ON SCHOLZ'S RECIPROCITY LAW

KENNETH S. WILLIAMS

ABSTRACT. An elementary proof is given of a reciprocity law proved by Scholz using class-field theory.

In this note we shall be concerned with distinct primes $p \equiv 1 \pmod 4$ and $q \equiv 1 \pmod 4$, which are quadratic residues of one another, so that we can regard $\sqrt{q}$ as an integer modulo p. We let ε_q denote the fundamental unit of the real quadratic field $Q(\sqrt{q})$. Although $\sqrt{q}$ is only defined modulo p up to sign, nevertheless, the Legendre symbol $(\frac{\varepsilon_q}{p})$ is uniquely defined, as ε_q has norm -1 and $(\frac{-1}{p}) = 1$. Moreover, since $(\frac{q}{p}) = 1$, we can define $(\frac{q}{p})_4$ to be $+1$ or -1, according as q is or is not a fourth power (mod p). In 1934, Scholz [4] proved the following reciprocity law using class-field theory, namely,

$$\left(\frac{p}{q}\right)_4\left(\frac{q}{p}\right)_4 = \left(\frac{\varepsilon_q}{p}\right) = \left(\frac{\varepsilon_p}{q}\right). \tag{1}$$

In 1971, Lehmer [3] gave a proof of (1), using Dirichlet's formula for the class number of the real quadratic field $Q(\sqrt{q})$ and some facts from cyclotomy. Another proof, using spinor genera, has been given by Estes and Pall [2]. It is the purpose of this note to give an elementary proof, which depends essentially only on manipulation of Jacobi symbols and Jacobi's law of quadratic reciprocity.

We set

$$\lambda = \begin{cases} 1, & \text{if } q \equiv 1 \pmod 8, \\ 3, & \text{if } q \equiv 5 \pmod 8. \end{cases}$$

It is well known that there are positive integers T and U such that

$$\varepsilon_q^{\lambda} = T + U\sqrt{q}, \qquad T \equiv 0 \pmod 2, \qquad U \equiv 1 \pmod 4.$$

Moreover, as $(\frac{q}{p}) = 1$, there are positive coprime integers u and v, with u odd, such that $p^{\lambda h} = u^2 - 4qv^2$, where $h \equiv 1 \pmod 2$ is the class number of $Q(\sqrt{q})$ (see for example [1, Theorem 1, p. 184 and Theorem 6, p. 187]). Then, as $u/2v \equiv \sqrt{q} \pmod p$, we have

$$\left(\frac{\varepsilon_q}{p}\right) = \left(\frac{\varepsilon_q^{\lambda}}{p}\right) = \left(\frac{T + U\sqrt{q}}{p}\right) = \left(\frac{T + U(u/2v)}{p}\right)$$

$$= \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{Uu + 2Tv}{p}\right) = \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{p}{Uu + 2Tv}\right)$$

$$= \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{p^{\lambda h}}{Uu + 2Tv}\right) = \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{u^2 - 4qv^2}{Uu + 2Tv}\right)$$

$$= \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{U^2u^2 - 4qU^2v^2}{Uu + 2Tv}\right) = \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{4T^2v^2 - 4qU^2v^2}{Uu + 2Tv}\right)$$

$$= \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{T^2 - qU^2}{Uu + 2Tv}\right) = \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{-1}{Uu + 2Tv}\right)$$

$$= \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{-1}{u}\right)$$

$$= \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{p^{\lambda h}q}{u}\right) = \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{p}{u}\right)\left(\frac{q}{u}\right) = \left(\frac{2}{p}\right)\left(\frac{v}{p}\right)\left(\frac{u}{p}\right)\left(\frac{u}{q}\right)$$

$$= \left(\frac{2}{p}\right)\left(\frac{(uv)^2}{p}\right)_4\left(\frac{u^2}{q}\right)_4 = \left(\frac{2}{p}\right)\left(\frac{4q}{p}\right)_4\left(\frac{p^{\lambda h}}{q}\right)_4$$

$$= \left(\frac{2}{p}\right)\left(\frac{2}{p}\right)\left(\frac{q}{p}\right)_4\left(\frac{p}{q}\right)_4 = \left(\frac{p}{q}\right)_4\left(\frac{q}{p}\right)_4,$$

as required.

The author acknowledges some suggestions of the referee which enabled him to shorten his original proof.
