

# ON COMPONENTS IN SOME FAMILIES OF SETS<sup>1</sup>

BRANKO GRÜNBAUM AND THEODORE S. MOTZKIN

1. **Introduction.** Helly's well-known theorem [3] states that all the members of a family  $\mathcal{C}$  of compact convex subsets of the Euclidean  $n$ -space  $E^n$  have a point in common provided every  $n+1$  members of  $\mathcal{C}$  have a common point. On the other hand (Motzkin, cf. Hadwiger-Debrunner [2] for further reference), there exists no (finite) number  $h$  with the following property: If  $\mathcal{K}$  is a family of subsets of  $E^n$  (even of  $E^1$ ) such that each member of  $\mathcal{K}$  is the union of at most two disjoint, compact, convex sets, and such that every  $h$  members of  $\mathcal{K}$  have a common point, then all the members of  $\mathcal{K}$  have a common point.

A consideration of the examples which establish the nonexistence of  $h$  led to the idea that there might exist theorems of Helly's type for such families  $\mathcal{K}$  if an additional condition is imposed on  $\mathcal{K}$ : the intersection of any two members of  $\mathcal{K}$  should also be representable as the union of at most two disjoint, compact, convex sets. The present paper contains a theorem in this direction together with related results on families  $\mathcal{K}$  whose elements are disjoint unions of members of another family  $\mathcal{C}$ .

In §2 we give the definitions of the properties we consider, and the statements of our main results. The proofs follow in §3. Remarks, examples, and counter-examples are given in §4.

2. **Definitions and results.** We shall deal mainly with families of subsets of some set, on whose nature nothing is assumed.

For a set  $A$  or an ordinal  $\mu$  we denote by  $\text{card } A$  resp.  $\text{card } \mu$  the corresponding cardinal. Thus, for a family of sets  $\mathcal{C} = \{C_\alpha : \alpha \in A\}$  we have  $\text{card } \mathcal{C} = \text{card } A$ . The letter  $\omega$  is used only for initial ordinals.

For a family of sets  $\mathcal{C} = \{C_\alpha : \alpha \in A\}$  we put  $\pi\mathcal{C} = \bigcap_{\alpha \in A} C_\alpha$  and  $\sigma\mathcal{C} = \bigcup_{\alpha \in A} C_\alpha$ .

We define  $K = C_1 + C_2$  to be an abbreviation for the statement " $K = C_1 \cup C_2$  and  $C_1 \cap C_2 = \emptyset$ ." Similarly, for  $\mathcal{C} = \{C_\alpha : \alpha \in A\}$ , we write  $K = \sum_{\alpha \in A} C_\alpha = \Sigma\mathcal{C}$  for " $K = \sigma\mathcal{C}$  and  $C_\alpha \cap C_\beta = \emptyset$  for all  $\alpha, \beta \in A$  with  $\alpha \neq \beta$ ."

If  $K = \Sigma\mathcal{C}$ , each member of  $\mathcal{C}$  is a *component* of  $K$  and  $\Sigma\mathcal{C}$  is a *decomposition* of  $K$ .

---

Presented to the Society, November 25, 1960; received by the editors September 12, 1960.

<sup>1</sup> The preparation of this paper was sponsored in part by the National Science Foundation, and by the Office of Naval Research.

For any family  $\mathcal{C}$  and any cardinal  $\gamma$  let  $[\mathcal{C}]_\gamma = \{\Sigma \mathcal{C}' : \mathcal{C}' \subset \mathcal{C}, \text{card } \mathcal{C}' < \gamma + 1\}$  and  $[\mathcal{C}] = \{\Sigma \mathcal{C}' : \mathcal{C}' \subset \mathcal{C}\}$ . For  $K \in [\mathcal{C}]$  let  $c(K) = \min \{\text{card } \mathcal{C}' : K = \Sigma \mathcal{C}', \mathcal{C}' \subset \mathcal{C}\}$ .

This paper deals with some properties of families of sets which we proceed to define.

DEFINITION 1. A family  $\mathcal{C}$  is  $\gamma$ -*intersectional* (for a finite or infinite cardinal  $\gamma \geq 1$ ) if for every subfamily  $\mathcal{C}' \subset \mathcal{C}$  with  $\text{card } \mathcal{C}' < \gamma + 1$  we have  $\pi \mathcal{C}' \in \mathcal{C}$ . The family  $\mathcal{C}$  is *intersectional* if it is  $\gamma$ -intersectional for every  $\gamma \geq 1$ .

Obviously, if  $\gamma^* \leq \gamma$  and  $\mathcal{C}$  is  $\gamma$ -intersectional, it is  $\gamma^*$ -intersectional as well. Every family is 1-intersectional; every 2-intersectional family is  $\aleph_0$ -intersectional.

DEFINITION 2. A family  $\mathcal{C}$  is  $\gamma$ -*nonadditive* (for a finite or infinite cardinal  $\gamma \geq 2$ ) if for every subfamily  $\mathcal{C}' \subset \mathcal{C}$ , with  $\emptyset \notin \mathcal{C}'$  and  $1 < \text{card } \mathcal{C}' < \gamma + 1$ , such that  $\Sigma \mathcal{C}'$  is defined, we have  $\Sigma \mathcal{C}' \notin \mathcal{C}$ . The family  $\mathcal{C}$  is *nonadditive* if it is  $\gamma$ -nonadditive for every  $\gamma \geq 2$ .

EXAMPLES. The family of all closed [open] subsets of  $E^n$  is intersectional [ $\aleph_0$ -intersectional]. The family of all connected and open [compact] subsets of  $E^n$  is nonadditive [ $\aleph_1$ -nonadditive; see [4]]. In the set of ordinals  $\{\alpha : \alpha < \omega, \text{card } \omega = k\}$ , for any  $k > \aleph_0$ , all segments of the form  $[\alpha, \beta]$  or  $[\beta, \omega)$ , where  $\alpha, \beta$  are limit-ordinals, form a family  $\mathcal{S}$  which is intersectional and nonadditive. For any set  $S$  with  $\text{card } S = k \geq \aleph_0$  the family of all subsets of  $S$  with complements of cardinal less than  $k$  is  $\aleph_0$ -intersectional and nonadditive.

DEFINITION 3. A family  $\mathcal{C}$  has the *Helly property of order  $h$  with limit  $\gamma$*  ( $h, \gamma$  cardinals with  $2 \leq h < \gamma$ ) if for each subfamily  $\mathcal{C}' \subset \mathcal{C}$ , with  $\text{card } \mathcal{C}' < \gamma + 1$ , the condition " $\pi \mathcal{C}' \neq \emptyset$  for all  $\mathcal{C}'' \subset \mathcal{C}'$ , with  $\text{card } \mathcal{C}'' < h + 1$ " implies  $\pi \mathcal{C}' \neq \emptyset$ . The family  $\mathcal{C}$  has the *unlimited Helly property of order  $h$*  if it has the Helly property of order  $h$  with limit  $\gamma$  for every  $\gamma > h$ .

EXAMPLES. The family of all compact subsets of any topological space has the unlimited Helly property of order  $\aleph_0$ . The family of convex subsets of  $E^n$  has the Helly property of order  $n + 1$  with limit  $\aleph_0$ ; that of compact convex subsets has the unlimited Helly property of order  $n + 1$  (Helly's theorem). The family of all closed segments  $[\alpha, \beta]$  of a well-ordered set has the unlimited Helly property of order 2; if segments  $[\alpha, \mu)$ , for a limit ordinal  $\mu$ , are included, the family has the Helly property of order 2 with limit card  $\mu$ .

The first theorem gives a criterion for the uniqueness of the decomposition of  $K$ .

THEOREM 1. Let  $\mathcal{C} = \{C_\alpha : \alpha \in A\}$  be 2-intersectional and  $\gamma$ -nonadditive, and  $K \in [\mathcal{C}]_\gamma$ . If  $K = \sum_{\alpha' \in A'} C_{\alpha'}$  with  $A' \subset A$ ,  $\text{card } A' < \gamma + 1$ ,

and  $C_{\alpha'} \neq \emptyset$  for all  $\alpha' \in A'$ , and if  $K = \sum_{\alpha'' \in A''} C_{\alpha''}$  with  $A'' \subset A$ ,  $\text{card } A'' < \gamma + 1$ , and  $C_{\alpha''} \neq \emptyset$  for all  $\alpha'' \in A''$ , then there exists a one-to-one map  $\phi$  from  $A'$  onto  $A''$  such that  $C_{\alpha'} = C_{\phi(\alpha')}$  for all  $\alpha' \in A'$ . In other words, the components of  $K$  are uniquely determined.

As an immediate corollary we have:

**COROLLARY.** Let  $\mathcal{C}$  be 2-intersectional and  $\gamma$ -nonadditive, and let  $K \in [\mathcal{C}]_n$  (i.e.,  $c(K) \leq n$ ), where  $n$  is a finite cardinal and  $\gamma \geq n$ . Let  $K^* \in [\mathcal{C}]_\gamma$ ,  $K \subset K^*$ , and let some  $n$  different components of  $K^*$  each have a nonempty intersection with  $K$ . Then different components of  $K$  are contained in different components of  $K^*$ , and, in particular,  $c(K) = n$ .

Obvious examples show that the corollary may fail for infinite  $n$ .

The next theorem shows that  $[\mathcal{C}]_\gamma$  is, in a sense, weakly intersectional: if the intersections of all members of certain subfamilies of  $\mathcal{K} \subset [\mathcal{C}]_\gamma$  belong to  $[\mathcal{C}]_\gamma$ , then for each subfamily of  $\mathcal{K}$  the intersection of its members belongs to  $[\mathcal{C}]_\gamma$ .

**THEOREM 2.** Let  $\mathcal{C}$  be  $\gamma$ -intersectional and  $\gamma'$ -nonadditive,  $\mathcal{K} \subset [\mathcal{C}]_\gamma$  and  $\pi\mathcal{K} \in [\mathcal{C}]_{\gamma'}$ . Then there exists a subfamily  $\mathcal{K}' \subset \mathcal{K}$ , with  $1 + \text{card } \mathcal{K}' \leq c(\pi\mathcal{K})$ , such that different components of  $\pi\mathcal{K}$  are contained in different components of  $\pi\mathcal{K}'$ ; in particular,  $c(\pi\mathcal{K}') \geq c(\pi\mathcal{K})$ .

A result of Helly's type for members of  $[\mathcal{C}]_2$  is given by

**THEOREM 3.** Let  $\mathcal{C}$  be  $\gamma$ -intersectional and  $\aleph_0$ -nonadditive, with the Helly property of order  $h$  and limit  $\gamma^*$ ,  $\gamma^* \geq \aleph_0 > h$ . Let  $\mathcal{K} \subset [\mathcal{C}]_2$  be such that  $\text{card } \mathcal{K} < \gamma + 1$  and  $K' \cap K'' \in [\mathcal{C}]_2$  for all  $K', K'' \in \mathcal{K}$ . Then  $\mathcal{K}$  has the Helly property of order  $2h$  with limit  $\gamma^*$ .

### 3. Proofs.

**PROOF OF THEOREM 1.** Obviously

$$K = \sum_{\alpha' \in A'; \alpha'' \in A''} (C_{\alpha'} \cap C_{\alpha''})$$

is a decomposition of  $K$ . If for each  $\alpha' \in A'$  and each  $\alpha'' \in A''$  either  $C_{\alpha'} \cap C_{\alpha''} = \emptyset$  or  $C_{\alpha'} \cap C_{\alpha''} = C_{\alpha'}$ , the theorem is proved. Assume on the contrary that there exists an  $\alpha'_0 \in A'$  and an  $\alpha''_0 \in A''$  such that  $C_{\alpha'_0} \cap C_{\alpha''_0}$  is neither  $\emptyset$  nor  $C_{\alpha'_0}$ . Let  $A'_0 = \{\alpha'' \in A'' : C_{\alpha'_0} \cap C_{\alpha''} \neq \emptyset\}$ . Then  $2 \leq \text{card } A'_0 < \gamma + 1$  and  $C_{\alpha'_0} = C_{\alpha'_0} \cap K = C_{\alpha'_0} \cap \sum_{\alpha'' \in A''} C_{\alpha''} = \sum_{\alpha'' \in A'_0} (C_{\alpha''} \cap C_{\alpha'_0})$ , in contradiction to the  $\gamma$ -nonadditivity of  $\mathcal{C}$ .

**PROOF OF THEOREM 2.** (i) Let  $c(\pi\mathcal{K}) \geq 2$ . Then there exist points  $x_1$  and  $x_2$  contained in different components  $C_1^*$ ,  $C_2^*$  of  $K^* = \pi\mathcal{K}$ . For some  $K_0 \in \mathcal{K}$  the points  $x_1$  and  $x_2$  are contained in different com-

ponents of  $K_0$ ; indeed, otherwise there would for each  $K \in \mathcal{K}$  exist a component  $C'$  of  $K$  with  $x_1, x_2 \in C'$ . Now  $C = \pi\{C' : K \in \mathcal{K}\} \in \mathcal{C}$  but, on the other hand,  $C = C \cap K^* \supset (C \cap C_1^*) + (C \cap C_2^*)$ , and none of the components is empty (since  $x_i \in C \cap C_i^*$ ), contradicting the  $\gamma'$ -non-additivity of  $\mathcal{C}$ . If  $c(K^*) = 2$ , it follows at once from the corollary to Theorem 1 that different components of  $K^*$  are contained in different components of  $K_0$ .

(ii) We now assume that  $c(K^*) = n$  is finite,  $n > 2$ , and that the theorem is proved for all  $n'$  with  $n' < n$ . We start as in (i) with a set  $K_0 = \sum_{\nu \in N} C_\nu \in \mathcal{K}$ , where  $\text{card } N = c(K_0) \geq 2$ , such that  $C_1 \cap K^* \neq \emptyset$  and  $C_2 \cap K^* \neq \emptyset$ . Let  $q_\nu = c(K^* \cap C_\nu) \geq 0$  for  $\nu \in N$ . By Theorem 1 we have

$$(*) \quad \sum_{\nu \in N} q_\nu = c(K^*) = n.$$

This implies that  $N_0 = \{\nu \in N : q_\nu > 0\}$  is finite and contains at most  $n$  elements. Let us assume that  $N_0 = \{1, 2, \dots, t\}$  and that the components of  $K_0$  are labeled in such a way that  $q_\nu \geq 2$  for  $1 \leq \nu \leq s$ , and  $q_\nu = 1$  for  $s < \nu \leq t$ . If  $s = 0$ , then (\*) implies  $t = n$ , and by the corollary to Theorem 1 the  $n$  components of  $K_0$  contain the  $n$  components of  $K^*$ , as claimed. Thus we are left with the case  $s \geq 1$ ; then  $2 \leq t < n$ ,  $q_1 \geq 2$  and, by the choice of  $K_0$ ,  $q_2 \geq 1$ ; therefore, by (\*),  $q_\nu < n$  for all  $\nu \in N_0$ . This allows us to apply the inductive assumption to each of the  $s$  families  $\mathcal{K}_\nu = \{C_\nu \cap K : K \in \mathcal{K}\}$ ,  $1 \leq \nu \leq s$ . It follows that for each  $\nu$ , with  $1 \leq \nu \leq s$ , there exists a subfamily  $\mathcal{K}'_\nu \subset \mathcal{K}_\nu$ , containing  $p_\nu \leq q_\nu - 1$  members, such that the different components of  $C_\nu \cap K^*$  are contained in different components of  $\pi\mathcal{K}'_\nu$ . The family  $\mathcal{K}' = \{K_0\} \cup (\bigcup_{\nu=1}^s \mathcal{K}'_\nu)$  satisfies all the conditions of the theorem. Indeed, different components of  $K^*$  are, by the corollary to Theorem 1, contained in different components of  $\pi\mathcal{K}'$ ; but on the other hand,  $\mathcal{K}'$  contains only  $1 + \sum_{\nu=1}^s p_\nu \leq 1 - s + \sum_{\nu=1}^s q_\nu = 1 - s + n - (t - s) = n + 1 - t \leq n - 1 < c(K^*)$  members.

(iii) There remains the case in which  $k = c(K^*)$  is infinite. Let  $\omega$  be the initial ordinal of  $k$  and let  $K^* = \pi\mathcal{K} = \sum_{\nu < \omega} C_\nu^*$ . For each  $\nu < \omega$  let  $x_\nu \in C_\nu^*$ . As in (i), for each pair  $\nu, \mu < \omega$  with  $\nu \neq \mu$  there exists some  $K_{\nu, \mu} \in \mathcal{K}$  such that  $x_\nu$  and  $x_\mu$  are contained in different components of  $K_{\nu, \mu}$ . Let  $\mathcal{K}' = \{K_{\nu, \mu} : \nu, \mu < \omega\}$ . Then  $\text{card } \mathcal{K}' \leq (\text{card } \omega)^2 = k$ . For the family  $\mathcal{K}'$  we have  $c(\pi\mathcal{K}') \geq k$  since  $x_\nu$  and  $x_\mu$  belong to different components of  $\pi\mathcal{K}'$ . By an argument similar to that used in the proof of Theorem 1 it follows that different components of  $K^*$  are contained in different components of  $\pi\mathcal{K}'$ . This ends the proof of Theorem 2.

PROOF OF THEOREM 3. For some fixed  $h$  assume the theorem false; let  $k$  be the minimal cardinal for which there exists a family with card  $\mathcal{K} = k$  contradicting the theorem.

(i) Assume  $k$  finite. Then for each  $K^* \in \mathcal{K}$  we have  $\pi\{K \in \mathcal{K}: K \neq K^*\} \neq \emptyset$ . Let  $\mathcal{K}_i = \{K \in \mathcal{K}: c(K) = i\}$  for  $i = 1, 2$ , and let  $K = C_1 + C_2$  for all  $K \in \mathcal{K}_2$ . We assume that  $\mathcal{K}$  is chosen in such a way that  $\text{card } \mathcal{K}_1 + 2 \text{ card } \mathcal{K}_2$  (the total number of components of members of  $\mathcal{K}$ ) is minimal. This implies that for each  $K' \in \mathcal{K}_2$  and  $i = 1, 2$ , there exists a  $K^0 = K^0(C'_i) = K^0(K', i) \in \mathcal{K}$  such that  $\pi\{K \in \mathcal{K}: K \neq K^0\} \subset C'_i$ .

We shall show that  $C'_i \cap K \neq \emptyset$  for all  $K' \in \mathcal{K}_2, K \in \mathcal{K}$ , and  $i = 1, 2$ . Let us assume, to the contrary, that there exists  $K' \in \mathcal{K}_2, K_0 \in \mathcal{K}$  and  $i = 1$  or  $2$  such that  $C'_i \cap K_0 = \emptyset$ . (Without loss of generality we shall assume  $i = 1$ .) Since  $\emptyset \neq \pi\{K \in \mathcal{K}: K \neq K^0(K', 1)\} \subset C'_i$ , it follows that  $K_0 = K^0 = K^0(K', 1)$ . Then  $C'_i \cap K \neq \emptyset$  for all  $K \neq K^0$ ; also  $C'_2 \cap K \neq \emptyset$  for all  $K \in \mathcal{K}$ , since otherwise  $K' \cap K \cap K^0 \subset (C'_1 \cap K^0) \cup (C'_2 \cap K) = \emptyset$  would contradict the assumption that any  $3 < 4 \leq 2h$  members of  $\mathcal{K}$  have a nonempty intersection. Therefore, for each  $K \neq K^0, c(K' \cap K) = 2$ ; hence, for some component  $C_j$  of  $K$  we have  $K \cap C'_2 = C_j \cap C'_2$ . Now

$$\begin{aligned} \pi\{C_j: K \in \mathcal{K}, K \neq K^0\} &= C'_2 \cap \pi\{C_j: K \in \mathcal{K}, K \neq K^0\} \\ &= C'_2 \cap \pi\{K \in \mathcal{K}: K \neq K^0\} \subset C'_1 \cap C'_2 = \emptyset. \end{aligned}$$

Since  $\mathcal{C}$  has the Helly property of order  $h$  it follows that for some subset  $\mathcal{K}_0$  of  $\mathcal{K}$ , such that  $K^0 \notin \mathcal{K}_0$  and with  $\text{card } \mathcal{K}_0 = h_0 \leq h$ , we have  $\pi\{C_j: K \in \mathcal{K}_0\} = \emptyset$ . For the family  $\mathcal{K}^* = \{K', K^0\} \cup \mathcal{K}_0$  we have therefore  $\pi\mathcal{K}^* \subset (C'_1 \cap K^0) \cup (C'_2 \cap \pi\mathcal{K}_0) = \emptyset$ , although  $\text{card } \mathcal{K}^* \leq h_0 + 2 \leq h + 2 \leq 2h$ . This contradiction establishes our assertion.

Next, let  $K^* \in \mathcal{K}_2$  be chosen arbitrarily. For each  $K \in \mathcal{K}_2$  it follows from the above and from  $c(K^* \cap K) \leq 2$  that  $c(K^* \cap K) = 2$  and that different components of  $K$  intersect different components of  $K^*$ . Let the components of  $K$  be re-labeled, if necessary, in such a way that  $C_i^* \cap C_i \neq \emptyset$  for  $i = 1, 2$ . We claim that for all  $K', K'' \in \mathcal{K}_2$  we have  $C'_i \cap C'_i \neq \emptyset, i = 1, 2$ . Indeed, otherwise we would have (since each component of one set intersects every other set),  $C'_1 \cap C'_1 = C'_2 \cap C'_2 = \emptyset$ , and therefore  $K^* \cap K' \cap K'' = \emptyset$ , which is impossible. Thus, for any  $K', K'' \in \mathcal{K}_2$ ,

$$C'_i \cap C'_j \begin{cases} = \emptyset & \text{if } i \neq j \\ \neq \emptyset & \text{if } i = j. \end{cases}$$

Now we consider the families  $\mathcal{C}_i = \mathcal{K}_1 \cup \{C_i: K \in \mathcal{K}_2\}$  for  $i = 1, 2$ . The assumption  $\pi\mathcal{K} = \emptyset$  implies that  $\pi\mathcal{C}_i = \emptyset$  for  $i = 1, 2$ . Since  $\mathcal{C}_i \subset \mathcal{C}$ ,

there exist  $h$  or less members of  $\mathcal{C}_i$  whose intersection is empty,  $i=1, 2$ . But then the intersection of the corresponding members of  $\mathcal{K}$  is also empty, although it involves at most  $2h$  members of  $\mathcal{K}$ . The contradiction reached proves the theorem for finite  $k$ .

(ii) Let  $k$  be infinite,  $k < \gamma^*$ , and the theorem true for all families with less than  $k$  members. Let  $\omega$  be the initial ordinal of  $k$ , let  $A$  be the set of ordinals  $A = \{\alpha: \alpha < \omega\}$ , and let  $\mathcal{K} = \{K_\alpha: \alpha < \omega\}$ . By the inductive assumption we have  $\bigcap_{\alpha < \mu} K_\alpha \neq \emptyset$  for each  $\mu < \omega$ . If for some  $K_\alpha$  one of its components does not intersect some  $K_\beta$ , we omit this component and take the other component to be the new  $K_\alpha$ . By the inductive assumption, the new  $K_\alpha$  satisfy  $\bigcap_{\alpha < \mu} K_\alpha \neq \emptyset$  for all  $\mu < \omega$ . From here on we proceed as in the final part of (i): we re-label (if necessary) the components of some  $K_\alpha$  with  $c(K_\alpha) = 2$ , construct the families  $\mathcal{C}_i$  and derive a contradiction from the assumption that  $\bigcap_{\alpha < \omega} K_\alpha = \emptyset$ . This terminates the proof of Theorem 3.

**4. Remarks.** 1. Theorem 2 fails if  $\text{card } \pi\mathcal{K}$  is infinite and  $\mathcal{K}'$  is assumed to satisfy  $\text{card } \mathcal{K}' < \text{card } \pi\mathcal{K}$ . E.g., starting from the family  $\mathcal{S}$  (preceding Definition 3), with  $\text{card } \omega = k > \aleph_0 = \text{card } \omega_0$ , let  $\mathcal{K} = \{[\omega_0, \alpha] \cup [\alpha + \omega_0, \omega): \alpha \text{ limit ordinal } < \omega\}$ . Then  $c(\pi\mathcal{K}) = k$ , but the intersection of any  $k' < k$  members of  $\mathcal{K}$  has only  $k'$  components. Similar examples are easily found for  $c(\pi\mathcal{K}) = \aleph_0$ .

2. Probably the most interesting immediate application of Theorem 3 is to convex sets in  $E^n$ . To satisfy the condition of nonadditivity we may consider, e.g., families consisting only of closed (or only of open) convex sets. The following example shows that Theorem 3 does not hold if  $\mathcal{C}$  is, e.g., the family of all convex sets in  $E^2$ . (Simple examples of a similar nature show the necessity of nonadditivity assumptions in Theorem 2.) Let  $D$  denote a closed disc with center 0. Let  $K_0$  be obtained from  $D$  by deleting 0. Let  $x_i, i=1, 2, \dots, 6$ , be equidistant points on the boundary of  $D$ , ( $x_i = x_{i+6}$ ). For each  $i, 1 \leq i \leq 6$ , let  $K_i$  be obtained from  $D$  by deleting the open small arc of  $\text{Bd } D$  determined by  $x_{i-1}$  and  $x_{i+1}$ , and the open sector determined by these two points and 0. Then each  $K_i, 0 \leq i \leq 6$ , as well as the intersection of any two  $K_i$ , is the disjoint union of two convex sets, and any six  $K_i$  have a nonempty intersection. Nevertheless,  $\bigcap_{i=0}^6 K_i = \emptyset$ . As is easily verified, the same reasoning applies to the case where 7 or 8 equidistant points are chosen on  $\text{Bd } D$ . We conjecture that for the family of all convex sets in  $E^2$  a result analogous to Theorem 3 holds, with 9 instead of  $2h$ .

3. The following statement (with obvious refinements) is conjectured: If  $\mathcal{C}$  is an intersectional and nonadditive family with un-

limited Helly property of order  $h$  and if  $\mathcal{K} \subset [\mathcal{C}]_n$  is such that the intersection of any 2, 3,  $\dots$ ,  $n$  members of  $\mathcal{K}$  also belongs to  $[\mathcal{C}]_n$  then  $\mathcal{K}$  has the unlimited Helly property of order  $nh$ . Simple examples show that  $nh-1$  may not be substituted for  $nh$  in this conjecture. If  $\mathcal{C}$  is the family of segments in  $E^1$ , the conjecture is easily provable.

4. Let  $\mathcal{C}^{(n)}$  denote the family of all compact, convex subsets of  $E^n$ ; in [1], a function  $\Delta(K)$ , with  $0 \leq \Delta(K) \leq +\infty$ , was defined for all compact sets  $K \subset E^n$  in such a way that  $\Delta(K) < \infty$  if and only if  $K \in [\mathcal{C}^{(n)}]_{\aleph_0}$ . Theorem 2 of [1] may be formulated as follows: For any finite  $n \geq 1$  and real  $d < \infty$  there exists a finite  $h = h(n, d)$  such that the family  $\{K \in [\mathcal{C}^{(n)}]_{\aleph_0} : \Delta(K) \leq d\}$  has the unlimited Helly property of order  $h$ . By applying the methods of [1] it may be shown that for each finite  $n \geq 1$  and  $d < \infty$  there exists a finite  $k = k(n, d)$  such that  $\Delta(K) \leq d$  implies  $K \in [\mathcal{C}^{(n)}]_k$ .
