ON THE DESTRUCTION OF ION-SOUND WAVES IN PLASMA
WITH STRONG SPACE-TIME DISPERSION

M. O. KORPUSOV

ABSTRACT. The object of study in this paper is a model equation that describes
ion-sound waves in plasma with the account of strong nonlinear dissipation and non-
linear sources of general type, together with strong space-time dispersion. Sufficient
destruction conditions are obtained for the solution of the corresponding ini-
tial boundary problem in a bounded three-dimensional domain with homogeneous
Dirichlet–Neumann conditions on the boundary. Moreover, the life-time of the solu-
tion is estimated. Finally, it is proved that, for every initial data in $H^2_0(\Omega)$, a strong
generalized solution of this problem exists locally in time, i.e., it is shown that the
solution destruction time is always positive.

§1. INTRODUCTION

We continue the study of nonlinear Sobolev equations with second derivative in time
and a nonlinear operator at the first order derivative in time. Consider the following
model equation:
\[
\frac{\partial^2}{\partial t^2} (-\Delta^2 u + \Delta u) + \frac{\partial}{\partial t} \text{div}(\phi_1(x, |\nabla u|)\nabla u) + \Delta u - \text{div}(\phi_2(x, |\nabla u|)\nabla u) = 0.
\]

H. A. Levine’s well-known method (see [13, 14, 3]) is not applicable to this equation, at
least in the form it was exposed in [14] and [3], because of the summand
\[
\frac{\partial}{\partial t} \text{div}(\phi_1(x, |\nabla u|)\nabla u).
\]

We observe that three methods are known that enable us to study how destruction
emerges. The first of them is the nonlinear capacity method by Pokhozhaev and Mitidieri
[8], the second is Levine’s energy method (see [13, 14, 3, 10]), and, finally the third is
the method of automodel regimes, based on various comparison tests and developed by
Samarski˘ı, Galaktionov, Kurdyumov, and Mikha˘ılov [9] (see also [2]).

§2. STATEMENT OF THE PROBLEM

When considering quasistationary processes in plasma, we encounter the following
dependence of the inductive capacity tensor on the wave vector $k \in \mathbb{R}^3$ and the frequency
$\omega \in \mathbb{R}^1$ (see, e.g., [4] and [7]):

\[
\varepsilon(k, \omega) = |k|^2 + 1 - \frac{\omega^2}{\omega^2_0}.
\]

This form of the inductive capacity tensor involves both the strong space dispersion of
the medium (this is reflected by the dependence on the wave vector $k$) and time dispersion
(this is reflected by the dependence on the frequency $\omega \in \mathbb{R}^1$). It should be noted that

Key words and phrases. Destruction, equations of Sobolev type, nonlinear analysis.

Supported by RFBR, grant no. 11-01-12018-ofi-m-2011, and by the President program for the support
(2.1) is the equation for a Fourier transform, and the inductive capacity operator itself looks like this:

\[
\hat{\varepsilon} = -\Delta \cdot + i \cdot + \omega_0^2 \int_0^t ds(t-s) \cdot ,
\]

where the electric displacement vector \(\mathbb{D}\) and the electric field strength \(\mathbb{E}\) are related by the formula

\[
\mathbb{D} = \hat{\varepsilon} \mathbb{E}.
\]

However, the inductive capacity operator \(\hat{\varepsilon}\) defined by \(\text{(2.2)}\) does not take the nonlinear properties of the medium into account. Therefore, our task is to generalize \(\text{(2.2)}\) to the nonlinear case. In fact, the general form of the equation relating the electric displacement vector in a medium and the electric field strength is

\[
\mathbb{D} = \mathbb{E} + 4\pi \mathbb{P},
\]

where \(\mathbb{P}\) is the polarization vector of the medium. With the time and space dispersion taken into account, \(\mathbb{P}\) depends on \(\mathbb{E}\) in the following way:

\[
\mathbb{P} = -\Delta \mathbb{E} + \omega_0^2 \int_0^t d\tau(t-\tau) \left[ \mathbb{E}(\tau) - \mathbb{E}_0 \mathbb{E}(\tau) \right].
\]

Here the function \(\mathbb{E}_0(x, |\mathbb{E}|)\) reflects (among other things) the Kerr dependence of the polarization vector on the field:

\[
\mathbb{E}_0(x, |\mathbb{E}|) = \mathbb{E}_0 |\mathbb{E}|^2, \quad \mathbb{E}_0 > 0.
\]

Next, this function appears in \(\text{(2.5)}\) with the “minus” sign, which corresponds to the so-called defocusing medium (see, e.g., \[6\]). In the quasistationary approximation, the Maxwell system of equations for the electric field takes the form

\[
\text{div } \mathbb{D} = -4\pi n, \quad \text{curl } \mathbb{E} = 0,
\]

where \(n\) is the concentration of free charges, which satisfies the equation

\[
\frac{\partial n}{\partial t} = \text{div } \mathbb{J}, \quad \mathbb{J} = \sigma(x, |\mathbb{E}|) \mathbb{E};
\]

physically, here \(\sigma(x, |\mathbb{E}|)\) is the conductivity of the medium (generally speaking, it may depend both on the point \(x \in \Omega\) and on the modulus \(|\mathbb{E}|\) of the electric field strength). Now, we make some assumptions about the properties of the domain \(\Omega \subset \mathbb{R}^3\) in which the system \(\text{(2.4)}-\text{(2.7)}\) of medium and field equations is considered. We assume that \(\Omega \subset \mathbb{R}^3\) is a bounded simply connected domain with a \(C^4,\delta\)-boundary \(\partial \Omega\) for some \(\delta \in (0, 1]\). Since \(\Omega\) is simply connected, the equation curl \(\mathbb{E} = 0\) implies the existence of an electric potential:

\[
\mathbb{E}(x) = -\nabla u(x), \quad x = (x_1, x_2, x_3) \in \Omega.
\]

But then equations \(\text{(2.4)}-\text{(2.6)}\) imply the formula

\[
-4\pi \Delta^2 u + \Delta u + 4\pi \omega_0^2 \int_0^t (t-\tau) \left[ \Delta u(\tau) + \text{div } (\mathbb{E}_0(x, |\mathbb{E}|) \nabla u)(\tau) \right] = 4\pi n,
\]

and equation \(\text{(2.7)}\) yields

\[
\frac{\partial n}{\partial t} = -\text{div } (\sigma(x, |\mathbb{E}|) \nabla u).
\]

The last two formulas imply yet another equation:

\[
\frac{\partial^2}{\partial t^2} (-4\pi \Delta^2 u + \Delta u) + 4\pi \frac{\partial}{\partial t} \text{div } (\sigma(x, |\mathbb{E}|) \nabla u) + 4\pi \omega_0^2 \Delta u - 4\pi \omega_0^2 \text{div } (\mathbb{E}_0(x, |\mathbb{E}|) \nabla u) = 0.
\]
In dimensionless variables, it takes the form

\[ (2.11) \quad \frac{\partial^2}{\partial t^2} (-\Delta^2 u + \Delta u) + \frac{\partial}{\partial t} \text{div}(\phi_1(x, |\nabla u|) \nabla u) + \Delta u - \text{div}(\phi_2(x, |\nabla u|) \nabla u) = 0, \]

where

\[ \Delta^2 \equiv \Delta, \quad \Delta = \left( \frac{\partial^2}{\partial x_1^2}, \frac{\partial^2}{\partial x_2^2}, \frac{\partial^2}{\partial x_3^2} \right), \]

\[ x = (x_1, x_2, x_3), \quad |\nabla u| = \sqrt{u_{x_1}^2 + u_{x_2}^2 + u_{x_3}^2}, \quad x \in \Omega \subset \mathbb{R}^3. \]

Physically, \( u = u(x, t) \) is an electric potential. Thus, if we assume that \( \partial \Omega \) is a “grounded ideal conductor”, we arrive at the Dirichlet–Neumann boundary conditions

\[ (2.12) \quad u \big|_{\partial \Omega} = \frac{\partial u}{\partial n_x} \big|_{\partial \Omega} = 0. \]

Furthermore, we supplement equation (2.11) with the initial conditions

\[ (2.13) \quad u(x, 0) = u_0(x), \quad u'(x, 0) = u_1(x), \quad u_0(x), u_1(x) \in H^2_0(\Omega); \]

here and below, \( \cdot' \) denotes the partial derivative with respect to time.

### §3. DESTRUCTION OF A STRONG GENERALIZED SOLUTION

First, we introduce some conditions on the functions

\[ \phi_1(x, s), \phi_2(x, s) : \Omega \otimes \mathbb{R}^1_+ \to \mathbb{R}^1. \]

We recall the definition of a Carathéodory function.

**Definition 1.** A mapping \( f(x, s) : \Omega \otimes \mathbb{R}^1_+ \to \mathbb{R}^1 \) is called a Carathéodory function if it is continuous in \( s \) for a.e. \( x \in \Omega \) and measurable in \( x \in \Omega \) for all \( s \in \mathbb{R}^1_+ \).

We impose the following conditions on the function \( \phi_1(x, s) : \Omega \otimes \mathbb{R}^1_+ \to \mathbb{R}^1 \).

**Conditions on \( \phi_1(x, s) \).**

1. \( \phi_1(x, s) \) is a Carathéodory function;
2. for a.e. \( x \in \Omega \), the function \( \phi_1(x, s) \) satisfies the following growth conditions:

\[ |\phi_1(x, s)| \leq c_1 + c_2|s|^{p_1-2} \quad \text{for} \quad p_1 \in (2, 4); \]

for a.e. \( x \in \Omega \), \( \phi_1(x, s) \) belongs to \( C^1([0, +\infty)) \) as a function of \( s \), and

\[ |s \phi_1'(x, s)| \leq c_1 + c_2|s|^{p_1-2} \quad \text{for} \quad p_1 \in (2, 4), \]

\[ \phi(x, s) \geq 0, \quad \phi_1'(x, s) \geq 0 \quad \text{for all} \quad s \in \mathbb{R}^1_+ \quad \text{and a.e.} \quad x \in \Omega; \]

3. for every \( v \in \mathbb{W}_{0, p_1}^1(\Omega) \), the operator \( \text{div}(\phi_1(x, |\nabla v|) \nabla v) \) is locally Lipschitz continuous and Fréchet differentiable:

\[ \|\text{div}(\phi_1(x, |\nabla v_1|) \nabla v_1) - \text{div}(\phi_1(x, |\nabla v_2|) \nabla v_2)\|_{-1, p_1'} \leq \mu_1(R_1) \|\nabla v_1 - \nabla v_2\|_{p_1'} \]

for all \( v_1, v_2 \in \mathbb{W}_{0, p_1}^1(\Omega) \), where \( p_1' = p_1/(p_1 - 1) \), \( \|\cdot\|_{-1, p_1'} \) is the norm of the Banach space \( \mathbb{W}_{-1, p_1}^1(\Omega) \), \( \|\cdot\|_{p_1} \) is the norm of the Banach space \( \mathbb{L}^{p_1}(\Omega) \),

\[ R_1 = \max\{\|\nabla v_1\|_{p_1}, \|\nabla v_2\|_{p_1}\}, \]

and \( \mu_1(\cdot) \) is a nonnegative and monotone nondecreasing function.
Remark 1. The fact that the same constants $c_1, c_2 > 0$ occur both in (3.7) and (3.8) is not a strong restriction. We have taken them to be the same only to shorten unnecessarily bulky formulas. Note that, for instance, the function $\phi_1(x, s) = s^{p_1 - 2}$ satisfies the above conditions if $p_1 \in [3, 4]$. For this function, the operator

$$
\text{div}(|\nabla u|^{p_1 - 2} \nabla u) \quad \text{for} \quad p_1 \in [3, 4]
$$

is the classical pseudo-Laplacian.

Now, we introduce some assumptions about $\phi_2(x, s) : \Omega \otimes \mathbb{R}^1_+ \to \mathbb{R}^1$.

Conditions on $\phi_2(x, s)$.

(i) $\phi_2(x, s)$ is a Carathéodory function;
(ii) it satisfies the growth condition

$$
|\phi_2(x, s)| \leq c_3 + c_4|s|^{p_2 - 2} \quad \text{for a.e.} \quad x \in \Omega \quad \text{and} \quad p_2 \in (2, 6);
$$

(iii) there is $\vartheta > 2$ such that for all $v(x) \in W^{1,p_2}_0(\Omega)$ we have

$$
\int_\Omega |\nabla v|^2 \phi_2(x, |\nabla v|) \, dx \geq \vartheta \int_\Omega dx \int_0^{|\nabla v|} s \phi_2(x, s) \, ds;
$$

(iv) for all $v \in W^{1,p_1}_0(\Omega)$, the operator $\text{div}(\phi_2(x, |\nabla v|)\nabla v)$ is locally Lipschitz-continuous:

$$
\|\text{div}(\phi_2(x, |\nabla v_1|)\nabla v_1) - \text{div}(\phi_2(x, |\nabla v_2|)\nabla v_2)\|_{-1,p_2'} \leq \mu_2(R_2) \|\nabla v_1 - \nabla v_2\|_{p_2}
$$

for all $v_1, v_2 \in W^{1,p_2}_0(\Omega)$, where $p_2' = p_2/(p_2 - 1)$, $\| \cdot \|_{-1,p_2'}$ is the norm in the Banach space $W^{-1,p_2}_0(\Omega)$, $\| \cdot \|_{p_2}$ is the norm in the Banach space $L^{p_2}(\Omega)$,

$$
R_2 = \max\{\|\nabla v_1\|_{p_2}, \|\nabla v_2\|_{p_2}\},
$$

and $\mu_2(\cdot)$ is a nonnegative monotone nondecreasing function.

The constants $c_1, c_2, c_3, c_4$ are positive.

Before giving the definition of a strong generalized solution of the problem, we need to discuss the properties of the operators

$$
\text{div}(\phi_1(x, |\nabla v|)\nabla v) \quad \text{and} \quad \text{div}(\phi_2(x, |\nabla v|)\nabla v).
$$

For this, we recall the notion of a Nemytski operator.

Definition 2. For a Carathéodory function $f(x, u)$, the operator $N_f(u) \equiv f(x, u)$ is called a Nemytski operator.

We prove that, under the conditions (i)$_1$–(ii)$_1$ and (i)$_2$–(ii)$_2$ these operators act, respectively, as follows:

$$
\text{div}(\phi_1(x, |\nabla v|)\nabla v) : W^{1,p_1}_0(\Omega) \to W^{-1,p_1'}(\Omega),
$$

$$
\text{div}(\phi_2(x, |\nabla v|)\nabla v) : W^{1,p_2}_0(\Omega) \to W^{-1,p_2'}(\Omega),
$$

where $p_1' = p_1/(p_1 - 1)$ and $p_2' = p_2/(p_2 - 1)$. Indeed, consider the first of them (the second is treated similarly). Let $v \in W^{1,p_1}_0(\Omega)$ with $p_1 \in (2, 4]$. Then

$$
\eta = \nabla v : W^{1,p_1}_0(\Omega) \to L^{p_1}(\Omega) \otimes L^{p_1}(\Omega) \otimes L^{p_1}(\Omega).
$$

Consider the vector-valued function

$$
f(x, \eta) \equiv \phi_1(x, |\eta|)\eta.
$$

By (i)$_1$, $\phi_1(x, s) : \Omega \otimes \mathbb{R}^1_+ \to \mathbb{R}^1$ is a Carathéodory function. Then $\phi_1(x, |\eta|)$, when viewed as a mapping

$$
\phi_1(x, |\eta|) : \Omega \otimes \mathbb{R}^3 \to \mathbb{R}^1,
$$

License or copyright restrictions may apply to redistribution; see https://www.ams.org/journal-terms-of-use
is also a Carathéodory function. Thus, the product \( \phi_1(x, |\eta|)\eta \) is also a Carathéodory function of \( \eta = (\eta_1, \eta_2, \eta_3) \). So, we have proved that
\[
 f(x, \eta) \equiv \phi_1(x, |\eta|)\eta : \Omega \otimes \mathbb{R}^3 \rightarrow \mathbb{R}^3
\]
is a Carathéodory function. Now, we obtain a growth estimate for \( f(x, \eta) \):
\[
 |f(x, \eta)| \leq |\phi_1(x, |\eta|)| |\eta| \leq c_1|\eta| + c_2|\eta|^{p_1-1}
\]
(3.10)
\[
\leq \frac{|\eta|}{p_1-1} + \frac{p_1-2}{p_1-1} c_1^{(p_1-1)/(p_1-2)} + c_2|\eta|^{p_1-1} = \bar{c}_1 + \bar{c}_2|\eta|^{p_1-1},
\]
where
\[
 \bar{c}_1 = \frac{p_1-2}{p_1-1} c_1^{(p_1-1)/(p_1-2)}, \quad \bar{c}_2 = c_2 + \frac{1}{p_1-1}.
\]
So, \( f(x, \eta) \) is a Carathéodory function and satisfies the growth condition (3.10). This means that the corresponding Nemytskii operator acts in the following way:
\[
(3.11) \quad \xi = N_f(\eta) : \mathbb{L}^{p_1}(\Omega) \otimes \mathbb{L}^{p_1}(\Omega) \otimes \mathbb{L}^{p_1}(\Omega) \rightarrow \mathbb{L}^{p'_1}(\Omega) \otimes \mathbb{L}^{p'_1}(\Omega) \otimes \mathbb{L}^{p'_1}(\Omega), \quad p'_1 = \frac{p_1}{p_2-1},
\]
and, by Krasnosel’skiǐ’s theorem [4], it is a continuous mapping in the strong topologies of the corresponding Banach spaces
\[
\mathcal{B} \equiv \mathbb{L}^{p_1}(\Omega) \otimes \mathbb{L}^{p_1}(\Omega) \otimes \mathbb{L}^{p_1}(\Omega) \quad \text{and} \quad \mathcal{B}^* \equiv \mathbb{L}^{p'_1}(\Omega) \otimes \mathbb{L}^{p'_1}(\Omega) \otimes \mathbb{L}^{p'_1}(\Omega).
\]
It remains to observe that the operator \( \text{div} \cdotp \), understood in the weak sense, acts as shown below:
\[
(3.12) \quad \text{div} \xi : \mathbb{L}^{p'_1}(\Omega) \otimes \mathbb{L}^{p'_1}(\Omega) \otimes \mathbb{L}^{p'_1}(\Omega) \rightarrow \mathbb{W}^{-1,p'_1}(\Omega).
\]
Since
\[
\text{div}(\phi_1(x, |\nabla v|)\nabla v) = \text{div}(N_f(\nabla v)),
\]
we see that
\[
\text{div}(\phi_1(x, |\nabla v|)\nabla v) : \mathbb{W}^{0,p_1}(\Omega) \rightarrow \mathbb{W}^{-1,p'_1}(\Omega).
\]
Now, by (ii)_1 and (ii)_2, we have \( p_1 \in (2, 4) \) and \( p_2 \in (2, 6) \). Since the domain \( \Omega \subset \mathbb{R}^3 \) is bounded and the space \( \mathbb{H}^2(\Omega) \) is reflexive, we arrive at the following two chains of dense and continuous embeddings:
\[
(3.13) \quad \mathbb{H}^2(\Omega) \subset \mathbb{W}^{0,p_1}(\Omega) \subset \mathbb{W}^{-1,p'_1}(\Omega) \subset \mathbb{H}^2(\Omega),
\]
\[
(3.14) \quad \mathbb{H}^2(\Omega) \subset \mathbb{W}^{0,p_2}(\Omega) \subset \mathbb{W}^{-1,p'_2}(\Omega) \subset \mathbb{H}^2(\Omega).
\]
We denote by \( \langle \cdot, \cdot \rangle \) the pairing between \( \mathbb{H}^2(\Omega) \) and \( \mathbb{H}^{-2}(\Omega) \), by \( \langle \cdot, \cdot \rangle_1 \) the pairing between \( \mathbb{W}^{0,p_1}(\Omega) \) and \( \mathbb{W}^{-1,p'_1}(\Omega) \) and, finally, by \( \langle \cdot, \cdot \rangle_2 \) the pairing between \( \mathbb{W}^{0,p_2}(\Omega) \) and \( \mathbb{W}^{-1,p'_2}(\Omega) \). Next, we consider the following embedding operators \( \mathcal{J}_1 \) and \( \mathcal{J}_2 \):
\[
\mathcal{J}_1 : \mathbb{H}^2(\Omega) \rightarrow \mathbb{W}^{0,p_1}(\Omega), \quad \mathcal{J}_2 : \mathbb{H}^2(\Omega) \rightarrow \mathbb{W}^{0,p_2}(\Omega).
\]
By \( \mathbb{H}^2(\Omega) \) and \( \mathbb{H}^2(\Omega) \), the corresponding transpose operators
\[
\mathcal{J}^*_1 : \mathbb{W}^{-1,p'_1}(\Omega) \rightarrow \mathbb{H}^{-2}(\Omega), \quad \mathcal{J}^*_2 : \mathbb{W}^{-1,p'_2}(\Omega) \rightarrow \mathbb{H}^{-2}(\Omega)
\]
defined by
\[
(3.15) \quad \langle \mathcal{J}^*_1 f_1, w \rangle = \langle f_1, \mathcal{J}_1 w \rangle_1 \quad \text{for all} \quad f_1 \in \mathbb{W}^{-1,p'_1}(\Omega) \text{ and all} \quad w \in \mathbb{H}^2(\Omega),
\]
\[
(3.16) \quad \langle \mathcal{J}^*_2 f_2, w \rangle = \langle f_2, \mathcal{J}_2 w \rangle_2 \quad \text{for all} \quad f_2 \in \mathbb{W}^{-1,p'_2}(\Omega) \text{ and all} \quad w \in \mathbb{H}^2(\Omega),
\]
are also embeddings. So, if we identify \( \mathbb{H}^2(\Omega) \) with \( \mathcal{J}_1 \mathbb{H}^2(\Omega) \subset \mathbb{W}^{0,p_1}(\Omega) \) and \( \mathbb{H}^2(\Omega) \) with \( \mathcal{J}_2 \mathbb{H}^2(\Omega) \subset \mathbb{W}^{0,p_2}(\Omega) \), we also may identify \( \mathbb{W}^{-1,p'_1}(\Omega) \) with \( \mathcal{J}^*_1 \mathbb{W}^{-1,p'_1}(\Omega) \subset \mathbb{H}^{-2}(\Omega) \), and
\[ \mathbb{W}^{-\frac{1}{2}}(\Omega) \] with \( \mathbb{H}^{-\frac{1}{2}}(\Omega) \). After these identifications, (3.15) and (3.16) turn into

(3.17) \[ \langle f_1, w \rangle = \langle f_1, w \rangle_1 \quad \text{for all} \quad f_1 \in \mathbb{W}^{-\frac{1}{2}}_0(\Omega) \quad \text{and} \quad w \in \mathbb{H}^2(\Omega), \]

(3.18) \[ \langle f_2, w \rangle = \langle f_2, w \rangle_2 \quad \text{for all} \quad f_2 \in \mathbb{W}^{-\frac{1}{2}}_0(\Omega) \quad \text{and} \quad w \in \mathbb{H}^2(\Omega). \]

Now, we are in a position to define a strong generalized solution of problem (2.11)–(2.13).

**Definition 3.** A function \( u(x,t) \in \mathbb{C}^2([0,T];\mathbb{H}^2_0(\Omega)) \) of class \( \mathbb{C}^2([0,T];\mathbb{H}^2_0(\Omega)) \) for some \( T > 0 \) is called a strong generalized solution of problem (2.11)–(2.13) if

(3.19) \[ \langle D(u), w \rangle = 0 \quad \text{for all} \quad t \in [0,T] \quad \text{and} \quad w \in \mathbb{H}^2_0(\Omega), \]

where

\[ D(u) \equiv \frac{\partial^2}{\partial t^2} (-\triangle^2 u + \triangle u) + \frac{\partial}{\partial t} \text{div}(\phi_1(x,|\nabla u|)\nabla u) + \triangle u - \text{div}(\phi_2(x,|\nabla u|)\nabla u), \]

and \( \langle \cdot, \cdot \rangle \) denotes the pairing between the Banach spaces \( \mathbb{H}^2_0(\Omega) \) and \( \mathbb{H}^{-2}(\Omega) \).

**Remark 2.** It should be noted that the operator \( \triangle^2 \) is understood in the following sense:

\[ \langle \triangle^2 u, w \rangle \equiv \int_{\Omega} \triangle u \triangle w \, dx \quad \text{for all} \quad u, w \in \mathbb{H}^2_0(\Omega). \]

When we calculate the distribution \( \triangle^2 u \) in accordance with the above identity, we shall refer to “integration by parts”.

We introduce the following notation:

(3.20) \[ \Phi(t) \equiv \Phi[u](t) \equiv \frac{1}{2} \int_{\Omega} |\triangle u|^2 \, dx + \frac{1}{2} \int_{\Omega} |\nabla u|^2 \, dx, \]

(3.21) \[ J(t) \equiv J[u](t) \equiv \int_{\Omega} |\triangle u'|^2 \, dx + \int_{\Omega} |\nabla u'|^2 \, dx. \]

**Lemma 1.** If \( u(x,t) \in \mathbb{C}^1([0,T];\mathbb{H}^1_0(\Omega)) \) for some \( T > 0 \), then

(3.22) \[ (\Phi')^2(t) \leq 2\Phi(t)J(t) \quad \text{for all} \quad t \in [0,T]. \]

**Proof.** Since \( u(x,t) \in \mathbb{C}^1([0,T];\mathbb{H}^1_0(\Omega)) \), we have

\[ \Phi' = \int_{\Omega} (\nabla u', \nabla u) \, dx + \int_{\Omega} \triangle u' \triangle u \, dx. \]

Next,

\[ \left| \int_{\Omega} (\nabla u', \nabla u) \, dx \right| \leq \| \nabla u' \|_2 \| \nabla u \|_2, \]

\[ \left| \int_{\Omega} \triangle u' \triangle u \, dx \right| \leq \left( \int_{\Omega} |\triangle u'|^2 \, dx \right)^{1/2} \left( \int_{\Omega} |\triangle u|^2 \, dx \right)^{1/2}. \]
Therefore,

\[
(\Phi')^2 \leq \left( \left\| \nabla u' \right\|_2 \right\| \nabla u \right\|_2 + \left( \int_{\Omega} \left| \Delta u' \right|^2 dx \right)^{1/2} \left( \int_{\Omega} \left| \Delta u \right|^2 dx \right)^{1/2} \right)^2
\]

\[
\leq \left( \left\| \nabla u' \right\|_2 \right\| \nabla u \right\|_2 + \int_{\Omega} \left| \Delta u' \right|^2 dx \int_{\Omega} \left| \Delta u \right|^2 dx
\]

\[
+ 2\left\| \nabla u' \right\|_2 \left\| \nabla u \right\|_2 \left( \int_{\Omega} \left| \Delta u' \right|^2 dx \right)^{1/2} \left( \int_{\Omega} \left| \Delta u \right|^2 dx \right)^{1/2}
\]

\[
\leq \left( \left\| \nabla u' \right\|_2 \right\| \nabla u \right\|_2 + \int_{\Omega} \left| \Delta u' \right|^2 dx \int_{\Omega} \left| \Delta u \right|^2 dx
\]

\[
+ \left\| \nabla u' \right\|_2 \int_{\Omega} \left| \Delta u \right|^2 dx + \left\| \nabla u \right\|_2 \int_{\Omega} \left| \Delta u' \right|^2 dx
\]

\[
= \left( \left\| \nabla u' \right\|_2 + \int_{\Omega} \left| \Delta u' \right|^2 dx \right) \left( \left\| \nabla u \right\|_2 + \int_{\Omega} \left| \Delta u \right|^2 dx \right) = 2J(t)\Phi(t),
\]

where we have used the inequality \(2ab \leq a^2 + b^2\) with

\[
a = \left\| \nabla u' \right\|_2 \left( \int_{\Omega} \left| \Delta u' \right|^2 dx \right)^{1/2}, \quad b = \left\| \nabla u \right\|_2 \left( \int_{\Omega} \left| \Delta u \right|^2 dx \right)^{1/2}.
\]

We pass to the deduction of the first and the second energy inequalities. Suppose that for some \(T > 0\) problem (2.11)–(2.13) admits a strong generalized solution \(u(x, t)\) of class \(C^2([0, T]; \mathcal{H}_0^2(\Omega))\), in the sense of Definition 3.

We take the solution \(u\) itself for the role of \(w\) in (3.19): \(w = u\). After “integration by parts”, we obtain

\[
\int_\Omega \Delta u' \Delta u \, dx + \int_\Omega (\nabla u', \nabla u) \, dx
\]

\[
+ \int_\Omega \left( \nabla u, \frac{\partial}{\partial t} [\phi_1(x, |\nabla u|) \nabla u] \right) \, dx + \int_\Omega |\nabla u|^2 \, dx = \int_\Omega \phi_2(x, |\nabla u|) |\nabla u|^2 \, dx.
\]

Observe that

\[
\int_\Omega (\nabla u', \nabla u) \, dx = \frac{d}{dt} \int_\Omega (\nabla u', \nabla u) \, dx - ||\nabla u'||^2_2
\]

\[
= \frac{1}{2} \frac{d^2}{dt^2} ||\nabla u||^2_2 - ||\nabla u'||^2_2,
\]

\[
\int_\Omega \Delta u' \Delta u \, dx = \frac{d}{dt} \int_\Omega \Delta u' \Delta u \, dx - \int_\Omega |\Delta u'|^2 \, dx
\]

\[
= \frac{1}{2} \frac{d^2}{dt^2} \int_\Omega |\Delta u|^2 \, dx - \int_\Omega |\Delta u'|^2 \, dx.
\]

Consider the following integral separately:

\[
I_1 \equiv \int_\Omega \left( \nabla u, \frac{\partial}{\partial t} [\phi_1(x, |\nabla u|) \nabla u] \right) \, dx
\]

\[
= \int_\Omega \phi_1(x, |\nabla u|) (\nabla u', \nabla u) \, dx + \int_\Omega |\nabla u|^2 \phi'_{1s} (x, s) \left|_{s=|\nabla u|} \frac{\partial}{\partial t} |\nabla u| \right) \, dx
\]

\[
= I_2 + I_3.
\]
We transform the integral $I_3$:

$$I_3 = \int_\Omega |\nabla u|^2 \phi_1'(x,s) \frac{\partial}{\partial t} |\nabla u| \, dx = \int_\Omega |\nabla u| \phi_1'(x,s) \frac{1}{2} \frac{\partial}{\partial t} |\nabla u|^2 \, dx$$

(3.27)

$$= \frac{1}{2} \int_\Omega |\nabla u| \phi_1'(x,s) (\nabla u', \nabla u) \, dx$$

$$= \frac{1}{2} \int_\Omega (\nabla u', |\nabla u| \phi_1'(x,s) |\nabla u|) \, dx.$$ 

For $I_2$, we have

$$I_2 = \int_\Omega (\nabla u', \phi_1(x, |\nabla u|) \nabla u) \, dx.$$ 

(3.28)

Now, using the notation (3.20), (3.21), from (3.23) and the definitions of $I_2$ and $I_3$ we deduce the formula

$$\Phi'' - J + I_2 + I_3 + \int_\Omega |\nabla u|^2 \, dx = \int_\Omega \phi_2(x, |\nabla u|)|\nabla u|^2 \, dx.$$ 

(3.29)

Our next goal is to obtain upper estimates for $I_2$ and $I_3$ by using (3.28) and (3.27). We treat $I_2$ first and exploit the growth condition (3.1). This yields the following chain of inequalities:

$$|I_2| \leq \int_\Omega |\nabla u'| |\phi_1(x, |\nabla u|)| |\nabla u| \, dx \leq \|\nabla u'\|_2 \left(\int_\Omega |\phi_1(x, |\nabla u|)|^2 |\nabla u|^2 \, dx\right)^{1/2}$$

$$\leq \frac{\varepsilon}{2} \|\nabla u'\|_2 + \frac{1}{2\varepsilon} \int_\Omega |\phi_1(x, |\nabla u|)|^2 |\nabla u|^2 \, dx$$

(3.30)

$$\leq \frac{\varepsilon}{2} J + \frac{2c_1^2}{\varepsilon} \int_\Omega |\nabla u|^2 \, dx + \frac{2c_1^2}{\varepsilon} \int_\Omega |\nabla u|^{2(1+q)} \, dx$$

$$\leq \frac{\varepsilon}{2} J + \frac{2c_1^2}{\varepsilon} \Phi + \frac{c_2}{\varepsilon} \int_\Omega |\nabla u|^{2(1+q)} \, dx,$$

where we have denoted $q_1 = p_1 - 2$, and $\varepsilon > 0$ is strictly positive. Now, we consider the integral

$$I_4 = \int_\Omega |\nabla u|^{2(1+q_1)} \, dx.$$ 

(3.31)

Since $p_1 \in (2, 4)$ by (ii)$_1$, it follows that $q_1 = p_1 - 2 \in (0, 2]$. Therefore, we have the following continuous embedding:

$$H_0^2(\Omega) \subset W_0^{1,q}(\Omega) \quad \text{for} \quad q = 2(1 + q_1).$$

Denote by $c_5 > 0$ the best possible constant in the inequality

$$\|\nabla w\|_q \leq c_5 \|\nabla w\|_2 \quad \text{for all} \quad w \in H_0^2(\Omega).$$

We have

$$I_4 = \int_\Omega |\nabla u|^{2(1+q_1)} \, dx \leq c_5^q \left(\int_\Omega |\nabla u|^2 \, dx\right)^{q/2}$$

(3.32)

$$= c_5^q 2^{q/2} \left(\frac{1}{2} \int_\Omega |\nabla u|^2 \, dx\right)^{q/2} \leq c_5^q 2^{q/2} \Phi^{1+q_1}, \quad q_1 = p_1 - 2.$$
Together with (3.30), this yields the following estimate for $I_2$:

\begin{equation}
|I_2| \leq \frac{\varepsilon}{2} J + \frac{2c_1^2}{\varepsilon} \Phi + \frac{c_2^2 c_3^2 q^2/2}{\varepsilon} \Phi^{1+q_1}, \quad q_1 = p_1 - 2, \quad \varepsilon > 0.
\end{equation}

Now, we estimate $I_3$ by using (3.27). We have

\begin{equation}
|I_3| \leq \int_{\Omega} |\nabla u|^2 \phi_1'(s, |\nabla u|) |\nabla u|^2 \, dx \leq \|\nabla u\|_2 \left( \int_{\Omega} |\phi_1'(s, |\nabla u|)|^2 |\nabla u|^4 \, dx \right)^{1/2}
\end{equation}

\begin{equation}
\leq \frac{\varepsilon}{2} \|\nabla u\|_2^2 + \frac{1}{2\varepsilon} \int_{\Omega} |\phi_1'(s, |\nabla u|)|^2 |\nabla u|^2 |\nabla u|^2 \, dx.
\end{equation}

Observe that the functions $\phi_1'(x, s)$ and $\phi_1(x, s)$ obey similar growth conditions with the same constants (see (ii)1). So, we can deduce the same estimate for $I_3$ as has been obtained for $I_2$, namely,

\begin{equation}
|I_3| \leq \frac{\varepsilon}{2} J + \frac{2c_1^2}{\varepsilon} \Phi + \frac{c_2^2 c_3^2 q^2/2}{\varepsilon} \Phi^{1+q_1}, \quad q_1 = p_1 - 2, \quad \varepsilon > 0.
\end{equation}

Finally, (3.33), (3.35), and (3.29) imply

\begin{equation}
\Phi'' - J + \varepsilon J + \frac{4c_1^2}{\varepsilon} \Phi + \frac{c_2^2 c_3^2 q^2/2+1}{\varepsilon} \Phi^{1+q_1} + \int_{\Omega} |\nabla u|^2 \, dx \geq \int_{\Omega} \phi_2(x, |\nabla u|) |\nabla u|^2 \, dx,
\end{equation}

where $q = 2(1 + q_1)$ and $q_1 = p_1 - 2$.

We pass to the second energy inequality. For this, consider the functional

\begin{equation}
\psi(v) \equiv \int_{\Omega} \, dx \mathcal{F}(x, |\nabla v|), \quad \mathcal{F}(x, |\nabla v|) = \int_0^{\nabla v} s \phi_2(x, s) \, ds \quad \text{for all} \quad v \in W^{1,p_2}(\Omega).
\end{equation}

It can be rewritten in the form

\begin{equation}
\psi(h) = \int_{\Omega} \, dx \mathcal{F}(x, h), \quad \text{where} \quad h = |\nabla v| \in L^{p_2}(\Omega).
\end{equation}

The following lemma is well known.

**Lemma 2.** Suppose $\phi_2(x, s)$ satisfies (i)2–(ii)2. Then the functional $\psi(h)$ defined by (3.38) and acting as follows:

\[ \psi(h) : L^{q_2+2}(\Omega) \to \mathbb{R}, \quad q_2 = p_2 - 2, \]

is Fréchet differentiable, with Fréchet derivative given by

\[ \psi'(h) : L^{q_2+2}(\Omega) \to L^{(q_2+2)/(q_2+1)}(\Omega), \]

\[ \psi'(h) = N_{\phi_2(x,s)}(h) \quad \text{for all} \quad h(x) \in L^{q_2+2}(\Omega) \quad \text{and a.e.} \quad x \in \Omega. \]

We also need the following result (see, e.g., [12]).

**Theorem 1.** Consider two operators $\mathcal{F} : B_1 \to B_2$ and $\mathcal{G} : B_2 \to B_3$ and suppose that $\mathcal{F}$ is Fréchet differentiable at a point $u \in B_1$ and $\mathcal{G}$ is Fréchet differentiable at $\mathcal{F}(u)$. Then the composition

\[ K \equiv \mathcal{G} \circ \mathcal{F} \]

is Fréchet differentiable at $u \in B_1$ and

\begin{equation}
K'(u) = \mathcal{G}'(\mathcal{F}(u)) \mathcal{F}'(u).
\end{equation}

By Lemma 2, it follows that for the functional $\psi(u)$ defined by (3.37) we have

\begin{equation}
\frac{d}{dt} \psi(u) = \int_{\Omega} |\nabla u| \phi_2(x, |\nabla u|) \frac{\partial}{\partial t} |\nabla u| \, dx
\end{equation}

whenever $u(x, t) \in C^{(1)}([0, T]; L^2(\Omega))$. 

We do elementary transformations in (3.40):

\[
\int_\Omega |\nabla u|\phi_2(x,|\nabla u|)\frac{\partial}{\partial t}|\nabla u|\,dx = \frac{1}{2} \int_\Omega \phi_2(x,|\nabla u|)\frac{\partial}{\partial t}|\nabla u|^2\,dx \\
\tag{3.41}
\]

\[
= \int_\Omega \phi_2(x,|\nabla u|)(\nabla u',\nabla u)\,dx = \int_\Omega (\nabla u',\phi_2(x,|\nabla u|)\nabla u)\,dx \\
= -\langle \text{div}(\phi_2(x,|\nabla u|)\nabla u),u' \rangle = -\langle \text{div}(\phi_2(x,|\nabla u|)\nabla u),u' \rangle; \\
\]

we recall that \(\langle \cdot , \cdot \rangle_2\) stands here for the pairing between \(\mathbb{W}_0^{1,2}(\Omega)\) and \(\mathbb{W}^{-1,\frac{3}{2}}(\Omega)\). The last identity is true by (3.18).

Now, we pass directly to the second energy inequality. For the role of \(I_5\) in (3.19), we take the time derivative of the solution: \(w = u'\). After “integration by parts”, taking into account (3.41) and the definition (3.21) of \(J\), we arrive at

\[
\frac{1}{2}\frac{d}{dt}J + \int_\Omega \left(\nabla u',\frac{\partial}{\partial t}[\phi_1(x,|\nabla u|)\nabla u]\right)\,dx + \frac{1}{2}\frac{d}{dt}\int_\Omega |\nabla u|^2\,dx \\
\tag{3.42}
= -\langle \text{div}(\phi_2(x,|\nabla u|)\nabla u),u' \rangle = \frac{d}{dt}\int_\Omega F(x,|\nabla u|)\,dx.
\]

Consider the following integral separately:

\[
I_5 = \int_\Omega \left(\nabla u',\frac{\partial}{\partial t}[\phi_1(x,|\nabla u|)\nabla u]\right)\,dx \\
= \int_\Omega (\nabla u',\nabla u')\phi_1(x,|\nabla u|)\,dx + \int_\Omega (\nabla u',\nabla u)\phi'_{1s}(x,s)|_{s=|\nabla u|}\frac{\partial}{\partial t}|\nabla u|\,dx \\
= \int_\Omega \phi_1(x,|\nabla u|)|\nabla u'|^2\,dx + \int_\Omega \phi'_{1s}(x,s)|_{s=|\nabla u|}\frac{\partial}{\partial t}|\nabla u|\frac{1}{2}\frac{\partial}{\partial t}|\nabla u|^2\,dx \\
= \int_\Omega \phi_1(x,|\nabla u|)|\nabla u'|^2\,dx + \int_\Omega \phi'_{1s}(x,s)|_{s=|\nabla u|}|\nabla u|\left[\frac{\partial}{\partial t}|\nabla u|\right]^2\,dx \geq 0,
\]

where the last inequality holds true by (3.3). Together with (3.42), this shows that

\[
\frac{1}{2}\frac{d}{dt}J + \frac{1}{2}\frac{d}{dt}\int_\Omega |\nabla u|^2\,dx \leq \frac{d}{dt}\int_\Omega F(x,|\nabla u|)\,dx, \\
\tag{3.43}
\]

\[
F(x,|\nabla u|) = \int_0^{|\nabla u|} s\phi_2(x,s)\,ds.
\]

We introduce the following notation:

\[
E(t) \equiv \int_\Omega F(x,|\nabla u|)\,dx - \frac{1}{2}J(t) - \frac{1}{2}\int_\Omega |\nabla u|^2\,dx. \\
\tag{3.44}
\]

Clearly,

\[
E(t) \geq E(0). \\
\tag{3.45}
\]

Now, we impose the first condition on the initial data:

\[
E(0) = \int_\Omega F(x,|\nabla u_0|)\,dx - \frac{1}{2}\int_\Omega |\Delta u_0|^2\,dx - \frac{1}{2}\int_\Omega |\nabla u_1|^2\,dx - \frac{1}{2}\int_\Omega |\nabla u_0|^2\,dx \geq 0. \\
\tag{3.46}
\]

Together with (3.45), this yields

\[
E(t) \geq 0 \quad \text{for all} \quad t \in [0,T]. \\
\tag{3.47}
\]

Using property (iii) for \(\phi_2(x,s)\) and (3.47), we deduce the inequality

\[
\int_\Omega |\nabla u|^2\phi_2(x,|\nabla u|)\,dx \geq \frac{\sigma}{2}J(t) + \frac{\sigma}{2}\int_\Omega |\nabla u|^2\,dx. \\
\tag{3.48}
\]
Combining this with (3.36), we obtain

\[
\Phi'' - \left(1 + \frac{\vartheta}{2}\right)J + \varepsilon J + \frac{4c_1^2}{\varepsilon} \Phi + \frac{c_2^2 c_5^2 2^{q/2}}{\varepsilon} \Phi^{1+q_1} + \left(1 - \frac{\vartheta}{2}\right) \int_\Omega |\nabla u|^2 \, dx \\
\geq \int_\Omega |\nabla u|^2 \phi_2(x,|\nabla u|) \, dx - \frac{\vartheta}{2} J(t) - \frac{\vartheta}{2} \int_\Omega |\nabla u|^2 \, dx \geq 0.
\]

Since \( \vartheta > 2 \), it follows that

\[
\left(1 + \frac{\vartheta}{2} - \varepsilon\right) J \leq \Phi'' + \frac{c_7^2}{\varepsilon} \Phi + \frac{c_6}{\varepsilon} \Phi^{1+q_1}, \quad q_1 = p_1 - 2,
\]

provided

\[
\frac{1}{2} \left(1 + \frac{\vartheta}{2} - \varepsilon\right) > 1 \Rightarrow \varepsilon \in \left(0, \frac{\vartheta - 2}{2}\right).
\]

Inequalities (3.49) and (3.22) lead to the following first order ordinary differential inequality:

\[
\Phi\Phi'' - \alpha (\Phi')^2 + \beta \Phi^2 + \gamma \Phi^{2+q_1} \geq 0, \quad q_1 = p_1 - 2,
\]

where

\[
\alpha = \frac{1}{2} \left(1 + \frac{\vartheta}{2} - \varepsilon\right), \quad \beta = \frac{c_7^2}{\varepsilon}, \quad \gamma = \frac{c_6}{\varepsilon}, \quad \varepsilon \in \left(0, \frac{\vartheta - 2}{2}\right), \quad \vartheta > 2.
\]

We introduce the new function

\[
\Psi = \Phi^{1-\alpha}.
\]

Dividing the two sides of (3.50) by \( \Phi^{1+\alpha} \geq 0 \) (see the definition (3.20)), we arrive at the inequality

\[
\Phi'' \Phi^{1-\alpha} - \alpha (\Phi')^2 \Phi^{1+\alpha} - \beta \Phi^{1-\alpha} + \gamma \Phi^{1+q_1 - \alpha} \geq 0
\]

\[
\Rightarrow \frac{d}{dt} \left[ \frac{\Phi'}{\Phi^{1+\alpha}} \right] + \beta \Phi^{1-\alpha} + \gamma \Phi^{1+q_1 - \alpha} \geq 0
\]

\[
\Rightarrow \frac{1}{1 - \alpha} \frac{d^2}{dt^2} \Phi^{1-\alpha} + \beta \Phi^{1-\alpha} + \gamma \Phi^{1+q_1 - \alpha} \geq 0.
\]

Invoking the notation (3.51), we obtain

\[
\frac{1}{1 - \alpha} \Psi'' + \beta \Psi + \gamma \Psi^{(1+q_1-\alpha)/(1-\alpha)} \geq 0.
\]

Now, we impose another assumption on the initial data:

\[
\Phi'(0) = \int_\Omega (\nabla u_1, \nabla u_0) \, dx + \int_\Omega \Delta u_1 \Delta u_0 \, dx > 0.
\]

Since \( u(x,t) \in C^2([0,T];H^2(\Omega)) \) by assumption, we have \( \Phi(t) \in C^1([0,T]) \). Consequently, there is some moment \( t_1 > 0 \) with

\[
\Phi'(t) > 0 \quad \text{for all} \quad t \in [0,t_1].
\]

Observe that by (3.51) we have

\[
\Psi' = (1-\alpha) \Phi^{-\alpha} \Phi'.
\]

Since \( \alpha > 1 \), (3.54) shows that

\[
\Psi'(t) \leq 0 \quad \text{for all} \quad t \in [0,t_1].
\]
Then, multiplying (3.52) by \( \Psi' \), we arrive at
\[
\frac{1}{1 - \alpha} \Psi'' + \beta \Psi' \Psi + \gamma \Psi' \Psi^{(1 + q_1 - \alpha)/(1 - \alpha)} \leq 0 \quad \text{for all} \quad t \in [0, t_1],
\]
whence it follows that
\[
\Psi' \Psi'' \geq \beta (\alpha - 1) \Psi' \Psi + \gamma (\alpha - 1) \Psi' \Psi^{(1 + q_1 - \alpha)/(1 - \alpha)} \quad \text{for all} \quad t \in [0, t_1].
\]
This implies the inequality
\[
(3.57) \quad \frac{1}{2} \frac{d}{dt} (\Psi')^2 \geq \frac{\beta (\alpha - 1)}{2} \frac{d}{dt} \Psi^2 + \frac{\gamma (\alpha - 1)}{\delta} \frac{d}{dt} \Psi^\delta,
\]
where
\[
\delta = 1 + \frac{1}{1 - \alpha} q_1 - \alpha.
\]
We need to guarantee that \( \delta > 0 \). Observe that
\[
\delta > 0 \Rightarrow \frac{1 - \alpha + 1 + q_1 - \alpha}{1 - \alpha} > 0 \Rightarrow \frac{2\alpha - 2 - q_1}{\alpha - 1} > 0 \Rightarrow 2\alpha > q_1 + 2 \Rightarrow 1 + \frac{q_1 - 2\alpha - 2}{2} > 0 \Rightarrow q_1 > 2\alpha.
\]
Thus, we must impose yet another condition on the quantity \( \vartheta > 2 \) in (iii)\(_2\), specifically,
\[
(3.58) \quad \vartheta > 2 + 2q_1, \quad q_1 = p_1 - 2.
\]
Remark 3. Note that functions \( \phi_2(x, |\nabla u|) \) obeying (3.58) do exist. Indeed, let
\[
\phi_2(x, |\nabla u|) = |\nabla u|^{p_2 - 2} \quad \text{for} \quad q_2 > 2q_1,
\]
where \( q_1 = p_1 - 2 \) and \( q_2 = p_2 - 2 \). Then \( \vartheta = q_2 + 2 \) for this function, and (3.58) is fulfilled if \( q_2 > 2q_1 \).

Now, let (3.58) be true. We continue the analysis of inequality (3.57). After integration, it implies
\[
(3.59) \quad (\Psi')^2 \geq A^2 + \beta (\alpha - 1) \Psi^2 + \frac{2\gamma (\alpha - 1)}{\delta} \Psi^\delta \geq A^2,
\]
where
\[
(3.60) \quad A^2 \equiv (\Psi'(0))^2 - \beta (\alpha - 1) \Psi^2(0) - \frac{2\gamma (\alpha - 1)}{\delta} \Psi^\delta(0).
\]
We subject the initial data to yet another condition, namely,
\[
(3.61) \quad A^2 > 0.
\]
Taking the definition (3.51) of \( \Psi(t) \) into account, from (3.61) we obtain the following equivalent inequality:
\[
(\alpha - 1)^2 \Phi_0^{-2\alpha} (\Phi'(0))^2 - \beta (\alpha - 1) \Phi_0^{-2\alpha} \Phi_0^2 - \frac{2\gamma (\alpha - 1)}{\delta} \Phi_0^{-\delta \alpha} \Phi_0^\delta > 0,
\]
which implies
\[
(3.62) \quad (\Phi'(0))^2 > \frac{\beta}{\alpha - 1} \Phi_0^2 + \frac{2\gamma}{(\alpha - 1)\delta} \Phi_0^{(2 - \delta) + \delta}.
\]
Next, clearly,
\[
\alpha(2 - \delta) + \delta = 2\alpha + (1 - \alpha)\delta = 2\alpha + 1 - \alpha + 1 + q_1 - \alpha = 2 + q_1,
\]
\[
\delta (\alpha - 1) = \alpha - 1 - q_1 + \alpha = 2\alpha - q_1 - 2.
\]
So, (3.62) yields
\[
(3.63) \quad (\Phi'(0))^2 > \frac{\beta}{\alpha - 1} \Phi_0^2 + \frac{2\gamma}{2\alpha - q_1 - 2} \Phi_0^{2 + q_1}, \quad q_1 = p_1 - 2,
\]
where \(2\alpha - q_1 - 2 > 0\) provided that \(\vartheta > 2 + 2q_1\) and

\[
\varepsilon \in \left(0, \frac{\vartheta - 2q_1 - 2}{2}\right).
\]

**Remark 4.** Our immediate task is to show that the set of functions \(\phi_1(x,s)\) and \(\phi_2(x,s)\) and the initial data \(u_0(x), u_1(x)\) that satisfy (3.46), (3.53), and (3.63) is nonempty. Indeed, let \(2q_1 < q_2\) \((q_1 = p_1 - 2\) and \(q_2 = p_2 - 2\)) and, moreover, let \(q_3 \in (2q_1, q_2)\). We fix \(u_0(x) \in C_0^\infty(\Omega) \subset H_0^2(\Omega)\) (recall that \(\partial\Omega \in C^{4,\delta}\) with \(\delta \in (0,1]\)) such that \(\|\triangle u_0\|_2 > 0\) and consider the classical solution \(u_1(x) \in C^{4+\mu}(\Omega) \cap C_0^{(2)}(\Omega)\) of the following problem:

\[
\triangle^2 u_1(x) - \triangle u_1(x) = (|u_0|^{q_3/2} u_0)(x) \in C^\mu(\Omega), \quad \mu = \mu(q_3) \in (0,1],
\]

(3.64)

\[
u_1 |_{\partial\Omega} = \frac{\partial u_1}{\partial n_x}|_{\partial\Omega} = 0.
\]

Then (3.53) can be transformed to

\[
\Phi'(0) = \int_{\Omega} \triangle u_1 \triangle u_0 dx + \int_{\Omega} (\nabla u_1, \nabla u_0) dx
\]

\[
= \int_{\Omega} [\triangle^2 u_1 - \triangle u_1] u_0 dx = \int_{\Omega} |u_0|^{2+q_3/2} dx > 0,
\]

which is clearly true. Now, we verify (3.63). After a substitution, we arrive at the inequality

\[
\left(\int_{\Omega} |u_0|^{2+q_3/2} dx\right)^2 > \frac{\beta}{\alpha - 1} \Phi_0^2 + \frac{2\gamma}{2\alpha - q_1 - 2} \Phi_0^{2+q_1}.
\]

Now in place of \(u_0(x)\) we put \(ru_0(x)\), where \(r > 0\). Then (3.53) does not change, while the last inequality takes the form

\[
r^{4+q_3} \left(\int_{\Omega} |u_0|^{2+q_3/2} dx\right)^2 > r^4 \frac{\beta}{\alpha - 1} \Phi_0^2 + r^{4+2q_1} \frac{2\gamma}{2\alpha - q_1 - 2} \Phi_0^{2+q_1}.
\]

Since \(q_3 > 2q_1\), it follows that (3.44) is fulfilled for sufficiently large \(r > 0\). Finally, we analyze condition (3.47); for convenience, we reproduce it:

\[
\int_{\Omega} F(x,|\nabla u_0|) dx \geq \frac{1}{2} \int_{\Omega} |\nabla u_1|^2 dx + \frac{1}{2} \int_{\Omega} |\triangle u_1|^2 dx + \frac{1}{2} \int_{\Omega} |\nabla u_0|^2 dx.
\]

We put \(\phi_2(x,|\nabla u|) = |\nabla u|^{q_2}\) with \(q_2 = p_2 - 2\). Then after integration we obtain

\[
\int_{\Omega} F(x,|\nabla u_0|) dx = \frac{1}{q_2 + 2} \int_{\Omega} |\nabla u_0|^{q_2+2} dx.
\]

This yields the inequality

(3.65) \[\frac{1}{2} \int_{\Omega} |\nabla u_1|^2 dx + \frac{1}{2} \int_{\Omega} |\triangle u_1|^2 dx + \frac{1}{2} \int_{\Omega} |\nabla u_0|^2 dx \leq \frac{1}{q_2 + 2} \int_{\Omega} |\nabla u_0|^{q_2+2} dx.\]

Now we invoke the Green function \(K(x,y)\) for the linear nonhomogeneous problem (3.64). The Green function in question exists by the results of [5] (the corresponding Green operator acts as follows: \(K : C^\mu(\Omega) \rightarrow C^{4+\mu}(\Omega)\)). Then we have the following formula for \(u_1(x)\):

\[
u_1(x) = \int_{\Omega} K(x, y)(|u_0|^{q_3/2} u_0)(y) dy.
\]
Substituting this in (3.65) and replacing $u_0$ with $r u_0$, we obtain the inequality
\[
r^{2+q_3} \frac{1}{2} \int_\Omega \left| \nabla_x K(x, y)(|u_0|^{q_3/2} u_0)(y) \right| dy \ dx + \int_\Omega \left| \Delta_x K(x, y)(|u_0|^{q_3/2} u_0)(y) \right| dy + \frac{1}{q_2 + 2} \int_\Omega |\nabla u_0|^2 dx \\
\leq r^{q_2 + 2} \frac{1}{q_2 + 2} \int_\Omega |\nabla u_0|^2 dx.
\]
Clearly, this inequality is fulfilled for sufficiently large $r > 0$, because $q_3 < q_2$. Thus, conditions (3.46), (3.53), and (3.63) are compatible.

We continue the study of (3.59). This inequality implies
\[
(3.66) \quad |\Psi| \geq A > 0 \quad \text{for} \quad t \in [0, t_1].
\]
Consequently,
\[
-\Psi' \geq A > 0 \Rightarrow \Psi' \leq -A < 0 \quad \text{for all} \quad t \in [0, t_1].
\]
Now we recall that
\[
\Psi'(t) = (1 - \alpha)\Phi^{-\alpha} \Phi'(t).
\]
Therefore,
\[
(1 - \alpha)\Phi^{-\alpha} \Phi'(t) \leq -A \Rightarrow \Phi' \geq \frac{A}{\alpha - 1} \Phi^\alpha > 0,
\]
but this implies that, under condition (3.53), the quantity $\Phi'(t)$ remains strictly positive for the entire interval where the solution of the problem in question exists. Thus, (3.66) shows that
\[
\Psi'(t) \leq -A < 0 \quad \text{for all} \quad t \in [0, T_0),
\]
where $T_0$ is the time of existence for the solution. Integrating the last inequality, we arrive at
\[
\Psi(t) \leq \Psi_0 - At;
\]
therefore, after a finite time $T_0 \in [0, T_1]$, the function $\Psi(t)$ acquires a zero; here
\[
T_1 = \frac{\Phi_0^{1 - \alpha}}{A} > 0.
\]
Consequently,
\[
\limsup_{t \uparrow T_0} \Phi(t) = +\infty.
\]
Now, we must choose the parameter
\[
\varepsilon \in \left(0, \frac{\vartheta - 2q_1 - 2}{2}\right)
\]
in an optimal way. We choose
\[
\varepsilon_0 \in \left(0, \frac{\vartheta - 2q_1 - 2}{2}\right)
\]
so that the quantity
\[
Q_0 = Q_0(\varepsilon) = \frac{\beta}{\alpha - 1} + \frac{2\gamma}{2\alpha - q_1 - 2} \Phi_0^{q_1}, \quad q_1 = p_1 - 2,
\]
be the smallest possible. Clearly, $\varepsilon_0$ is a function of $\Phi_0$.

So, we have obtained the following result: under conditions (3.46), (3.53), (3.58), and (3.63), the strong generalized solution $u(x, t) \in C^2([0, T]; H_0^2(\Omega))$ of problem (2.11)–(2.13) in the sense of Definition 3 cannot exist globally in time. Now we want to show
that \( T_0 = T_0(u_0, u_1) > 0 \), i.e., the problem is solvable locally in time in the strong generalized sense whenever \( u_0, u_1 \in H_0^2(\Omega) \). This will be done in the next section.

\section*{4. Local solvability}

Problem (2.11)–(2.13) can be rewritten in the following form:

\begin{equation}
\frac{d^2}{dt^2} A\!u + \frac{d}{dt} B_1(u) + Lu = B_2(u),
\end{equation}

\[ u(0) = u_0, \quad u'(0) = u_1, \quad u_0(x), u_1(x) \in H_0^2(\Omega), \]

where

\begin{equation}
A \equiv \Delta^2 - \Delta, \quad B_1(u) \equiv -\text{div}(\phi_1(x, |\nabla u|)\nabla u),
\end{equation}

\begin{equation}
B_2(u) \equiv -\text{div}(\phi_2(x, |\nabla u|)\nabla u), \quad L \equiv -\Delta.
\end{equation}

We need to know that the operator

\[ A \equiv \Delta^2 - \Delta : H_0^2(\Omega) \to H^{-2}(\Omega) \]

is invertible, and that the inverse

\[ A^{-1} : H^{-2}(\Omega) \to H_0^2(\Omega) \]

is Lipschitz continuous. To prove this, we shall use the following version of the Browder–Minty theorem (see, e.g., \cite{1}).

\textbf{Browder–Minty theorem.} \textit{Suppose that an operator} \( A \) \textit{acting from a Banach space} \( \mathbb{W} \) \textit{to the strong dual} \( \mathbb{W}^* \) \textit{is radially continuous, strongly monotone, and coercive. Then} \( A \) \textit{admits a Lipschitz continuous inverse} \( A^{-1} : \mathbb{W}^* \to \mathbb{W} \).

Three notions are involved in this theorem. For completeness, we give the definitions.

\textbf{Definition 4.} \textit{An operator} \( A : \mathbb{W} \to \mathbb{W}^* \) \textit{is said to be radially continuous if for all} \( u, v \in \mathbb{W} \) \textit{the function}

\begin{equation}
\phi(s) = \langle A(u + sv), v \rangle
\end{equation}

\textit{belongs to} \( \mathbb{C}[0, 1] \), where \( \langle \cdot, \cdot \rangle \) \textit{denotes the pairing between} \( \mathbb{W} \) \textit{and} \( \mathbb{W}^* \).

\textbf{Definition 5.} \textit{An operator} \( A : \mathbb{W} \to \mathbb{W}^* \) \textit{is said to be strongly monotone if there is a constant} \( m > 0 \) \textit{such that}

\begin{equation}
\langle A(u) - A(v), u - v \rangle \geq m\|u - v\|^2,
\end{equation}

\textit{where} \( \| \cdot \| \) \textit{is the norm in} \( \mathbb{W} \).

\textbf{Definition 6.} \textit{An operator} \( A : \mathbb{W} \to \mathbb{W}^* \) \textit{is said to be coercive if there exists a function}

\[ \gamma(s) : \mathbb{R}_+^1 \to \mathbb{R}_+^1 \quad \lim_{s \to +\infty} \gamma(s) = +\infty, \]

\textit{such that}

\begin{equation}
\langle A(u), u \rangle \geq \gamma(\|u\|)\|u\| \quad \text{for all} \quad u \in \mathbb{W}.
\end{equation}

Now we must show that the operator \( A \) \textit{defined by (4.2)} is radially continuous, strongly monotone and coercive as a mapping from \( \mathbb{W} = H_0^2(\Omega) \) to \( \mathbb{W}^* = H^{-2}(\Omega) \), that is, \textit{it satisfies the assumptions of the Browder–Minty theorem.}

(I) \textit{We show that} \( A \) \textit{is radially continuous. Indeed, consider the expression}

\begin{align*}
\phi(s) &= \langle A(u + sv), v \rangle = \int_\Omega (\nabla (u + sv), \nabla v) \, dx + \int_\Omega (\Delta u + s\Delta v)\Delta v \, dx \\
&= \int_\Omega (\nabla u, \nabla v) \, dx + s \int_\Omega |\nabla v|^2 \, dx + \int_\Omega \Delta u \Delta v \, dx + s \int_\Omega |\Delta v|^2 \, dx.
\end{align*}
Clearly, \( \phi(s) \in \mathbb{C}[0, 1] \) for every \( u, v \in H_0^2(\Omega) \).

Hence, \( A : H_0^2(\Omega) \to H^{-2}(\Omega) \) is radially continuous.

(II) Next, we show that \( A \) is strongly monotone. Indeed, we have

\[ \langle A(u) - A(v), u - v \rangle = \int_{\Omega} |\nabla u - \nabla v|^2 \, dx + \int_{\Omega} |\triangle u - \triangle v|^2 \, dx \]
\[ \geq \int_{\Omega} |\triangle u - \triangle v|^2 \, dx = \| u - v \|^2, \]

where \( \| \cdot \| \) stands for the norm in \( H_0^2(\Omega) \). Thus, \( A : H_0^2(\Omega) \to H^{-2}(\Omega) \) is strongly monotone with constant \( m = 1 \).

(III) Finally, we prove that \( A \) is coercive. Indeed,

\[ \langle A(u), u \rangle = \int_{\Omega} |\nabla u|^2 \, dx + \int_{\Omega} |\triangle u|^2 \, dx \geq \int_{\Omega} |\triangle u|^2 \, dx = \| u \|^2. \]

Thus, \( A \) is coercive with \( \gamma(s) = s \).

Now, the Browder-Minty theorem is applicable to \( A : H_0^2(\Omega) \to H^{-2}(\Omega) \) (defined by (4.2)), yielding the statement that this operator admits a Lipschitz continuous inverse

\[ A^{-1} : H^{-2}(\Omega) \to H_0^2(\Omega). \]

We show that, moreover, the Lipschitz constant is equal to 1. By (II), we have

\[ \langle A(u) - A(v), u - v \rangle \geq \| u - v \|^2 \quad \text{for all} \quad u, v \in H_0^1(\Omega). \]

Since the norm \( \| \cdot \|_* \) of the strong dual \( H^{-2}(\Omega) \) to \( H_0^2(\Omega) \) is given standardly by

\[ \| f \|_* \equiv \sup_{\| v \| \leq 1} |\langle f, v \rangle|, \]

we obtain

\[ \| A(u) - A(v) \|_* \| u - v \| \geq \langle A(u) - A(v), u - v \rangle. \]

Indeed, (4.8) follows easily from (4.7), moreover, we have the general inequality

\[ |\langle f, w \rangle| \leq \| f \|_* \| w \|. \]

To prove (4.9), we observe that it is true if \( w = \vartheta \), the zero of \( H_0^2(\Omega) \); but if \( w \neq \vartheta \), then

\[ |\langle f, v \rangle| \leq \| f \|_* \quad \text{for all} \quad \| v \| \leq 1 \]

by (4.7). In particular, putting

\[ v = \frac{w}{\| w \|}, \]

we arrive at

\[ |\langle f, w \rangle| \leq \| f \|_* \| w \|. \]

Now, (4.8) is a consequence of (4.9) if we put

\[ f = A(u) - A(v), \quad w = u - v \]

in it. By (4.6) and (4.8), we see that

\[ \| u - v \| \leq \| A(u) - A(v) \|_* \quad \text{for all} \quad u, v \in H_0^2(\Omega). \]

Now, we put

\[ w_1 = A(u), \quad w_2 = A(v); \]

then, by (4.10) and the invertibility of \( A : H_0^2(\Omega) \to H^{-2}(\Omega) \) proved above, we arrive at the inequality

\[ \| A^{-1}(w_1) - A^{-1}(w_2) \| \leq \| w_1 - w_2 \|_* \quad \text{for} \quad w_1, w_2 \in H^{-2}(\Omega). \]
So, we have proved that the operator $A^{-1} : H^{-2}(\Omega) \to H^2_0(\Omega)$ is Lipschitz continuous with constant 1.

Since $A$ is invertible, for $u(x, t) \in C^2([0, T]; H^2_0(\Omega))$ we can introduce a new function $v = Au$ and rewrite problem (4.1) in the following equivalent form:

$$
\frac{d^2 v}{dt^2} + \frac{d}{dt} \mathcal{B}_1(A^{-1}v) + \mathcal{L}A^{-1}v = \mathcal{B}_2(A^{-1}v),
$$

$$
v_0 = v(0) = Au_0 \in H^{-2}(\Omega), \quad v_1 = v'(0) = Au_1 \in H^{-2}(\Omega).
$$

In the class $v(x, t) \in C^2([0, T]; H^{-2}(\Omega))$ for some $T > 0$, problem (4.12) is equivalent to the integral equation

$$
v(t) = w_1 + \int_0^t ds \mathcal{G}(v(s)), \quad w_1 = v_0 + \mathcal{B}_1(A^{-1}v_0)t,
$$

$$
\mathcal{G}(v)(s) \equiv v_1 - \mathcal{B}_1(A^{-1}v(s)) + \int_0^s ds \left[ -\mathcal{L}A^{-1}v(s) + \mathcal{B}_2(A^{-1}v(s)) \right].
$$

**Remark 5.** When deducing the integral equation (4.13), we have used the statement that $\mathcal{B}_1(w)$ is a continuous operator. This is true indeed: below we shall deduce this from property (iii)1.

We look for a solution of the integral equation (4.13) in the Banach space

$$
L^\infty(0, T; H^{-2}(\Omega)).
$$

We shall need the following bounded closed convex subset of this Banach space:

$$
\mathcal{V}_r \equiv \left\{ v \in L^\infty(0, T; H^{-2}(\Omega)) : \|v\| = \text{ess sup}_{t \in [0, T]} \|v\|_* \leq r \right\}
$$

for some $r > 0$, where $\| \cdot \|_*$ is the norm of the Banach space $H^{-2}(\Omega)$.

First, we need upper estimates for the operators

$$
\mathcal{B}_1(A^{-1}v) \quad \text{and} \quad \mathcal{B}_2(A^{-1}v)
$$

for $v \in \mathcal{V}_r$ in the norm $\| \cdot \|_*$. For the first operator, by the growth condition (ii)1, we can write

$$
\| \mathcal{B}_1(w) \|_* \leq c_8 \| \nabla w \|_p \phi_1(x, \| \nabla w \|_{p_1}) \|_{p_1} \leq c_8 \left[ c_1 \| \nabla w \|_{p_1} + c_2 \| \nabla w \|_{p_1}^{p_1-1} \right],
$$

$$
\leq c_9 \| \nabla w \|_{p_1} + c_{10} \| \nabla w \|_{p_1}^{p_1-1},
$$

$$
\leq \frac{p_1 - 2}{p_1 - 1} c_9 (p_1 - 1)/(p_1 - 2) + \frac{1}{p_1 - 1} \| \nabla w \|_{p_1}^{p_1-1} + c_{10} \| \nabla w \|_{p_1}^{p_1-1},
$$

$$
= c_{11} + c_{12} \| \nabla w \|_{p_1}^{p_1-1},
$$

where $\| \cdot \|_*$ stands for the norm in $L^*_r(\Omega)$. In the last inequality, we have used the fact that $p_1 > 2$ by (ii)1. We put $w = A^{-1}v \in H^2_0(\Omega)$. Then (4.16) yields

$$
\| \mathcal{B}_1(A^{-1}v) \|_* \leq c_{11} + c_{12} \| \nabla A^{-1}v \|_{p_1}^{p_1-1} \leq c_{11} + c_{13} \| A^{-1}v \|_{s_1}^{p_1-1} \leq c_{11} + c_{13} \| v \|_{s_1}^{p_1-1}
$$

(we have used the Lipschitz continuity of $A^{-1}$ with constant 1 and the chain (4.13) of continuous embeddings with dense images). So, we arrive at the estimate

$$
\| \mathcal{B}_1(A^{-1}v) \|_* \leq c_{11} + c_{13} \| v \|_{s_1}^{p_1-1} \quad \text{for all} \quad v \in H^{-2}(\Omega).
$$

The following estimate is proved similarly:

$$
\| \mathcal{B}_2(A^{-1}v) \|_* \leq c_{14} + c_{15} \| v \|_{s_1}^{p_2-1} \quad \text{for} \quad v \in H^{-2}(\Omega).
$$

Therefore, if $r$ is chosen so large that

$$
\| w_1 \|_* \leq \| v_0 \|_* + T \| \mathcal{B}_1(A^{-1}v_0) \|_* \leq \| v_0 \|_* + T c_{11} + T c_{13} \| v_0 \|_{s_1}^{p_1-1},
$$
we obtain
\[
\|w_1\|_* \leq \frac{r}{2};
\]
Now, we introduce the operator
\[
\mathbb{H}(v) \equiv w_1 + \int_0^t dsG(v)(s),
\]
where \(G(v)(s)\) is defined by (4.14). Then the integral equation (4.13) can be rewritten in the form
\[
v = \mathbb{H}(v).
\]
We show that the operator \(\mathbb{H}(v)\) defined by (4.21) acts from \(\mathbb{V}_r\) to \(\mathbb{V}_r\) and is a contraction on \(\mathbb{V}_r\) for sufficiently large \(r > 0\) and sufficiently small \(T > 0\).

First, we estimate the operator \(G(v)(s)\) defined by (4.14) from above. Observe that \(\mathbb{L}\) is bounded as an operator
\[
\mathbb{L} \equiv -\Delta : \mathbb{H}_r^2(\Omega) \subset \mathbb{H}_r^1(\Omega) \to \mathbb{H}_r^{-1}(\Omega) \subset \mathbb{H}_r^{-2}(\Omega);
\]
consequently, by (4.18) and (4.19), we obtain
\[
\|G(v)\|_*(s) \leq \|v_1\|_* + c_{11} + c_{13}\|v\|_{*1}^{p_1-1}(s)
\]
\[
+ \int_0^s d\sigma \left[ c_{16}\|v\|_*(\sigma) + c_{14} + c_{15}\|v\|_{*2}^{p_2-1}(\sigma) \right].
\]
Now we can estimate \(\mathbb{H}(v)\) as follows:
\[
\|\mathbb{H}(v)\| \leq \|w_1\|_* + T \left[ \|v_1\|_* + c_{11} + c_{13}\|v\|_{*1}^{p_1-1} \right] + T^2 \left[ c_{16}\|v\|_* + c_{14} + c_{15}\|v\|_{*2}^{p_2-1} \right]
\]
\[
\leq \frac{r}{2} + T \left[ \|v_1\|_* + c_{11} + c_{13}\|v\|_{*1}^{p_1-1} \right] + T^2 \left[ c_{16}\|v\|_* + c_{14} + c_{15}\|v\|_{*2}^{p_2-1} \right] \leq \frac{r}{2} + \|v\|_* \leq r
\]
if \(T > 0\) is sufficiently small and \(r > 0\) is sufficiently large. Thus,
\[
\mathbb{H} : \mathbb{V}_r \to \mathbb{V}_r.
\]
We prove that \(\mathbb{H}\) is a contraction on \(\mathbb{V}_r\) for small \(T > 0\) and large \(r > 0\). Indeed, let \(v_1, v_2 \in \mathbb{V}_r\). Using (iii)1 and (iv)2, we obtain
\[
\|\mathbb{H}(v_1) - \mathbb{H}(v_2)\| \leq T \|G(v_1) - G(v_2)\| \leq T \|\mathbb{B}_1(A^{-1}v_1) - \mathbb{B}_1(A^{-1}v_2)\|
\]
\[
+ T^2\|LA^{-1}v_1 - LA^{-1}v_2\| + T^2\|\mathbb{B}_2(A^{-1}v_1) - \mathbb{B}_2(A^{-1}v_2)\|
\]
\[
\leq Tc_{17} \text{ess sup}_{t \in [0,T]} \mu_1(R_1)\|A^{-1}v_1 - A^{-1}v_2\|_{1,p_1} + T^2c_{17} \text{ess sup}_{t \in [0,T]}\|A^{-1}v_1 - A^{-1}v_2\|
\]
\[
+ T^2c_{17} \text{ess sup}_{t \in [0,T]} \mu_2(R_2)\|A^{-1}v_1 - A^{-1}v_2\|_{1,p_2},
\]
where
\[
R_1 = \max \left\{ \|A^{-1}v_1\|_{1,p_1}, \|A^{-1}v_2\|_{1,p_1} \right\}, \quad R_2 = \max \left\{ \|A^{-1}v_1\|_{1,p_2}, \|A^{-1}v_2\|_{1,p_2} \right\},
\]
and \(\|\cdot\|_{1,p}\) stands for the norm in \(W_0^{1,p}(\Omega)\) for \(p > 2\). Using the continuous embedding
\[
\mathbb{H}_r^2(\Omega) \subset \mathbb{W}_0^{1,p}(\Omega) \quad \text{for} \quad N = 3 \quad \text{and} \quad p = (2,6),
\]
we continue (4.24) to obtain
\[
\|\mathbb{H}(v_1) - \mathbb{H}(v_2)\| \leq c_{17}c_{18}T\mu_1(c_{18}R)\|v_1 - v_2\|
\]
\[
+ c_{17}T^2\|v_1 - v_2\| + c_{19}c_{17}T^2\mu_2(c_{19}R)\|v_1 - v_2\|.
\]
We have used the Lipschitz continuity of \(A^{-1}\) with constant 1. In inequality (4.25), \(R = \max\{\|v_1\|, \|v_2\|\}\), \(c_{18}\) is the best constant for the embedding \(\mathbb{H}_r^2(\Omega) \subset \mathbb{W}_0^{1,p_1}(\Omega)\):
\[
\|w\|_{1,p_1} \leq c_{18}\|w\| \quad \text{for all} \quad w \in \mathbb{H}_r^2(\Omega),
\]
and $c_{19}$ is the best constant for the embedding $\mathbb{H}^2_0(\Omega) \subset \mathbb{W}^{1,p_2}_0(\Omega)$:

\[ \|w\|_{1,p_2} \leq c_{19}\|w\| \quad \text{for all} \quad w \in \mathbb{H}^2_0(\Omega). \]

Observe that $R \leq r$ because $v_1, v_2 \in V_r$. Now, we require that

\[ c_{18} c_{17} T\mu_1(c_{18} r) + c_{17} T^2 + c_{17} c_{19} T^2 \mu_2(c_{19} r) \leq \frac{1}{2}. \]

This can be ensured by choosing $T > 0$ sufficiently small. As a result, we arrive at the inequality

\[ \|\mathbb{H}(v_1) - \mathbb{H}(v_2)\| \leq \frac{1}{2}\|v_1 - v_2\|. \]

By the contraction mapping theorem, the operator equation (4.22) has a unique solution $v(x, t) \in L^{\infty}(0, T; \mathbb{H}^{-2}(\Omega))$. Now, we prove that the solution $v(t) \in L^{\infty}(0, T; \mathbb{H}^{-1}(\Omega))$ of the integral equation (4.13) can be extended to a maximal interval $[0, T_0)$, where either $T_0 = +\infty$ or $T_0 < +\infty$; in the latter case,

\[ \limsup_{t \uparrow T_0} \|v\|_*(t) = +\infty. \]

Indeed, consider the norm $\psi(T) \equiv \sup_{t \in [0, T]} \|v(t)\|_* (t)$. As a function of $T$, the function $\psi(T)$ is monotone nondecreasing. Therefore, as $T \uparrow T_0$, $\psi(T)$ has a limit, which is either finite or infinite. Suppose it is finite, and let $T' \in (0, T_0)$. Consider the following integral equations:

\[ v(T') = v_0 + \int_0^{T'} ds \bar{G}(v)(s), \quad \bar{G}(v)(s) = G(v)(s) + \mathbb{H}^{-1}(A^{-1}v_0), \]

where $G(v)(s)$ is defined by (4.14), and

\[ v(T' + t) = v(T') + \int_{T'}^{T' + t} ds \bar{G}(v)(s), \quad t > 0. \]

We introduce the function $w(t) = v(T' + t)$ and make the change of variables $\sigma = s - T'$ in the last integral. This results in the equation

\[ w(t) = v(T') + \int_0^t d\sigma \bar{G}(w)(\sigma), \quad t > 0. \]

We observe that

\[ \|v\|_*(T') \leq C < +\infty, \quad T' \in (0, T_0). \]

Since equation (4.29) is of the form (4.13), there exists a time moment $T^* = T^*(T')$ such that (4.29) has a solution on the interval $t \in (0, T^*)$. By (4.30), the function $T^* = T^*(T')$ has a positive minimum, which we denote by $T^*$. Now, we take $T' = T_0 - T^*/2$ for the role of new $T'$. So, problem (4.29) admits a solution on the interval $t \in (0, T^*)$. We substitute in (4.29) the expression for $v(T')$ given by (4.27), obtaining

\[ v(t_0) = v_0 + \int_0^{t_0} ds \bar{G}(v)(s), \quad t_0 = T' + t, \quad t \in (0, T^*). \]

By the above, there is a unique solution of problem (4.31) on the interval $t_0 \in (0, T' + T^*)$. By the choice $T' = T_0 - T^*/2$, we have $t_0 \in (0, T_0 + T^*/2)$. So, employing the same algorithm of extension in time, we draw the conclusion that $T_0 = +\infty$, contradicting our assumption that $T_0 < +\infty$. It follows that

\[ \lim_{T \uparrow T_0} \psi(T) = +\infty. \]
This immediately implies the relation
\[ \limsup_{t \uparrow T_0} \|v\|_*(t) = +\infty. \]

We prove that the solution \(v(x, t) \in L^\infty(0, T; H^{-2}(\Omega))\) belongs to \(C^{(2)}(0, T; H^{-2}(\Omega))\). We use the so-called “bootstrap” method. First, we show that
\[ v(x, t) \in C(0, T; H^{-2}(\Omega)). \]

Indeed, we have
\[ \|v(t_1) - v(t_2)\|_* \leq \int_{t_1}^{t_2} ds \|\tilde{G}(v)(s)\|_* \leq \|\tilde{G}(v)\|_1 \to 0 \quad \text{as} \quad t_1 \to t_2 \]

for all \(t_1, t_2 \in [0, T]\). Consequently, \(v(x, t) \in C(0, T; H^{-2}(\Omega))\). Now, we show that
\[ v(x, t) \in C^{(1)}(0, T; H^{-2}(\Omega)). \]

Indeed, for this we must prove that
\[ G(v)(s) \in C(0, T; H^{-2}(\Omega)). \]

Since \(v(x, t) \in C(0, T; H^{-2}(\Omega))\) and \(A^{-1}\) is Lipschitz continuous with constant 1, we have
\[ \|A^{-1}v(t_1) - A^{-1}v(t_2)\| \leq \|v(t_1) - v(t_2)\|_* \to 0 \quad \text{as} \quad t_1 \to t_2 \]

for all \(t_1, t_2 \in [0, T]\). Thus, \(A^{-1}v \in C(0, T; H^0_2(\Omega))\). On the other hand, by (iii) and (iv) for \(B_1(\cdot)\) and \(B_2(\cdot)\), we have
\[ \|B_1(A^{-1}v(t_1)) - B_1(A^{-1}v(t_2))\|_* \leq c_{21} \mu_1(c_{20} R) \|A^{-1}v(t_1) - A^{-1}v(t_2)\| \to 0 \]

as \(t_1 \to t_2\) for all \(t_1, t_2 \in [0, T]\). Thus,
\[ B_1(A^{-1}v(t)) \in C(0, T; H^{-2}(\Omega)). \]

Similarly,
\[ B_2(A^{-1}v(t)) \in C(0, T; H^{-2}(\Omega)). \]

Finally,
\[ \mathbb{L}A^{-1}v(t) \in C(0, T; H^{-2}(\Omega)) \]

because \(\mathbb{L} = -\Delta\) is linear and continuous as an operator acting as indicated below:

\[ \mathbb{L} \equiv -\Delta : H^2_0(\Omega) \subset H^1_0(\Omega) \to H^{-1}(\Omega) \subset H^{-2}(\Omega). \]

Therefore,
\[ G(v)(s) \in C(0, T; H^{-2}(\Omega)). \]

Consequently,
\[ H(v) \in C^{(1)}(0, T; H^{-2}(\Omega)), \]

and by (4.22) we obtain
\[ v(x, t) \in C^{(1)}(0, T; H^{-2}(\Omega)). \]

Now, we show that, in combination with the definition (4.14) of \(G(v)(s)\), this implies
\[ H(v) \in C^{(2)}(0, T; H^{-2}(\Omega)). \]

To this end, we need to know that
\[ B_1(A^{-1}v(t)) \in C^{(1)}(0, T; H^{-2}(\Omega)). \]

By the chain rule for the Fréchet derivative (Theorem 1), we have
\[ A^{-1}v(t) \in C^{(1)}(0, T; H^2_0(\Omega)), \]

because \(A^{-1} : H^{-2}(\Omega) \to H^2_0(\Omega)\) is a bounded linear operator. By (iii), the operator
\[ B_1(w) \equiv -\text{div}(\phi_1(x, |\nabla w|)\nabla w) : \mathbb{W}^{1,p_1}_0(\Omega) \to \mathbb{W}^{-1,p_1}(\Omega) \]
is Fréchet differentiable. Applying Theorem 1, we obtain
\[ \mathbb{H}_1(\mathbb{A}^{-1}v(t)) \in C^1(0, T; \mathbb{H}^{-2}(\Omega)). \]
Thus,
\[ G(v)(s) \in C^1(0, T; \mathbb{H}^{-2}(\Omega)), \]
but then
\[ \mathbb{H}(v) \in C^2(0, T; \mathbb{H}^{-2}(\Omega)). \]
Consequently, the operator identity \[ (4.22) \] shows that
\[ v(x, t) \in C^2(0, T; \mathbb{H}^{-2}(\Omega)). \]
But
\[ u = \mathbb{A}^{-1}v, \]
and the chain rule for Fréchet derivatives (Theorem 1) implies
\[ u(x, t) \in C^2([0, T]; \mathbb{H}^2(\Omega)). \]
Thus we have proved the following theorem.

**Theorem 2.** Suppose that conditions (i) – (iii) and (i)_2, (ii)_2, (iv)_2 are fulfilled; then for every \( u_0(x), u_1(x) \in H^2_0(\Omega) \) there exists \( T_0 = T_0(u_0, u_1) > 0 \) such that problem \( (2.11)-(2.13) \) admits a strong generalized solution \( u(x, t) \in C^2([0, T_0]; H^2_0(\Omega)) \) understood in the sense of Definition 3. Moreover, either \( T_0 = +\infty \) or \( T_0 < +\infty \), and in the latter case we have
\[ (4.32) \lim_{t \uparrow T_0} \|Au\|_*(t) = +\infty, \quad \mathbb{A} \equiv \Delta^2 - \Delta. \]

**Remark 6.** We discuss formula \( (4.32) \). Observe that
\[ \|Au\|_*(t) = \sup_{w \in H^2_0(\Omega), \|w\| \leq 1} |\langle Au, w \rangle| \]
\[ \leq \sup_{w \in H^2_0(\Omega), \|w\| \leq 1} \left| \int_{\Omega} (\nabla u, \nabla w) \, dx + \int_{\Omega} \Delta u \Delta w \, dx \right| \]
\[ \leq 2 \sup_{w \in H^2_0(\Omega), \|w\| \leq 1} \Phi^{1/2}[u](t)\Phi^{1/2}[w] \leq c_{22}\Phi^{1/2}[u](t), \]
where \( \Phi^{1/2}[u](t) \) is defined by \( (3.20) \). Next, we have the following lower estimate:
\[ (4.34) \|Au\|_*(t)\|u\|(t) \geq \langle Au(t), u(t) \rangle = 2\Phi(t). \]
On the other hand,
\[ \|u\|^2 = \int_{\Omega} |\Delta u|^2 \, dx, \]
and the definition \( (3.20) \) implies the upper estimate \( \|u\|^2(t) \leq 2\Phi(t) \). Combined with \( (3.34) \), this yields the inequality
\[ (4.35) \sqrt{2}\Phi^{1/2}[u](t)\|Au\|_*(t) \geq 2\Phi(t) \Rightarrow \|Au\|_*(t) \geq \sqrt{2}\Phi^{1/2}[u](t). \]
We have arrived at the two-sided estimate
\[ \sqrt{2}\Phi^{1/2}[u](t) \leq \|Au\|_*(t) \leq c_{22}\Phi^{1/2}[u](t). \]
So, expression \( (4.32) \) is equivalent to
\[ (4.36) \lim_{t \uparrow T_0} \Phi[u](t) = +\infty, \]
where the functional \( \Phi[u](t) \) is defined by \( (3.20) \).
Thus, Theorem 2 and the results of §3 imply the following statement, which is the principal result of the paper.

**Theorem 3.** Suppose that functions $\phi_1(x,s)$ and $\phi_2(x,s)$ satisfy (i)$_1$–(iii)$_1$ and (i)$_2$–(iv)$_2$, $u_0, u_1 \in H^2_0(\Omega)$, and the following conditions are fulfilled:

$$\vartheta > 2 + 2q_1, \quad q_1 = p_1 - 2,$$

$$\int_\Omega \mathcal{F}(x,|\nabla u_0|) \, dx \geq \frac{1}{2} \int_\Omega |\nabla u_1|^2 \, dx + \frac{1}{2} \int_\Omega |\nabla u_0|^2 \, dx + \frac{1}{2} \int_\Omega |\nabla u_0|^2 \, dx,$$

$$\mathcal{F}(x,s) = \int_s^\vartheta d\sigma \sigma \phi_2(x,\sigma),$$

$$\Phi'(0) > \left(\frac{\beta}{\alpha - 1} - \frac{2\gamma}{2\alpha - q_1 - 2} - \Phi_0^{2+q_1}\right)^{1/2}.$$

Then the existence time for the strong generalized solution is positive and bounded above:

$$T_0 \in (0, T_1], \quad T_1 = \frac{\Phi_0^{1-\alpha}}{A} > 0,$$

and

$$\limsup_{t \uparrow T_0} \Phi(t) = +\infty,$$

where

$$\Phi(t) \equiv \frac{1}{2} \int_\Omega |\nabla u|^2 \, dx + \frac{1}{2} \int_\Omega |\Delta u|^2 \, dx,$$

$$\Phi_0 = \Phi(0) = \frac{1}{2} \int_\Omega |\nabla u_0|^2 \, dx + \frac{1}{2} \int_\Omega |\nabla u_0|^2 \, dx,$$

$$\Phi'(0) = \int_\Omega (\nabla u_1, \nabla u_0) \, dx + \int_\Omega \Delta u_1 \Delta u_0 \, dx,$$

$$\alpha = \frac{1}{2} \left(1 + \frac{\vartheta}{2} - \varepsilon_0\right), \quad \beta = \frac{c_7}{\varepsilon_0}, \quad \gamma = \frac{c_6}{\varepsilon_0}, \quad \varepsilon_0 \in \left(0, \frac{\vartheta - 2 - 2q_1}{2}\right),$$

$$A^2 \equiv (\alpha - 1)^2 \Phi_0^{-2\alpha} (\Phi'(0))^2 - \beta(\alpha - 1)\Phi_0^{-2\alpha} \Phi_0^2 = \frac{2\gamma(\alpha - 1)}{\delta} \Phi_0^{-2\alpha} \Phi_0^\delta > 0,$$

$$\delta = 1 + \frac{1 + q_1 - \alpha}{1 - \alpha}$$

and $\varepsilon_0$ provides the minimum for the function

$$Q_0 = Q_0(\varepsilon) \equiv \frac{\beta}{\alpha - 1} + \frac{2\gamma}{2\alpha - q_1 - 2} \Phi_0^{q_1},$$

under the condition $\varepsilon_0 \in (0, (\vartheta - 2 - 2q_1)/2)$.

**§5. Conclusion**

It should be noted that, in the present paper, we have considered localized “sources” (described by $\phi_2(x,s)$) and “drains” (described by $\phi_1(x,s)$) in plasma. This is important from a physical viewpoint because sources and drains in real plasma are localized indeed. Much as in this paper, it is possible to derive the equation for nonlinear ion-sound waves in “magnetized” plasma. However, that equation is of the fourth order in time and involves a nonlinear elliptic operator at the second derivative with respect to time. As far as I know, such equations have not been investigated as yet.
