras, in which the techniques of quivers with relations and almost split sequences are discussed in some detail.
Cambridge Studies in Advanced Mathematics 31
1998 288 pp. 0-521-63652-3 Paperback $29.95

Classical Dynamics
A Contemporary Approach
Jorge V. José and Eugene J. Saletan
The authors cover all the material that one would expect to find in a standard graduate course: Lagrangian and Hamiltonian dynamics, canonical transformations, the Hamilton-Jacobi equation, perturbation methods, and rigid bodies. They also deal with more advanced topics such as the relativistic Kepler problem, Liouville and Darboux theorems, and inverse and chaotic scattering. A key feature of the book is the early introduction of geometric (differential manifold) ideas, as well as detailed treatment of topics in nonlinear dynamics (such as the KAM theorem) and continuum mechanics (including solitons). Over 200 homework exercises are included.
1998 696 pp. 0-521-63636-1 Paperback $54.95

Lie Groups, Lie Algebras, Cohomology and Some Applications in Physics
José A. De Azcárraga and José M. Izquierdo
The topics treated include the differential geometry of Lie groups, fiber bundles and connections, characteristic classes, index theorems, monopoles, instantons, extensions of Lie groups and algebras, some applications in supersymmetry, Chevalley-Eilenberg approach to Lie algebra cohomology, symplectic cohomology, jet-bundle approach to variational principles in mechanics, Wess-Zumino-Witten terms, infinite Lie algebras, the cohomological descent in mechanics and in gauge theories and anomalies. This book will be of interest to graduate students and researchers in theoretical physics and applied mathematics.
Cambridge Monographs on Mathematical Physics
1998 473 pp. 0-521-59700-5 Paperback $49.95

Mathematical Methods for Physics and Engineering
A Comprehensive Guide
K.F. Riley, M.P. Hobson, and S.J. Bence
The material covered is comprehensive, and takes the student from first year college or university to the level of the final year of most mathematical science courses. It also provides a valuable reference for active researchers in physics, engineering, chemistry, applied mathematics and earth science. The text constantly reinforces the physical relevance of the mathematics, and numerous physical work examples are included.
1998 1028 pp. 0-521-55529-9 Paperback $49.95

Finite Fields and Applications
Stephen D. Cohen and Harald Niederreiter, Editors
This book gives a state-of-the-art account of finite fields and their applications in communications (coding theory, cryptography), combinatorics, design theory, quasi-random points, algorithms and their complexity. The book also demonstrates interconnections with other branches of pure mathematics such as number theory, group theory and algebraic geometry.
London Mathematical Society Lecture Note Series 233
1996 421 pp. 0-521-56736-X Paperback $49.95

Elementary Geometry of Algebraic Curves
C.G. Gibson
From the familiar lines and conics of elementary geometry the reader proceeds to general curves in the real affine plane, with excursions to more general fields to illustrate applications, such as number theory. By adding points at infinity the affine plane is extended to the projective plane, yielding a natural setting for curves and providing a flood of illumination into the underlying geometry. A minimal amount of algebra leads to the famous theorem of Bezout, while the ideas of linear systems are used to discuss the classical group structure on the cubic.
1998 272 pp. 0-521-64641-3 Paperback $24.95

Foundations of Probability with Applications
Selected Papers 1974-1995
Patrick Suppes and Mario Zanotti
This is an important collection of essays on dealing with the foundations of probability that will be of value to philosophers of science, mathematicians, statisticians, psychologists and educationalists.
Cambridge Studies in Probability, Induction and Decision Theory
1996 202 pp. 0-521-43012-7 Hardback $64.95
0-521-56835-8 Paperback $21.95

Now in paperback...
The Logarithmic Integral I
Paul Koosis
The theme of this unique work, the logarithmic integral, lies athwart much of twentieth century analysis. It is a thread connecting many apparently separate parts of the subject, and is a natural point at which to begin a serious study of real and complex analysis. Professor Koosis’ aim is to show how, from simple ideas, one can build up an investigation that explains and clarifies many different, seemingly unrelated problems; to show, in effect, how mathematics grows. The presentation is straightforward, so this, the first of two volumes, is self-contained, but more importantly, by following the theme, Professor Koosis has produced a work that can be read as a whole. He has brought together here many results, some new and unpublished, making this a key reference for graduate students and researchers.
