A NOTE ON EXTREME ELEMENTS IN $A_0(K, E)$

M. SHARIR

ABSTRACT. We give a short and simple proof to a theorem of Fakhouri, characterizing extreme elements in the unit ball of $A_0(K, E)$.

Let $V$ be a Banach space whose dual is an $L^1$-space. Denote by $K$ the unit ball of $V^*$ equipped with the $w^*$-topology. Let $E$ be a Banach space. $S(E)$ will denote its closed unit ball and $\text{ext } S(E)$ the set of extreme points in $S(E)$. $A_0(K, E)$ will be the Banach space of all the symmetric affine functions from $K$ into $E$, continuous in the $w^*$-topology on $K$, and in the norm topology on $E$. Fakhouri has shown in [1] that if $E$ has certain properties, then $f \in A_0(K, E)$ is extreme in $S(A_0(K, E))$ if and only if $f(\text{ext } K) \subseteq \text{ext } S(E)$. This result bears immediate characterization of extreme compact operators (if $E = F^*$, then $A_0(K, E)$ is precisely the space of compact operators from $F$ into $V$), and generalizes similar results of Lazar [2]. By observing a simple property of spaces having the 3.2.1.P. (cf. [4] for a proper definition), and by using a selection theorem of Lazar and Lindenstrauss [3], we are able to prove Fakhouri's result in a very simple and direct way.

Lemma. Let $E$ be a Banach space having the 3.2.1.P. and let $x, y \in S(E)$, $a \in E$, such that $x \pm a \in S(E)$. Then there exists an element $b \in E$, such that $y \pm b \in S(E)$, and $\|b - a\| \leq \|y - x\|$.

Proof. Define three closed balls in $E$:

- $S_1 = \{b \in E; \|b - y\| \leq 1\}$,
- $S_2 = \{b \in E; \|b + y\| \leq 1\}$,
- $S_3 = \{b \in E; \|b - a\| \leq \|y - x\|\}$.

These balls intersect in pairs, for $0 \in S_1 \cap S_2$, $y + a - x \in S_1 \cap S_3$ and

EXTREME ELEMENTS IN $A_0(K, E)$

- $y + a + x \in S_2 \cap S_3$. Hence they have a nonempty intersection, and any $b \in S_1 \cap S_2 \cap S_3$ has all the desired properties.

Theorem. Let the scalars be real, and let $E$ be a Banach space with the 3.2.I.P. and let $K$ be as above. Then an element $\phi$ of $A_0(K, E)$ is extreme in the unit ball of this space if and only if $\phi(\text{ext } K) \subset \text{ext } S(E)$.

Proof. Since one direction is immediate, assume $\phi$ to be extreme. We make use of a selection theorem of Lazar and Lindenstrauss [3]. Define a set-valued mapping $\Sigma: K \to 2^{S(E)}$ by

$$\Sigma(\mu) = \{x \in S(E); \|\phi(\mu) + x\| \leq 1\}, \quad \mu \in K.$$  

Now, for each $\mu \in K$, $\Sigma(\mu)$ is a norm-closed convex nonvoid subset of $S(E)$. Also $\Sigma(-\mu) = \Sigma(\mu)$ for each $\mu \in K$ (thus $\Sigma$ is symmetric), and for each $\mu_1, \mu_2 \in K, 0 \leq \alpha \leq 1$, we have

$$\alpha \Sigma(\mu_1) + (1 - \alpha)\Sigma(\mu_2) \subset \Sigma(\alpha\mu_1 + (1 - \alpha)\mu_2)$$

(thus $\Sigma$ is convex). $\Sigma$ is also lower semicontinuous (in the sense of Michael [5]) with the $w^*$-topology on $K$ and the norm-topology on $S(E)$: Let $\mu \in K$, $x \in \Sigma(\mu)$, and $\mu_\alpha \overset{w^*}{\to} \mu$ in $K$. We have to show the existence of $x_\alpha \in \Sigma(\mu_\alpha)$, for each $\alpha$, such that $x_\alpha \to x$ in norm. But this is immediate since $\phi(\mu_\alpha) \to \phi(\mu)$ in norm, and, for each $\alpha$, the Lemma provides us with a $x_\alpha \in E$ such that $\|\phi(\mu_\alpha) + x_\alpha\| \leq 1$ (hence $x_\alpha \in \Sigma(\mu_\alpha)$) and $\|x_\alpha - x\| \leq \|\phi(\mu_\alpha) - \phi(\mu)\|$. Hence the lower semicontinuity of $\Sigma$ is obvious. Now, assume that $\phi(\text{ext } K) \not\subset \text{ext } S(E)$. Hence, there is a $\mu_0 \in \text{ext } K$ and a nonzero element $x_0$ of $\Sigma(\mu_0)$. Now, $f(\alpha\mu_0) = \alpha x_0, \alpha \in [-1, 1]$, is a $w^*$-continuous affine symmetric selection of $\Sigma$ restricted to $\text{conv}(\{\mu_0\}U - \{\mu_0\})$, for which $\{\mu_0\}$ is obviously essentially closed (cf. [3] for proper definitions). Hence, there is a $w^*$-continuous affine symmetric selection $\psi \in A_0(K, E)$ of $\Sigma$, such that $\psi(\mu_0) = x_0 \neq 0$. Hence, for each $\mu \in K$ one has $\|\phi(\mu) \pm \psi(\mu)\| \leq 1$ and therefore $\|\phi \pm \psi\| \leq 1$. Since $\phi$ is extreme we must have $\psi = 0$, a contradiction which completes the proof.

Remark. The estimate $\|x_\alpha - x\| \leq \|\phi(\mu_\alpha) - \phi(\mu)\|$, and therefore also the requirement that $E$ will have the 3.2.I.P., is apparently too strong for the proof of the Theorem and weaker assumptions will do as well.
