

CONVERGENCE ESTIMATES OF GALERKIN-WAVELET SOLUTIONS TO A CAUCHY PROBLEM FOR A CLASS OF PERIODIC PSEUDODIFFERENTIAL EQUATIONS

NGUYEN MINH CHUONG AND BUI KIEN CUONG

(Communicated by David R. Larson)

ABSTRACT. A class of Cauchy problems for interesting complicated periodic pseudodifferential equations is considered. By the Galerkin-wavelet method and with weak solutions one can find sufficient conditions to establish convergence estimates of weak Galerkin-wavelet solutions to a Cauchy problem for this class of equations.

1. INTRODUCTION

The theory of pseudodifferential operators has been extremely intensively developing. This is so, not only because it is a very general theory including many theories, especially because it is of great interest and difficulty, but also because it is an extremely powerful tool for studying linear and nonlinear problems (see [3], [5]–[7], [11], [12], [16], [19], [21], [22] and references therein). Wavelet theory is growing very rapidly as well (see [1]–[4], [8]–[15], [17], [18], [20] and references therein). Wavelet approximation methods, however, for even only pseudodifferential operators (not a Cauchy problem) are investigated in a very few works [2], [10], [13], [14], [18].

In this paper we study approximately a Cauchy problem for a class of interesting complicated pseudodifferential equations as follows:

$$(1.1) \quad \frac{\partial u}{\partial t} = -\mu Au(x, t) - \int_0^t a(t - \tau) Au(x, \tau) d\tau + b(x, t),$$

$$(1.2) \quad u(x, 0) = u_0(x)$$

where $x \in \mathcal{J}^n = \mathbb{R}^n / \mathbb{Z}^n$, $\mu > 0$, $A = \sigma(D)$ is a pseudodifferential operator, defined by

$$\sigma(D)u(x) = \sum_{\xi \in \mathbb{Z}^n} e^{2\pi i x \xi} \sigma(\xi) \tilde{u}(\xi), u \in C^\infty(\mathbb{Z}^n),$$

with symbol $\sigma(\xi)$ belonging to $S^{2m}(\mathbb{Z}^n)$, i.e. $\sigma \in C^\infty(\mathbb{Z}^n)$ satisfying

$$|\Delta^\alpha \sigma(\xi)| \leq C_\alpha (1 + |\xi|)^{2m - |\alpha|} \text{ for all } \xi \in \mathbb{Z}^n \text{ and for all multi-indexes } \alpha,$$

Key words and phrases. Convergence estimates, weak Galerkin-wavelet solution, Cauchy problem, periodic pseudodifferential equations.

and Δ is the difference operator, which is defined by $\Delta := (\tau_1 - 1, \tau_2 - 1, \dots, \tau_n - 1)^T$, where $\tau_j f(x) := f(x + e^j)$, $e^j = (\delta_{j,l})_{l=1}^n$ is the j th coordinate vector.

Here it is assumed also that $\sigma \in C^\infty(\mathbb{R}^n \setminus \{0\})$ and $\sigma(t\xi) = t^{2m}\sigma(\xi)$, $t > 0$, $\sigma(0) = 1$. Moreover

$$(1.3) \quad \sigma(\xi) \geq c(1 + |\xi|^2)^m, |\xi| \geq R > 0.$$

The functions $a(t), b(x, t)$ are given. Note that when $\mu = 0$, under some assumptions on $a(t)$ the type of equation (1.1) may be changed.

To establish some convergence estimates for this complicated problem, in order to overcome the difficulties, let us use the Galerkin-wavelet method and weak solutions and approximative weak solutions, with the very effective tools: the Fourier and Laplace transforms.

2. NOTATION AND PRELIMINARIES

Let us recall here some usual notation, definitions and some basic facts.

For a function $u(x) \in L_2(\mathcal{J}^n)$, the discrete Fourier transform is defined by

$$\mathcal{F}(u)(\xi) = \tilde{u}(\xi) := \int_{\mathcal{J}^n} e^{-2\pi i x \xi} u(x) dx = \int_{[0,1]^n} e^{-2\pi i x \xi} u(x) dx, \quad \xi \in \mathbb{Z}^n.$$

The discrete inverse Fourier transform is then $u(x) := \sum_{\xi \in \mathbb{Z}^n} \tilde{u}(\xi) e^{2\pi i x \xi}$.

The Fourier transform of the function $f \in L_2(\mathbb{R}^n)$ is

$$\hat{f}(\xi) = \int_{\mathbb{R}^n} e^{-2\pi i x \xi} f(x) dx, \quad \xi \in \mathbb{R}^n$$

with the inverse Fourier transform $f(x) = \int_{\mathbb{R}^n} e^{2\pi i x \xi} \hat{f}(\xi) d\xi$, $x \in \mathbb{R}^n$.

The Laplace transform of a function $u(x)$ increasing less than an exponent is $L(u)(s) = \check{u}(s) := \int_0^\infty e^{-2\pi s t} u(t) dt$, $s \in \mathbb{C}$. Below will be listed some usual simple properties of the Laplace transform,

$$(2.1) \quad L(a * u)(s) = L(a)(s).L(u)(s),$$

where

$$(a * u)(t) = \int_0^t a(t - \tau)u(\tau) d\tau,$$

(2.2)

$$L(u^{(k)})(s) = -u^{(k-1)}(0) - 2\pi s u^{(k-2)}(0) - \dots - (2\pi s)^{(k-1)} u(0) + (2\pi s)^k \check{u}(s),$$

$$(2.3) \quad \int_{-\infty}^{+\infty} \check{u}(s_0 + i\delta) \overline{\check{v}(s_0 + i\delta)} d\delta = \int_0^{+\infty} e^{-4\pi s_0 t} u(t) \overline{v(t)} dt.$$

We consider now the space $H^s(\mathcal{J}^n)$ ($s \in \mathbb{R}$) of functions $u \in \mathcal{D}'(\mathcal{J}^n)$ (the L. Schwartz space of distributions), such that $\langle D \rangle^s u \in L_2(\mathcal{J}^n)$ and the norm

$$(2.4) \quad \|u\|_s = \left(\sum_{\xi \in \mathbb{Z}^n} \langle \xi \rangle^{2s} |\tilde{u}(\xi)|^2 \right)^{1/2}$$

is finite, where

$$(2.5) \quad \langle \xi \rangle = \begin{cases} 1 & \text{if } \xi = 0, \\ |\xi| & \text{if } \xi \neq 0. \end{cases}$$

The norm of $u \in H^s(\mathcal{J}^n)$ is defined by (2.4).

Definition 1. Let $L_2(H^{q,s_0})$ ($q \geq 0, s_0 > 0$) be the space of all functions $u(x, t), x \in \mathcal{J}^n, t \geq 0$, satisfying the following conditions: for each $0 \leq \alpha \leq q$,

- i) $u(x, t) \in H^\alpha(\mathcal{J}^n) \forall t \in [0, +\infty)$.
- ii) The following series converges:

$$(2.6) \quad \sum_{\xi \in \mathbb{Z}^n} \langle \xi \rangle^{2\alpha} \int_0^\infty e^{-4\pi s_0 t} |\tilde{u}(\xi, t)|^2 dt.$$

The norm of the function $u \in L_2(H^{q,s_0})$ is defined by

$$(2.7) \quad \|u\|_{L_2(H^{q,s_0})} = \left(\sum_{\xi \in \mathbb{Z}^n} \langle \xi \rangle^{2q} \int_0^\infty e^{-4\pi s_0 t} |\tilde{u}(\xi, t)|^2 dt \right)^{1/2}.$$

The following lemmas are needed in the sequel.

Lemma 1. If $u \in L_2(H^{0,s_0})$, then

$$(2.8) \quad L(\tilde{u}(\xi, \cdot))(s) = \mathcal{F}(\check{u}(\cdot, s))(\xi).$$

Lemma 2. If $u \in L_2(H^{q,s_0}), q \geq 2m$ and $v \in L_2(H^{0,s_0})$, then

$$(2.9) \quad \int_{-\infty}^{+\infty} \|v(\cdot, s_0 + i\delta)\|^2 d\delta = \int_0^\infty e^{-4\pi s_0 t} \|v(\cdot, t)\|^2 dt,$$

$$(2.10) \quad \int_{-\infty}^{+\infty} (A\check{u}, \check{v})(s_0 + i\delta) d\delta = \int_0^\infty e^{-4\pi s_0 t} (Au, v) dt.$$

Proof. It is obvious that

$$\begin{aligned} \int_{-\infty}^{+\infty} \|\check{v}(\cdot, s_0 + i\delta)\|^2 d\delta &= \int_{-\infty}^{+\infty} \sum_{\xi \in \mathbb{Z}^n} |\check{v}(\xi, s_0 + i\delta)|^2 d\delta = \sum_{\xi \in \mathbb{Z}^n} \int_{-\infty}^{+\infty} |\check{v}(\xi, s_0 + i\delta)|^2 d\delta \\ &= \sum_{\xi \in \mathbb{Z}^n} \int_0^\infty e^{-4\pi s_0 t} |\check{v}(\xi, t)|^2 dt = \int_0^\infty e^{-4\pi s_0 t} \|\check{v}(\cdot, t)\|^2 dt, \end{aligned}$$

that is, we obtain (2.9).

Similarly we prove (2.10), taking into account that we can integrate an infinite sum in the integration of two sides of the equality

$$(A\check{u}, \check{v})(s_0 + i\delta) = \sum_{\xi \in \mathbb{Z}^n} \sigma(\xi) \check{u}(\xi, s_0 + i\delta) \overline{\check{v}(\xi, s_0 + i\delta)}.$$

□

Lemma 3. Under assumption (1.3) we have

$$(2.11) \quad (Au, u) \geq c\|u\|_m^2, \forall u \in H^{2m}(\mathcal{J}^n)$$

where c is independent of $u \in H^{2m}(\mathcal{J}^n)$.

Proof. From (1.3) and the fact that $\sigma(0) = 1$, it follows that there exists a number $c > 0$ independent of ξ such that $\sigma(\xi) \geq c\langle \xi \rangle^{2m}, \xi \in \mathbb{Z}^n$. The definition of A then gives (2.11). □

Next we introduce some notation and definitions on wavelets.

Definition 2. A multiresolution approximation (M.R.A.) of $L_2(\mathbb{R}^n)$ is, by definition, an increasing sequence $V_j, j \in \mathbb{Z}$, of closed linear subspaces of $L_2(\mathbb{R}^n)$ with the following properties:

$$\dots \subset V_{-1} \subset V_0 \subset V_1 \subset \dots \subset V_n \subset \dots;$$

$$\bigcap_{j \in \mathbb{Z}} V_j = \{0\}, \quad \overline{\bigcup_{j \in \mathbb{Z}} V_j} = L_2(\mathbb{R}^n);$$

for all $f \in L_2(\mathbb{R}^n)$ and all $j \in \mathbb{Z}$,

$$f(x) \in V_j \Leftrightarrow f(2x) \in V_{j+1};$$

for all $f \in L_2(\mathbb{R}^n)$ and $k \in \mathbb{Z}^n$,

$$f(x) \in V_0 \Leftrightarrow f(x - k) \in V_0.$$

There exists a function, which is called a scaling function (S.F.) $\phi(x) \in V_0$, such that the sequence $\{\phi(x - k), k \in \mathbb{Z}^n\}$ is a Riesz basis of V_0 .

An M.R.A. of $L_2(\mathbb{R}^n)$ is said to be r -regular ($r \in \mathbb{N}$) if the function ϕ is r -regular, that is, for each $m \in \mathbb{N}$ there exists c_m such that for all multi-indexes $\alpha, |\alpha| \leq r$, the following condition holds:

$$|D^\alpha \phi(x)| \leq c_m(1 + |x|)^{-m}.$$

Let us denote

$$\phi_{jk}(x) = 2^{nj/2} \phi(2^j x - k), k \in \mathbb{Z}^n.$$

Obviously

$$V_j = \overline{\text{span}}\{\phi_{jk}(x), k \in \mathbb{Z}^n\}.$$

The notation $[u](x)$ stands for the periodization operator of a function $u(x)$, that is, $[u](x) = \sum_{k \in \mathbb{Z}^n} u(x + k)$. Denote

$$\phi_j^k(x) := [\phi_{jk}](x) = 2^{\frac{nj}{2}} \sum_{l \in \mathbb{Z}^n} \phi(2^j(x + l) - k).$$

Similarly let us define an M.R.A. of $L_2(\mathcal{J}^n)$ as follows:

$$[V_j] := \overline{\text{span}}\{\phi_j^k(x), k \in \mathbb{Z}^{nj}\}, j \geq 0,$$

where $\mathbb{Z}^{nj} = \mathbb{Z}^n / 2^j \mathbb{Z}^n$. It is easy to check that

$$[V_0] \subset [V_1] \subset \dots \subset [V_n] \subset \dots, \quad \overline{\bigcup_{j \geq 0} [V_j]} = L_2(\mathcal{J}^n).$$

Furthermore, if

$$(\phi_{jk}, \phi_{jl}) = \delta_{kl}, k, l \in \mathbb{Z}^n,$$

then

$$(\phi_k^j, \phi_l^j) = \delta_{kl}, k, l \in \mathbb{Z}^{nj},$$

and $\dim[V_j] = 2^{nj}$.

For each $j \geq 0$, let $P_j : L_2(\mathcal{J}^n) \rightarrow [V_j]$ be the orthogonal projection of $L_2(\mathcal{J}^n)$ on $[V_j]$, which has the property

Theorem 1 ([14]). *Let $-r - 1 \leq s \leq r, -r \leq q \leq r + 1$ and $s \leq q$. Then*

$$(2.12) \quad \|u - P_j u\|_s \leq c 2^{j(s-q)} \|u\|_q$$

for all $u \in H^q(\mathcal{J}^n)$, where c is a constant independent of j and u .

By denoting $h = 2^{-j}$ and $V_h = [V_j]$, we can write (2.12) as follows:

$$(2.13) \quad \|u - P_j u\|_s \leq ch^{q-s} \|u\|_q.$$

3. CONVERGENCE ESTIMATES OF SOLUTIONS

Definition 3. A C^1 -mapping u in t , $u : [0, \infty) \rightarrow H^{2m}(\mathcal{J}^n)$ satisfying

$$(3.1) \quad \left(\frac{\partial u}{\partial t}, v\right) = -\mu(Au, v) - \int_0^t a(t - \tau)(Au(\tau), v)d\tau + (b, v),$$

$$(3.2) \quad (u(x, 0), v) = (u_0, v), \forall v \in L_2(\mathcal{J}^n)$$

is called a weak solution of problem (1.1)-(1.2).

Definition 4. A C^1 -mapping u_h in t , $u_h : [0, \infty) \rightarrow V_h$ satisfying

$$(3.3) \quad \left(\frac{\partial u_h}{\partial t}, v\right) = -\mu(Au_h, v) - \int_0^t a(t - \tau)(Au(\tau), v)d\tau + (b, v),$$

$$(3.4) \quad (u_h(x, 0), v) = (u_{0h}, v), \forall v \in V_h,$$

where $u_{0h} := \mathcal{R}u_0$ is a linear approximation of u_0 in V_h , is called a weak Galerkin-wavelet solution of problem (1.1)-(1.2).

The following theorem asserts the stability of the weak solution of problem (1.1)–(1.2).

Theorem 2. Let $u(x, t) \in L_2(H^{2m, s_0})$ be a weak solution of problem (1.1)-(1.2) with $b = 0$. Assume, moreover, that there exists a number $s_0 > 0$ such that

$$(3.5) \quad \mu + Re\ddot{a}(s_0 + i\delta) \geq 0, \forall \delta \in \mathbb{R}.$$

Then

$$\|u\|_{L_2(H^{0, s_0})}^2 \leq \frac{1}{4\pi s_0} \|u_0\|^2.$$

Proof. In (3.1), choosing $v = u$, multiplying two sides with $e^{-4\pi s_0 t}$ and integrating in t from 0 to $+\infty$ we obtain

$$(3.6) \quad \int_0^{+\infty} e^{-4\pi s_0 t} \left(\frac{\partial u}{\partial t}, u\right) dt = -\mu \int_0^{+\infty} e^{-4\pi s_0 t} (Au, u) dt - \int_0^{+\infty} e^{-4\pi s_0 t} \left(\int_0^t a(t - \tau) Au(\tau) d\tau, u\right) dt.$$

By means of $\left(\frac{\partial u}{\partial t}, u\right) = \frac{1}{2} \frac{d}{dt} \|u(\cdot, t)\|^2$ and using integration by parts, the left side of (3.6) gives

$$\int_0^{+\infty} e^{-4\pi s_0 t} \left(\frac{\partial u}{\partial t}, u\right) dt = -\frac{1}{2} \|u_0\|^2 + 2\pi s_0 \int_0^{+\infty} e^{-4\pi s_0 t} \|u(\cdot, t)\|^2 dt.$$

Using formulas (2.1), (2.10) and the fact that the left side is real, we have

$$\begin{aligned}
 & -\mu \int_0^\infty e^{-4\pi s_0 t} (Au, u) dt - \int_0^\infty e^{-4\pi s_0 t} \left(\int_0^t a(t-\tau) Au(\tau) d\tau, u \right) dt \\
 (3.7) \quad & = -\mu \int_{-\infty}^{+\infty} (A\check{u}, \check{u})(s_0 + i\delta) d\delta - \int_{-\infty}^{+\infty} \check{a}(s_0 + i\delta) (A\check{u}, \check{u})(s_0 + i\delta) d\delta \\
 & = - \int_{-\infty}^{+\infty} (\mu + \check{a}(s_0 + i\delta)) (A\check{u}, \check{u})(s_0 + i\delta) d\delta \\
 & = - \int_{-\infty}^{+\infty} (\mu + Re\check{a}(s_0 + i\delta)) (A\check{u}, \check{u})(s_0 + i\delta) d\delta.
 \end{aligned}$$

Therefore, if the condition (3.5) is satisfied, then the right side of (3.6) is nonpositive, which implies

$$2\pi s_0 \int_0^\infty e^{-4\pi s_0 t} \|u(\cdot, t)\|^2 dt \leq \frac{1}{2} \|u_0\|^2.$$

□

To estimate the Galerkin-wavelet solution, we need the following lemma.
 Let us consider the equation

$$(3.8) \quad Au(x) = f(x),$$

where A is the pseudodifferential operator introduced in Section 1.

Lemma 4. *Let \bar{u} be the weak solution of equation (3.8) and \bar{u}_h be the Galerkin-wavelet solution of this equation, that is, $(A\bar{u}_h, v) = (f, v), \forall v \in V_h$. Then if $\bar{u} \in H^q(\mathcal{J}^n)$ ($q \geq 2m$), then*

$$\|\bar{u} - \bar{u}_h\|_m \leq ch^{q-2m} \|\bar{u}\|_q,$$

where c is a constant independent of u and h .

Proof. The assumption gives $(A(\bar{u} - \bar{u}_h), v) = 0, \forall v \in V_h$. So it is easy to see that Lemma 3 yields

$$\begin{aligned}
 (3.9) \quad & c' \|\bar{u} - \bar{u}_h\|_m^2 \leq (A(\bar{u} - \bar{u}_h), \bar{u} - \bar{u}_h) = (A(\bar{u} - \bar{u}_h), \bar{u} - v) \\
 & = \sum_{\xi \in \mathbb{Z}^n} \sigma(\xi) \mathcal{F}(\bar{u} - \bar{u}_h)(\xi) \mathcal{F}(\bar{u} - v)(\xi) \\
 & \leq \sum_{\xi \in \mathbb{Z}^n} |\sigma(\xi)| |\mathcal{F}(\bar{u} - \bar{u}_h)(\xi)| |\mathcal{F}(\bar{u} - v)(\xi)| \\
 & \leq c'' \sum_{\xi \in \mathbb{Z}^n} \langle \xi \rangle^{2m} |\mathcal{F}(\bar{u} - \bar{u}_h)(\xi)| |\mathcal{F}(\bar{u} - v)(\xi)| \\
 & \leq c'' \left(\sum_{\xi \in \mathbb{Z}^n} \langle \xi \rangle^{2m} |\mathcal{F}(\bar{u} - \bar{u}_h)(\xi)|^2 \right)^{\frac{1}{2}} \left(\sum_{\xi \in \mathbb{Z}^n} \langle \xi \rangle^{2m} |\mathcal{F}(\bar{u} - v)(\xi)|^2 \right)^{\frac{1}{2}} \\
 & \leq c'' \|\bar{u} - \bar{u}_h\|_m \|\bar{u} - v\|_m,
 \end{aligned}$$

$\forall v \in V_h$, where c'' is a constant independent of u and h .

We obtain thus $\|\bar{u} - u_h\|_m \leq c\|\bar{u} - v\|_m, \forall v \in V_h$. Since v is arbitrary in V_h , we get $\|\bar{u} - u_h\|_m \leq c \inf_{v \in V_h} \|\bar{u} - v\|_m$. The desired estimate is followed immediately by Theorem 1. □

Corollary 1. *Let $w : [0, \infty) \rightarrow V_h$ be a C^1 -mapping satisfying*

$$(3.10) \quad \left(A \frac{\partial^j w}{\partial t^j}, v \right) = \left(A \frac{\partial^j u}{\partial t^j}, v \right), j = 0, 1$$

for all $v \in V_h$, with u , a weak solution of problem (1.1)-(1.2). If $\frac{\partial^j u}{\partial t^j} \in H^q(\mathcal{J}^n)$ ($j = 0, 1; q \geq 2m$) uniformly in $t \in [0, \infty)$, then

$$(3.11) \quad \left\| \frac{\partial^j (u - w)}{\partial t^j} \right\|_m \leq Ch^{q-2m} \left\| \frac{\partial^j u}{\partial t^j} \right\|_q, j = 0, 1,$$

where C is a constant independent of u, h .

Remark 1. Under the assumption of Section 1, the condition (3.10) always holds, because we have

$$\frac{d}{dt}(Aw, v) = \frac{d}{dt}(Au, v), v \in V_h.$$

Theorem 3. *Let $u(x, t) \in L_2(H^{q,s_0})$ be a solution of (3.1)-(3.2) and $u_h(x, t)$ a solution of (3.3)-(3.4). If (3.5) is satisfied and $\frac{\partial^j u}{\partial t^j} \in H^q(\mathcal{J}^n)$ ($j = 0, 1; q \geq 2m$) uniformly in $t \in [0, \infty)$, then*

$$(3.12) \quad \begin{aligned} \|u - u_h\|_{L_2(H^{0,s_0})}^2 \leq C \left\{ \|u_0 - u_{0,h}\|^2 + h^{2(q-2m)} [\|u_0\|_q^2 \right. \\ \left. + \int_0^\infty e^{-4\pi s_0 t} (\|u\|_q^2 + \left\| \frac{\partial u}{\partial t} \right\|_q^2) dt] \right\}. \end{aligned}$$

Proof. With w defined by (3.10), from (3.1), (3.3) it follows that for every $v \in V_h$ we obtain

$$\begin{aligned} \left(\frac{\partial(u-w)}{\partial t}, v \right) &= -\mu(Au, v) - \int_0^t a(t-\tau)(Au(\tau), v) d\tau + (b, v) - \left(\frac{\partial w}{\partial t}, v \right) \\ &= -\mu(Au, v) - \int_0^t a(t-\tau)(Au(\tau), v) d\tau + \mu(Au_h, v) \\ &\quad + \int_0^t a(t-\tau)(Au_h(\tau), v) d\tau + \left(\frac{\partial u_h}{\partial t}, v \right) - \left(\frac{\partial w}{\partial t}, v \right) \\ &= \mu(A(u_h - u), v) + \int_0^t a(t-\tau)(A(u_h - u)(\tau), v) d\tau + \left(\frac{\partial(u_h - w)}{\partial t}, v \right) \\ &= \mu(A(u_h - w), v) + \int_0^t a(t-\tau)(A(u_h - w)(\tau), v) d\tau + \left(\frac{\partial(u_h - w)}{\partial t}, v \right). \end{aligned}$$

Choosing $v = u_h - w$, multiplying two sides of the last equality with $e^{-4\pi s_0 t}$ and integrating in t from 0 to $+\infty$, we get

$$\begin{aligned} & \int_0^\infty e^{-4\pi s_0 t} \left(\frac{\partial(u-w)}{\partial t}, u_h - w \right) dt \\ &= \mu \int_0^\infty e^{-4\pi s_0 t} (A(u_h - w), u_h - w) dt + \int_0^\infty e^{-4\pi s_0 t} \left(\frac{\partial(u_h - w)}{\partial t}, u_h - w \right) dt \\ & \quad + \int_0^\infty e^{-4\pi s_0 t} \int_0^t a(t-\tau) (A(u_h - w)(\tau), u_h - w) d\tau dt \\ &= \int_{-\infty}^{+\infty} (\mu + \operatorname{Re} \check{a}(s_0 + i\delta)) (A(u_h - w)(s_0 + i\delta), (u_h - w)(s_0 + i\delta)) d\delta \\ & \quad + \int_0^\infty e^{-4\pi s_0 t} \left(\frac{\partial(u_h - w)}{\partial t}, u_h - w \right) dt. \end{aligned}$$

In view of (3.5) the first term in the last equality is nonnegative, and we thus have

$$(3.13) \quad \int_0^\infty e^{-4\pi s_0 t} \left(\frac{\partial(u_h - w)}{\partial t}, u_h - w \right) dt \leq \int_0^\infty e^{-4\pi s_0 t} \left(\frac{\partial(u-w)}{\partial t}, u_h - w \right) dt.$$

By integrating by parts, and using the equality $\left(\frac{\partial u}{\partial t}, u \right) = \frac{1}{2} \frac{d}{dt} \|u\|^2$, it is easy to see that the left side of (3.13) equals

$$(3.14) \quad -\frac{1}{2} \|u_{0h} - w_0\|^2 + 2\pi s_0 \int_0^\infty e^{-4\pi s_0 t} \|u_h - w\|^2 dt,$$

where $w_0 = w(x, 0)$. In view of the Cauchy inequality and the inequality $ab \leq \frac{1}{4\epsilon} a^2 + \epsilon b^2$, $a, b \geq 0$ for $\epsilon = \pi s_0$, the right side of (3.13) is estimated by

$$(3.15) \quad \frac{1}{4\pi s_0} \int_0^\infty e^{-4\pi s_0 t} \left\| \frac{\partial(u-w)}{\partial t} \right\|^2 dt + \pi s_0 \int_0^\infty e^{-4\pi s_0 t} \|u_h - w\|^2 dt.$$

From (3.13), (3.14), (3.15) it follows that

$$(3.16) \quad \int_0^\infty e^{-4\pi s_0 t} \|u_h - w\|^2 dt \leq \frac{1}{2\pi s_0} \|u_{0h} - w_0\|^2 + \frac{1}{4\pi^2 s_0^2} \int_0^\infty e^{-4\pi s_0 t} \left\| \frac{\partial(u-w)}{\partial t} \right\|^2 dt.$$

Corollary (1) yields

$$(3.17) \quad \|u_{0h} - w\|^2 \leq 2\|u_{0h} - u_0\|^2 + 2Ch^{2(q-2m)} \|u_0\|_q^2,$$

$$(3.18) \quad \int_0^\infty e^{-4\pi s_0 t} \left\| \frac{\partial(u-w)}{\partial t} \right\|^2 dt \leq Ch^{2(q-2m)} \int_0^\infty e^{-4\pi s_0 t} \left\| \frac{\partial u}{\partial t} \right\|_q^2 dt.$$

By using again Corollary 1 and the inequality $(a+b)^2 \leq 2a^2 + 2b^2$, we get

$$(3.19) \quad \|u - u_h\|_{L_2(H^{0,s_0})}^2 \leq Ch^{2(q-2m)} \|u\|_{L_2(H^{0,s_0})}^2 + 2\|u_h - w\|_{L_2(H^{0,s_0})}^2.$$

The desired estimate in the theorem now follows from (3.16), (3.17), (3.18) and (3.19). \square

ACKNOWLEDGEMENT

The authors would like to thank the Editor for helpful suggestions by which the paper is improved.
