BOUNDDED MULTIPLIER CONVERGENCE IN MEASURE OF RANDOM VECTOR SERIES

C. RYLL-NARDZEWSKI AND W. A. WOYCZYŃSKI

ABSTRACT. If the series $\sum f_i$ of random vectors with values in a Banach space converges unconditionally in measure, then, for each $(\lambda_i) \in l^\infty$, the series $\sum \lambda_i f_i$ also converges unconditionally in measure.

Recall that the series of elements of a topological group is said to be unconditionally convergent if it remains convergent after arbitrary permutation of its terms. The following proposition is, essentially, a classical result due to Orlicz (cf. also [2, Theorem 1]).

**Proposition 1.** Let $(x_i)$ be a sequence of elements of a sequentially complete topological abelian group. Then the series $\sum x_i$ converges unconditionally if and only if for every sequence of $\epsilon_i = \pm 1$ the series $\sum \epsilon_i x_i$ converges.

Now, let $(\mathcal{X}, \| \cdot \|)$ be a Banach space and let $(T, \mathcal{A}, \mu)$ be a probability system. By definition $L^0(T, \mathcal{A}, \mu; \mathcal{X}) = L^0(\mathcal{X})$ is the linear complete metric space of all measurable functions on $(T, \mathcal{A}, \mu)$ with values in $\mathcal{X}$ (i.e. $\mu$-a.e. limits of simple functions) equipped with the quasi-norm

$$\|f\|_0 = \min \{c : c^{-1} \mu \{ t : \|f(t)\| > c \} \leq 1 \}.$$  

**Theorem 1.** If for all choices of $\epsilon_i = \pm 1$ the series $\sum \epsilon_i f_i$, $f_i \in L^0(\mathcal{X})$, converges in $L^0(\mathcal{X})$ then also for each sequence $(\lambda_i) \in l^\infty$ the series $\sum \lambda_i f_i$ converges in $L^0(\mathcal{X})$.

In the special case $\mathcal{X} = \mathbb{R}$ this theorem was obtained by Maurey and Pisier [1] but our method of proof is much shorter and more elementary. Proposition 1 and Theorem 1 give us immediately the following theorem which confirms a long-standing conjecture (cf. [3, Problem III.6.8]).

**Theorem 2.** If $f \in L^0(\mathcal{X})$, unconditional convergence of the series $\sum f_i$ is equivalent to convergence of all the series $\sum \lambda_i f_i$, $(\lambda_i) \in l^\infty$.

Notice that Theorem 2 may be used as a tool in constructing an integral of any bounded real measurable function with respect to the bounded (random) measure with values in $L^0(\mathcal{X})$ (cf. [3, Theorem III.6.2]). For integrals with
respect to random measures with independent values on disjoint sets more information is available from [4].

Proof of Theorem 1. By [2, Lemma 2], given the sequence $\lambda = (\lambda_i)$, $|\lambda_i| \leq 1$, for each sequence $(x_i) \subset X$ and arbitrary $n \in \mathbb{N}$, we have the inequality

$$\mathbb{P}\left\{ (\varepsilon_i) : \left| \sum_{i=1}^{n} \varepsilon_i x_i \right| > \frac{1}{8} \left| \sum_{i=1}^{n} \lambda_i x_i \right| \right\} \geq \frac{1}{8},$$

where $\mathbb{P} = (P_0 + P_\lambda)/2$, and $P_\lambda$ is the probability on $\{-1, +1\}^\mathbb{N}$ such that the random variables $\{-1, +1\}^\mathbb{N} \ni (\varepsilon_i) \rightarrow \varepsilon_j$, $j = 1, 2, \cdots$, are independent and $\int \varepsilon_i \, dP_\lambda = \lambda_i$. Now, given the sequence $(f_i) \subset L^q(\mathcal{X})$, for each $t \in T$, we have that

$$\mathbb{P}\left\{ (\varepsilon_i) : \left| \sum_{i=1}^{n} \varepsilon_i f_i(t) \right| > \frac{1}{8} \left| \sum_{i=1}^{n} \lambda_i f_i(t) \right| \right\} \geq \frac{1}{8}, \quad n \in \mathbb{N}.$$

Integrating this inequality with respect to the measure $\mu$ we get that

$$(\mu \times \mathbb{P})\left\{ (t, (\varepsilon_i)) : \left| \sum_{i=1}^{n} \varepsilon_i f_i(t) \right| > \frac{1}{8} \left| \sum_{i=1}^{n} \lambda_i f_i(t) \right| \right\} \geq \frac{1}{8}, \quad n \in \mathbb{N}.$$

By the Fubini theorem (notice that $\max$ is taken over the finite set)

$$(1) \quad \max_{(\varepsilon_i)} \mu\left\{ t : \left| \sum_{i=1}^{n} \varepsilon_i f_i(t) \right| > \frac{1}{8} \left| \sum_{i=1}^{n} \lambda_i f_i(t) \right| \right\} \geq \frac{1}{8}, \quad n \in \mathbb{N}.$$

Now, let

$$T_1 \overset{df}{=} \left\{ t : \frac{1}{8} \left| \sum_{i=1}^{n} \lambda_i f_i(t) \right| > c \right\}, \quad c > 0,$$

and $\mu(T_1) > 0$. Put $\mu_1(A) \overset{df}{=} \mu(A \cap T_1)/\mu(T_1)$, $A \in \mathcal{A}$. Applying (1) to the measure $\mu_1$ (instead of $\mu$) we have that

$$\max_{(\varepsilon_i)} \mu_1\left\{ t : \left| \sum_{i=1}^{n} \varepsilon_i f_i(t) \right| > c \right\} \geq \max_{(\varepsilon_i)} \mu\left\{ t : \left| \sum_{i=1}^{n} \varepsilon_i f_i(t) \right| > \frac{1}{8} \left| \sum_{i=1}^{n} \lambda_i f_i(t) \right| \right\} \geq \frac{1}{8}, \quad n \in \mathbb{N},$$

and, eventually, by definition of $\mu_1$, we get that

$$(2) \quad \max_{(\varepsilon_i)} \mu\left\{ t : \left| \sum_{i=1}^{n} \varepsilon_i f_i(t) \right| > c \right\} \geq \frac{1}{8} \mu\left\{ t : \left| \sum_{i=1}^{n} \lambda_i f_i(t) \right| > 8c \right\}, \quad n \in \mathbb{N},$$

which concludes the proof of Theorem 1.
Notice that inequality (2) implies that for each $c > 0$

$$\left\{ c : \frac{1}{c} \max_{\varepsilon_i} \mu \left\{ t : \left\| \sum_{i=1}^{n} \varepsilon_i f_i(t) \right\| > c \right\} \leq 1 \right\}$$

$$\subseteq \left\{ \frac{1}{8} c : \frac{1}{c} \mu \left\{ t : \left\| \sum_{i=1}^{n} \lambda_i f_i(t) \right\| > c \right\} \leq 1 \right\},$$

and that the above inclusion and the definition of the quasi-norm $\| \cdot \|_0$ give us also the following quantitative result.

**Theorem 3.** Let $(f_i) \subset L^0(\mathcal{F})$ and $(\lambda_i) \in l^\infty$, $|\lambda_i| \leq 1$. Then for each $n \in \mathbb{N}$

$$\left\| \sum_{i=1}^{n} \lambda_i f_i \right\|_0 \leq 3 \max_{\varepsilon_i} \left\| \sum_{i=1}^{n} \varepsilon_i f_i \right\|_0.$$
