does not form an exception. The existence of G_8 when $p > 3$ may be proved in exactly the same manner as when $p = 3$. Each of the five groups G_1, G_3, G_5, G_7, G_8 is conformal with the abelian group of type $(m-3, 1, 1)$, G_2 and G_4 are conformal with the abelian group of type $(m-3, 2)$ while G_6 is conformal with the one of type $(m-1, 1)$. Four of these groups (G_1, G_2, G_5, G_6) contain invariant cyclic subgroups of order p^{m-2} while these subgroups are conjugate, in sets of p, in the remaining four groups.
