$$z' = -\alpha \sin\theta \cos\theta \tan^2 \omega y'^2 + \cdots .$$

Thus we can easily obtain the following metric characterization, instead of (20), of the invariant J given by equation (19):

$$J = \left(\frac{2 \sin \omega}{3 \sin \theta}\right)^6 \frac{R^2 \bar{R}^4}{T^5 \bar{T}} .$$

THE UNIVERSITY OF WISCONSIN

A REMARK ABOUT OUR NOTE "TRANSCENDENCE OF FACTORIAL SERIES WITH PERIODIC COEFFICIENTS"[1]

VERNE E. DIETRICH AND ARTHUR ROSENTHAL

Dr. B. McMillan has called our attention to his paper *A note on transcendental numbers*, Journal of Mathematics and Physics vol. 18 (1939) pp. 28–33. Moreover, Prof. C. D. Olds has referred us to the article *On transcendental numbers* by T. Itihara and K. Ôishi, Tôhoku Math. J. vol. 37 (1933) pp. 209–221. We had not known both these papers, which are closely related to our result. In the meantime Prof. J. Popken, in his review of our note (Mathematical Reviews vol. 11 (1950) p. 331), also called attention to B. McMillan's general theorem II, but remarked: "However, McMillan's proof is not quite correct and his results need supplementing." (Concerning this see a forthcoming paper of Prof. J. Popken.) On the other hand our result does not formally follow from T. Itihara's Theorem 1 (which admits k exceptional values). But our result can indeed easily be obtained also by the method applied in the proofs of T. Itihara's Theorem 1 or B. McMillan's Theorem II. However, our method is different and more direct.
