

SIMPLE EXAMPLE OF NONUNIQUENESS FOR A DUAL TRIGONOMETRIC SERIES

ROBERT B. KELMAN

ABSTRACT. A simple nonzero solution is given for the classic homogeneous dual trigonometric equation having the kernel $\{\sin(n + 1/2)x\}$. The solution's rate of growth is minimal.

Dual orthogonal series are closely connected with mixed boundary value problems. In such applications the coefficients in the orthogonal function expansions are not necessarily "small", since the functions they represent possess singularities intrinsic to the physical phenomena being modelled. As a result, uniqueness for dual expansions is of unusual practical as well as mathematical importance, and, in fact, the first example of nonuniqueness was given by Srivastav [3] in his studies of Griffith cracks. The known examples of nonuniqueness are complicated [1], [3]. In this note an observation allows us to present a simple and rigorous nonzero solution of minimal growth rate to the dual equation

$$\lim_{r \rightarrow 1-0} \sum_{n=0}^{\infty} \left[\frac{a_n}{n + 1/2} \sin(n + 1/2)x \right] r^n = 0, \quad 0 < x < c, \quad (1A)$$

$$\lim_{r \rightarrow 1-0} \sum_{n=0}^{\infty} [a_n \sin(n + 1/2)x] r^n = 0, \quad c < x < \pi. \quad (1B)$$

Mathematically such examples are used in establishing sharp bounds on growth rates for coefficients needed to insure uniqueness.

In [1] it was shown that $a_n \equiv 0$ is the only solution to (1A, B) satisfying

$$\sum_0^N |a_n| = o(N^{3/2}). \quad (2)$$

Here we shall show that $b_n = (n + 1/2)P_n(\cos c)$ is a solution to (1A, B) where P_n is a Legendre polynomial. Note that $\sum_0^N |b_n| = O(N^{3/2})$, since $P_n(\cos c) = O(n^{-1/2})$. Thus $\{b_n\}$ has minimal rate of growth.

We recall [2, p. 299] the Fourier expansion for the Lebesgue integrable function on the left:

$$[2(\cos x - \cos c)]^{-1/2} = \sum_{n=0}^{\infty} P_n(\cos c) \exp\{i(n + 1/2)x\},$$

$$0 \leq x < \pi, x \neq c. \quad (3)$$

Using the imaginary terms in (3) for $x \in [0, c)$ and the regularity of Abel summation we get (1A). Now use the real terms in (3) for $x \in (c, \pi]$. Applying Fatou's theorem [4, p. 99] on the Abel summability of formally differentiated Fourier series we obtain (1B).
