HANKEL OPERATORS ON THE BERGMAN SPACE OF BOUNDED SYMMETRIC DOMAINS

KEHE ZHU

Abstract. Let \( \Omega \) be a bounded symmetric domain in \( \mathbb{C}^n \) with normalized volume measure \( dV \). Let \( P \) be the orthogonal projection from \( L^2(\Omega, dV) \) onto the Bergman space \( L_a^2(\Omega) \) of holomorphic functions in \( L^2(\Omega, dV) \). Let \( \overline{P} \) be the orthogonal projection from \( L^2(\Omega, dV) \) onto the closed subspace of antiholomorphic functions in \( L^2(\Omega, dV) \). The “little” Hankel operator \( h_f \) with symbol \( f \) is the operator from \( L_a^2(\Omega) \) into \( L_a^2(\Omega, dV) \) defined by \( h fg = \overline{P}(fg) \). We characterize the boundedness, compactness, and membership in the Schatten classes of the Hankel operators \( h_f \) in terms of a certain integral transform of the symbol \( f \). These characterizations are further studied in the special cases of the open unit ball and the poly-disc in \( \mathbb{C}^n \).

1. Introduction

Let \( \Omega \) be a bounded symmetric domain in \( \mathbb{C}^n \) with (normalized) volume measure \( dV \). For any \( 1 \leq p < +\infty \), the Bergman space \( L_a^p(\Omega) \) consists of holomorphic functions in \( L^p(\Omega, dV) \). It is easy to see that \( L_a^p(\Omega) \) is a closed subspace of \( L^p(\Omega, dV) \). In particular, there exists an orthogonal projection \( P: L^2(\Omega, dV) \to L_a^2(\Omega) \).

Let \( K(z, w) \) be the Bergman kernel of \( \Omega \), then

\[
P f(z) = \int_{\Omega} K(z, w)f(w) dV(w).
\]

The above integral formula extends \( P \) to \( L^1(\Omega, dV) \). Let \( \overline{P} \) be the orthogonal projection from \( L^2(\Omega, dV) \) onto \( \overline{L_a^2(\Omega)} = \{ f : f \in L_a^2(\Omega) \} \), then

\[
\overline{P} f(z) = \int_{\Omega} \overline{K(z, w)}f(w) dV(w) = \int_{\Omega} K(w, z)f(w) dV(w).
\]

This formula also extends \( \overline{P} \) to \( L^1(\Omega, dV) \).

Given $\phi \in L^2(\Omega, dV)$, define two operators $H_\phi$ and $h_\phi$ with domain $L^2_a(\Omega)$ as follows:

$$H_\phi f = (I - P)(\phi f), \quad h_\phi f = \overline{P}(\phi f),$$

where $I$ is the identity operator. $H_\phi$ is called the Hankel operator with symbol $\phi$ and $h_\phi$ is called the reduced (or little) Hankel operator with symbol $\phi$. The word "reduced" (or little) is justified by the inequality

$$\overline{P} - P_0 < I - P,$$

where $P_0$ is the orthogonal projection (rank 1) from $L^2(\Omega, dV)$ onto the constants, that is

$$P_0 f(z) = \int_{\Omega} f(z) dV(z).$$

The main problems that we are interested in here are the following:

**Problem 1.** When are $h_\phi$ and $H_\phi$ bounded operators from $L^2_a(C^\infty)$ into $L^2(\Omega, dV)$?

**Problem 2.** When are $h_\phi$ and $H_\phi$ compact?

**Problem 3.** When are $h_\phi$ and $H_\phi$ in the Schatten-Von Neumann ideals $S_p$?

An immediate consequence of the inequality $\overline{P} - P_0 < I - P$ is that $H_\phi$ is bounded implies $h_\phi$ is bounded; $H_\phi$ is compact implies $h_\phi$ is compact; and $H_\phi$ is in $S_p$ implies $h_\phi$ is in $S_p$.

By now it is fairly well-known [2, 3] that the properties of $H_\phi$ and $H_\phi$ are governed by the Berezin transform. More specifically, for any $f$ in $L^1(\Omega, dV)$, the Berezin transform of $f$ is the function $Bf$ defined on $\Omega$ by

$$Bf(z) = \int_{\Omega} f(w)|k_z(w)|^2 dV(w),$$

where

$$k_z(w) = \frac{K(w, z)}{\sqrt{K(z, z)}}$$

is a unit vector in $L^2_a(\Omega)$ for each $z \in \Omega$. For any $\phi \in L^2(\Omega, dV)$, let

$$MO(\phi)(z) = [B(|\phi|^2)(z) - |B\phi(z)|^2]^{1/2}, \quad z \in \Omega.$$

$MO(\phi)$ describes a type of mean oscillation of $\phi$ in $\Omega$ [2, 3]. It was shown in [3] that

1. $H_\phi, H_\phi$ are bounded $\iff MO(\phi) \in BC$;
2. $H_\phi, H_\phi$ are compact $\iff MO(\phi) \in C_0$.

Here $BC$ is the space of bounded continuous functions on $\Omega$ and $C_0$ is the space of continuous functions on $\Omega$ vanishing on the boundary.
In view of the above results, we see that the Berezin transform carries a lot of information on the Hankel operators $H_\phi$. The main purpose of this article is to demonstrate that there exists a similar integral transform on $\Omega$ which carries a lot of information on the reduced Hankel operators. We give a unified treatment on the size estimates of $h_\phi$ using the integral transform $V$ defined below. It should be pointed out that [6] gives a fairly complete theory on reduced Hankel operators. However, the theory in [6] does not cover our results here because Hankel operators (forms) in [6] are defined on a different space (or at least for the main results there), namely, the space of square integrable holomorphic functions with respect to the measure $K(z, z)^{-1}dV(z)$.

The integral transform $V$ is defined as follows. Given $f$ in $L^1(\Omega, dV)$, $Vf$ is the function on $L^2$ defined by

$$Vf(z) = \lambda \int_{\Omega} f(w)k_z^2(w)dV(w), \quad z \in \Omega,$$

where

$$\lambda^{-1} = \int_{\Omega} K(z, z)^{-1}dV(z).$$

Note that in the definition of the Berezin transform we used $|k_z(w)|^2$, while in the definition of $V$ we used $k_z^2(w)$.

**Theorem.** Let $\Omega$ be any bounded symmetric domain in $\mathbb{C}^n$. If $\phi \in L^2(\Omega, dV)$ and $p \geq 1$, then

1. $h_\phi$ is bounded $\iff V\phi \in BC$;
2. $h_\phi$ is compact $\iff V\phi \in C_0$;
3. $h_\phi$ is in $S_p$ $\iff V\phi \in L^p(d\lambda)$, where $d\lambda(z) = K(z, z)dV(z)$.

Note that for $\phi \in L^2(\Omega, dV)$, we always have $h_\phi = h_{\overline{P}\phi}$, where $P$ is the Bergman projection. Thus in considering reduced Hankel operators, we can content ourselves with antiholomorphic symbols.

When $\phi$ is holomorphic in $\Omega$, $V\phi$ is "computable" in the most interesting cases. If $\Omega = B_n$ and $\phi$ is holomorphic in $B_n$, then we will show that $V\phi$ behaves like the functions

$$(1 - |z|^2)^{n+1} \frac{\partial^{n+1}}{\partial z^{\alpha}}(z) \quad (|\alpha| = n + 1),$$

where $\alpha = (\alpha_1, \ldots, \alpha_n)$ is an ordered $n$-tuple of nonnegative integers, $|\alpha| = \alpha_1 + \cdots + \alpha_n$, and

$$\frac{\partial^{n+1}\phi}{\partial z^{\alpha}}(z) = \frac{\partial^{n+1}\phi}{\partial z_1^{\alpha_1} \cdots \partial z_n^{\alpha_n}}(z)$$

for $|\alpha| = n + 1$. Therefore, we obtain

**Corollary 1** [6]. If $\phi$ is holomorphic in $B_n$ and $p \geq 1$, then

1. $h_\phi$ is bounded $\iff (1 - |z|^2)^{n+1} \frac{\partial^{n+1}\phi}{\partial z^{\alpha}}(z) \in BC$ for all $|\alpha| = n + 1$;
(2) $h_\phi$ is compact $\Leftrightarrow (1 - |z|^2)^{n+1} \frac{\partial^{n+1}}{\partial z^n}(z) \in C_0$ for all $|\alpha| = n + 1$;  
(3) $h_\phi$ is in $S_p$ $\Leftrightarrow (1 - |z|^2)^{n+1} \frac{\partial^{n+1}}{\partial z^n}(z) \in L^p(\Omega)$ for all $|\alpha| = n + 1$.

There is another case when we can "compute" $V_\phi$ for $\phi$ holomorphic, namely, when $\Omega = D^n$, the poly-disc in $\mathbb{C}^n$. For simplicity of notation, we will confine ourselves to the bidisc $D^2$. In this case, we show that $V_\phi$ is determined by the following five functions:

$$T_1\phi(z_1) = (1 - |z_1|^2)^2 \frac{\partial^2 \phi}{\partial z_1^2}(z_1, 0), \quad T_2\phi(z_2) = (1 - |z_2|^2)^2 \frac{\partial^2 \phi}{\partial z_2^2}(0, z_2),$$

$$T_3\phi(z_1) = (1 - |z_1|^2)^2 \frac{\partial^3 \phi}{\partial z_1^2 \partial z_2}(z_1, 0),$$

$$T_4\phi(z_2) = (1 - |z_2|^2)^2 \frac{\partial^3 \phi}{\partial z_1 \partial z_2^2}(0, z_2),$$

$$T_5\phi(z_1, z_2) = (1 - |z_1|^2)^2(1 - |z_2|^2)^2 \frac{\partial^4 \phi}{\partial z_1^2 \partial z_2^2}(z_1, z_2).$$

It is possible to use lower order derivatives here (as well as in the case of $B_n$) if we only consider $S_p$ for $p > 1$ [10, 12].

**Corollary 2.** If $p \geq 1$ and $\phi$ is holomorphic in $D^2$, then we have

1. $h_\phi$ is bounded $\Leftrightarrow T_i \phi \in BC(D)$ $(1 \leq i \leq 4)$, $T \phi \in BC(D^2)$;  
2. $h_\phi$ is compact $\Leftrightarrow T_i \phi \in C_0(D)$ $(1 \leq i \leq 4)$, $T \phi \in C_0(D^2)$;  
3. $h_\phi$ is in $S_p$ $\Leftrightarrow T_i \phi \in L^p(D^2, d\lambda)$ $(1 \leq i \leq 4)$, $T \phi \in L^p(D^2, d\lambda)$.

**2. Basic properties of the transform $V$**

In this section we collect the basic properties of the integral transform $V$ defined by

$$Vf(z) = \lambda \int_{\Omega} f(w)k_z^{-2}(w) dV(w).$$

**Lemma 1.** The operator $Q$ defined by

$$Qf(z) = \lambda \int_{\Omega} \frac{K(z, w)^2}{K(w, w)f(w)} dV(w)$$

is a bounded projection from $L^1(\Omega, dV)$ onto $L^1_\alpha(\Omega)$.

**Proof.** See [9] or use Fubini's theorem.

**Proposition 2.** If $f \in L^2(\Omega, dV)$, then

1. $Pf = Pf$;
2. $VPf = Vf$;
3. $V^2f = Vf$. 

License or copyright restrictions may apply to redistribution; see https://www.ams.org/journal-terms-of-use
Proof. All the equalities follow from Fubini's theorem and Lemma 1 as well as the reproducing property of the Bergman projection $P$. We check (1) for example.

$$PVf(z) = \int_{\Omega} K(z, w)Vf(w)dV(w)$$

$$= \int_{\Omega} K(z, w)dV(w)\lambda_{\Omega} \int_{\Omega} \frac{K(w, u)^2}{K(w, w)} f(u)dV(u)$$

$$= \lambda_{\Omega} \int_{\Omega} f(u)dV(u) \int_{\Omega} \frac{K(w, u)^2}{K(w, w)} K(z, w)dV(w)$$

(Lemma 1) $$= \int_{\Omega} f(u)\frac{K(u, z)}{K(u, u)}dV(u)$$

$$= \int_{\Omega} K(z, u)f(u)dV(u) = Pf(z).$$

The other two equalities can be checked similarly.

Proposition 3. $V$ is a bounded operator on $L^p(\Omega, d\lambda)$ for all $1 \leq p \leq +\infty$.

Proof. Since each $k_z$ is a unit vector in $L^2_\alpha(\Omega)$, we have

$$|Vf(z)| \leq \lambda_{\Omega} \int_{\Omega} |f(w)| |k_z(w)|^2 dV(w)$$

$$\leq \lambda_{\Omega} \|f\|_\infty \int_{\Omega} |k_z(w)|^2 dV(w)$$

$$= \lambda_{\Omega} \|f\|_\infty$$

for all $z \in \Omega$. Thus $\|Vf\|_\infty \leq \lambda_{\Omega} \|f\|_\infty$ and $V$ is bounded on $L^\infty(d\lambda)$.

If $p \geq 1$, then

$$|Vf(z)|^p \leq \lambda_{\Omega}^p \int_{\Omega} |f(w)|^p |k_z(w)|^2 dV(w)$$

since $|k_z(w)|^2 dV(w)$ is a probability measure for each $z \in \Omega$. Therefore,

$$\int_{\Omega} |Vf(z)|^p d\lambda(z) \leq \lambda_{\Omega}^p \int_{\Omega} K(z, z)dV(z) \int_{\Omega} |f(w)|^p \frac{|K(z, w)|^2}{K(z, z)} dV(w)$$

$$= \lambda_{\Omega}^p \int_{\Omega} |f(w)|^p dV(w) \int_{\Omega} |K(z, w)|^2 dV(z)$$

$$= \lambda_{\Omega}^p \int_{\Omega} |f(w)|^p K(w, w)dV(w)$$

$$= \lambda_{\Omega}^p \int_{\Omega} |f(w)|^p d\lambda(w).$$

Proposition 4. $V$ is an orthogonal projection on the Hilbert space $L^2(\Omega, d\lambda)$.

Proof. Since $V$ is a bounded operator on $L^2(d\lambda)$, it suffices to check that $V^2 = V$ and $V^* = V$ on $L^2(d\lambda)$, where $V^*$ is the adjoint of $V$ on $L^2(d\lambda)$. 

License or copyright restrictions may apply to redistribution; see https://www.ams.org/journal-terms-of-use
\( V^2 = V \) follows from Proposition 2. To prove \( V^* = V \) on \( L^2(d\lambda) \), it suffices to prove \( \langle Vf, g \rangle_\lambda = \langle f, Vg \rangle_\lambda \) for all \( f, g \in L^2(d\lambda) \), where \( \langle \cdot, \cdot \rangle_\lambda \) is the (complex) integral pairing with respect to the measure \( d\lambda \). Once again, Fubini's theorem gives what we want:

\[
\langle Vf, g \rangle_\lambda = \lambda_\Omega \int \frac{g(z)}{\lambda(z)} f(w) dV(w) = \lambda_\Omega \int f(w) dV(w) \int \frac{K(z, w)^2}{K(z, w)} g(z) dV(z) = \int f(w) \frac{d\lambda(z)}{K(z, w)} g(z) dV(z) = \int f(w) \frac{d\lambda(w)}{K(w, w)} g(z) dV(z) = \langle f, Vg \rangle_\lambda.
\]

Remark 1. The boundedness of \( V \) on \( L^p(d\lambda) \) (\( 1 \leq p \leq +\infty \)) implies that

\[
\langle Vf, g \rangle_\lambda = \langle f, Vg \rangle_\lambda
\]

for all \( f \in L^p(d\lambda), \ g \in L^q(d\lambda) \) with \( \frac{1}{p} + \frac{1}{q} = 1 \), \( 1 \leq p \leq \infty \).

Remark 2. Under the usual integral pairing \( \langle \cdot, \cdot \rangle \) (with respect to \( dV \)), we have

\[
V^* f(z) = \lambda_\Omega \int \frac{K(z, w)^2}{K(w, w)} f(w) dV(w) = Qf(z),
\]

where \( Q \) is the operator in Lemma 1.

Proposition 5. For any \( \phi \in L^2(\Omega, dV) \), we have

1. \( h_{\phi} = h_{V\phi} \);
2. \( h_{\phi} = h_{V\phi} \);
3. \( V\phi(z) = \lambda_\Omega \langle h_{\phi}, z \rangle \).

Proof. (1) and (3) follow directly from the definitions of \( h_{\phi} \) and \( V \). (2) is a consequence of (1) and Proposition 2:

\[
h_{\phi} = h_{F\phi} = h_{FV\phi} = h_{V\phi}.
\]

Proposition 6. \( V : C(\overline{\Omega}) \to C_0(\Omega) \), where \( C(\overline{\Omega}) \) is the space of complex functions on \( \Omega \) which extend to \( \overline{\Omega} \) (the Euclidean closure of \( \Omega \)) continuously.

Proof. We will obtain this in §4 as a corollary. We give an alternative proof here in the special case \( \Omega = B_n \). Let \( \{\phi_z : z \in \Omega\} \) be the collection of auto-
morphisms defined in [8], then a change of variable gives

\[ Vf(z) = \lambda_\Omega \int_{\Omega} f(w)k_z(w)^2 \, dV(w) \]

\[ = \lambda_\Omega \int_{\Omega} f \circ \phi_z(w)k_z^2(\phi_z(w))k_z(w)^2 \, dV(w) \]

\[ = \lambda_\Omega \int_{\Omega} f \circ \phi_z(w)k_z(w)^2 \, dV(w) \]

\[ = \lambda_\Omega \int_{\Omega} f \circ \phi_z(w)k_z(w)K(w, z) \, dV(w). \]

If \( f \in C(\overline{\Omega}) \) and \( z_0 \in \partial \Omega \), then

\[ \lim_{z \to z_0} f \circ \phi_z(w) = f(z_0) \]

for each \( w \) since

\[ \lim_{z \to z_0} \phi_z(w) = z_0 \]

uniformly on compact sets. Therefore, by dominated convergence, we have

\[ \lim_{z \to z_0} Vf(z) = \lambda_\Omega f(z_0) \int_{\Omega} K(w, z_0) \, dV(w). \]

The reproducing property of \( K \) now gives

\[ \int_{\Omega} K(w, z_0) \, dV(w) = \lim_{r \to 1^-} \int_{\Omega} K(w, rz_0) \, dV(w) \]

\[ = \lim_{r \to 1^-} \frac{1}{K(rz_0, rz_0)} = 0. \]

3. BOUNDEDNESS OF \( h_\overline{\phi} \)

**Proposition 7.** If \( \phi \in L^2(\Omega, dV) \), then \( h_\overline{\phi} \) is bounded if and only if \( V\phi \in BC \).

In this case, we have

\[ \|h_\overline{\phi}\| \leq \|V\phi\|_{\infty} \leq \lambda_\Omega \|h_\overline{\phi}\|. \]

**Proof.** Since

\[ \overline{V\phi(z)} = \lambda_\Omega (h_\overline{\phi}k_z, k_z) \]

and \( k_z \) is a unit vector for each \( z \), we must have \( |V\phi(z)| \leq \lambda_\Omega \|h_\overline{\phi}\| \) for all \( z \), and hence \( \|V\phi\|_{\infty} \leq \lambda_\Omega \|h_\overline{\phi}\| \). On the other hand, we have by Proposition 5 \( \|h_\overline{\phi}\| = \|h_\overline{V\phi}\| \). It is easy to see that \( \|h_\psi\| \leq \|\psi\|_{\infty} \) for all \( \psi \in L^\infty \). Thus we also have \( \|h_\overline{\phi}\| \leq \|V\phi\|_{\infty} \).

**Theorem 8** [10]. If \( \phi \) is holomorphic and in \( L^2(\Omega, dV) \), then the following are equivalent:

1. \( h_\overline{\phi} \) is bounded;
(2) \( V \phi \in BC(\Omega) \);
(3) \( \phi \in PL^\infty(\Omega) \);
(4) \( | \int_\Omega f(z)\overline{\phi(z)}\,dV(z) | \leq C \int_\Omega |f(z)|\,dV(z) \) for some constant \( C > 0 \) and all \( f \in H^\infty(\Omega) \).

Moreover, the following quantities are equivalent: \( \|h_\phi\|, \|V\phi\|_\infty, \inf\{\|\psi\|_\infty : \phi = PV\psi\}, \sup\{ | \int_\Omega f(z)\overline{\phi(z)}\,dV(z) | : \|f\|_1 \leq 1, \, f \in H^\infty \} \), where \( \|f\|_1 = \int_\Omega |f(z)|\,dV(z) \).

**Proof.** The equivalence of (1) and (2) was proved in Proposition 7 along with the inequalities \( \|h_\phi\| \leq \|V\phi\|_\infty \leq \lambda_\Omega \|h_\phi\| \).

By Proposition 2, \( \phi \in L^2(\Omega, dV) \) is holomorphic implies that \( \phi = PV\phi \). Therefore \( \inf\{\|\psi\|_\infty : \phi = PV\psi\} \leq \|V\phi\|_\infty \).

If \( \phi = PV\psi \) with \( \psi \in L^\infty \), then \( \|h_\phi\| = \|h_{P\psi}\| = \|h_\psi\| \leq \|\psi\|_\infty \). This implies that \( \|h_\phi\| \leq \inf\{\|\psi\|_\infty : \phi = PV\psi\} \).

It is well-known [2] that for each \( z \in \Omega \), the function \( k_z(w) \) is holomorphic in a neighbourhood of \( \Omega \). In particular, \( k_z \in H^\infty \) for all \( z \in \Omega \). Thus

\[
\|V\phi\|_\infty = \sup\{ |V\phi(z)| : z \in \Omega \} = \lambda_\Omega \sup \left\{ \left| \int_\Omega \phi(w)\overline{k_z^2(w)}\,dV(w) \right| : z \in \Omega \right\} \leq \lambda_\Omega \sup \left\{ \left| \int_\Omega \phi(w)\overline{f(w)}\,dV(w) \right| : \|f\|_1 \leq 1, \, f \in H^\infty \right\}.
\]

Finally, if \( f \in H^\infty \) and \( \|f\|_1 \leq 1 \), then

\[
\int_\omega f(z)\overline{\phi(z)}\,dV(z) = \int_\Omega Qf(z)\overline{\phi(z)}\,dV(z) = \int_\Omega f(z)\overline{V\phi(z)}\,dV(z)
\]

by Remark 2 in the last section. It follows that

\[
\left| \int_\Omega f(z)\overline{\phi(z)}\,dV(z) \right| \leq \|V\phi\|_\infty \|f\|_1 \leq \|V\phi\|_\infty,
\]

completing the proof of Theorem 8.

**Corollary 9.** Let \( X = PL^\infty(\Omega) \) be equipped with the norm \( \|\phi\|_\ast = \|h_\phi\| \), then \( L^1_a(\Omega)^\ast = X \) with equivalent norms.

**Proof.** Suppose \( \xi \in L^1_a(\Omega)^\ast \), then the Hahn-Banach extension theorem implies that \( \xi \) can be extended to \( L^1(\Omega, dV) \) without increasing the norm. Since \( L^1(\Omega, dV)^\ast = L^\infty(\Omega) \), there must exist a function \( \psi \in L^\infty(\Omega) \) such that
\[ \|\xi\| = \|\psi\|_\infty \text{ and } \xi(f) = \int_\Omega f(z)\overline{\psi(z)}\,dV(z) \text{ for all } f \in L^1_a(\Omega). \]
Let \( \phi = P\psi \in X \), then for all \( f \in H^\infty \) (dense in \( L^1_a(\Omega) \)), we have
\[
\xi(f) = \int_\Omega f(z)\overline{\psi(z)}\,dV(z) \\
= \int_\Omega Pf(z)\overline{\psi(z)}\,dV(z) \\
= \int_\Omega f(z)P\overline{\psi(z)}\,dV(z) \\
= \int_\Omega f(z)\phi(z)\,dV(z).
\]
Moreover,
\[
\|\phi\|_* \leq \sup \left\{ \int_\Omega f(z)\overline{\phi(z)}\,dV(z) : f \in H^\infty, \|f\|_1 \leq 1 \right\} = \|\xi\|.
\]
Conversely, if \( \phi \in X \), then \( \phi \) induces a bounded linear functional \( \xi_\phi \) on \( L^1_a(\Omega) \) as follows:
\[
\xi_\phi(f) = \int_\Omega f(z)\overline{\phi(z)}\,dV(z), \quad f \in H^\infty \text{ (dense in } L^1_a(\Omega)).
\]
Moreover, we have
\[
\|\xi_\phi\| = \sup \left\{ \int_\Omega f(z)\overline{\phi(z)}\,dV(z) : f \in H^\infty, \|f\|_1 \leq 1 \right\} \leq \lambda_\Omega \|\phi\|_*.
\]
**Remark.** Since the dual of any Banach space is still a Banach space, thus \( X \) is complete in the norm \( \|\|_* \). Another way of seeing this is to consider \( X \) as a quotient space:
\[
P: L^\infty(\Omega) \to X.
\]
\( \|\|_* \) is equivalent to the quotient norm. The quotient space of any Banach space is still a Banach space.

### 4. Compactness of \( h_\phi \)

**Proposition 10.** Suppose \( \phi \in L^2(\Omega, dV) \) with \( V\phi \in BC \), then \( h_\phi \) is compact if and only if \( V\phi \in C_0 \) if and only if \( \phi \in C(\overline{\Omega}) \).

**Proof.** Since \( \overline{V\phi(z)} = \lambda_\Omega \langle h_\phi, k_z, \bar{k}_z \rangle \) and \( k_z \to 0 \) weakly as \( z \to \partial\Omega \), thus \( h_\phi \) is compact implies that \( V\phi \in C_0 \) which in turn implies that \( \phi \in C(\overline{\Omega}) \).

On the other hand, if \( V\phi \in C(\overline{\Omega}) \), then \( V\phi \) can be approximated in \( L^\infty(\Omega) \) by finite linear combinations of \( z^\alpha \bar{z}^\beta \) (Stone-Weierstrass). Since each \( h_{z^\alpha \bar{z}^\beta} \) is a finite rank operator and \( \psi \mapsto h_{V\psi} \) is norm continuous, \( h_{\overline{V\phi}} \) can be approximated in norm by finite linear combinations of finite rank operators. Hence \( h_\phi = h_{\overline{V\phi}} \) is compact.

**Corollary 11.** \( V: C(\overline{\Omega}) \to C_0(\Omega) \).

**Proof.** Suppose \( \phi \in C(\overline{\Omega}) \), then \( h_\phi \) is compact by the proof of Proposition 10. Thus \( V \in C_0(\Omega) \) by the proposition.
Theorem 12 [10]. If $\phi$ is holomorphic in $\Omega$ with $h_\phi$ bounded, then the following are equivalent:

1. $h_\phi$ is compact;
2. $V\phi \in C_0(\Omega)$;
3. $V\phi \in C(\overline{\Omega})$;
4. $\phi \in PC_0(\Omega)$;
5. $\phi \in PC(\overline{\Omega})$.

Proof. The equivalences of (1), (2), and (3) are in Proposition 10. $\phi = PV\phi$ gives the implication (2) $\Rightarrow$ (4). (4) $\Rightarrow$ (5) is trivial. If $\phi = P\psi$ with $\psi \in C(\overline{\Omega})$, then $h_\phi = h_\psi$ is compact by the Stone-Weierstrass argument used in the proof of Proposition 10, completing the proof of Theorem 12.

Recall that $X = PL^\infty(\Omega)$ is the Banach space with norm $\|f\|_\infty = \|h_\phi\|$. Let $X_0$ be the closed subspace of $X$ consisting of $f$ such that $h_\phi$ is compact. It is easy to see that the polynomials are dense in $X_0$ [10], thus $X_0$ is separable ($X$ is not!).

Corollary 13. $X_0^* = L_a^1(\Omega)$ with equivalent norms.

Proof. Suppose $f \in L_a^1(\Omega)$, then $f$ induces a bounded linear functional $\xi_f$ on $X$:

$$\xi_f(g) = \int_\Omega g(z)\overline{f(z)}\,dV(z), \quad g \in \mathcal{P},$$

where $\mathcal{P}$ is the set of polynomials (dense in $X_0$). By Corollary 9, $\|\xi_f\| \leq \lambda_\Omega \|f\|_1$.

Conversely, suppose that $\xi \in X_0^*$, we wish to find a function $f \in L_a^1(\Omega)$ such that $\xi = \xi_f$. Consider the mapping

$$V : X_0 \to C_0(\Omega).$$

By Proposition 7, $V$ is an imbeding, thus the image $VX_0$ is a closed subspace of $C_0(\Omega)$. Moreover,

$$\xi \circ V^{-1} : VX_0 \to C$$

is a bounded linear functional on $VX_0$ with norm $\leq \|V^{-1}\| \|\xi\|$ . Extend $\xi \circ V^{-1}$ to the space $C_0(\Omega)$ by the Hahn-Banach theorem. The Riesz representation theorem then produces a finite complex Borel measure $\mu$ on $\Omega$ such that

$$\xi \circ V^{-1}(f) = \int_\Omega f(z)\,d\mu(z)$$

for all $f$ in $VX_0$. It follows that

$$\xi(g) = \int_\Omega Vg(z)\,d\mu(z)$$
for all $g$ in $X_0$. If $g \in X_0$ is a polynomial, then Fubini’s theorem gives

$$
\xi(g) = \int d\mu(z) \lambda z \int K(z, w)^2 g(w) dV(w)
= \int g(w) dV(w) \lambda z \int K(z, w)^2 d\mu(z).
$$

Let

$$
f(w) = \lambda z \int K(w, z)^2 d\mu(z),
$$

then $f \in L^1_a(\Omega)$ with

$$
\|f\|_1 \leq \lambda z \int dV(w) \int K(w, z)^2 d\mu(z)
= \lambda z \int d\mu(z) \int K(w, z)^2 dV(w)
= \lambda z \int d\mu(z) = \xi(f) \leq \lambda z \|f\| \|V^{-1}\|.
$$

Moreover, we have

$$
\xi(g) = \int g(w) f(w) dV(w) = \xi_f(g)
$$
for all $g$ in $\mathcal{D}$ (dense in $X_0$). This completes the proof of Corollary 13.

**Remark.** The results in this section as well as the last section are mostly taken from [10]. The approach here is improved.

5. Schatten-Von Neumann class Hankel operators

Suppose $A$ is a bounded operator from $L^2_a(\Omega)$ into $L^2_a(\Omega)$, then $A^* A$ is a positive operator on the Hilbert space $L^2_a(\Omega)$. We say that $A$ is in the Schatten-Von Neumann $p$-ideal $S_p$ if $\text{tr}((A^* A)^{p/2})$ is finite. We will be mainly concerned with the case $1 \leq p < \infty$. In this case, each $S_p$ is a Banach space. We will write $S_{\infty}$ for the set of all bounded operators. Note that some authors write $S_{\infty}$ for the set of all compact operators. [5] contains a fair amount of information about the ideals $S_p$. We will need the interpolating property:

$$
[S_{\rho_0}, S_{\rho_1}]{\theta} = S_p
$$

if $1 \leq \rho_0 < \rho_1 \leq +\infty$ and $1/p = (1 - \theta)/\rho_0 + \theta/\rho_1$ for $\theta \in (0, 1)$, where $[\ , \ ]{\theta}$ is the functor of complex interpolation. The $L^p$-spaces also have the same interpolating properties:

$$
[L^{\rho_0}(d\mu), L^{\rho_1}(d\mu)]{\theta} = L^p(d\mu)
$$

if $1 \leq \rho_0 < \rho_1 \leq +\infty$ and $1/p = (1 - \theta)/\rho_0 + \theta/\rho_1$ with $\theta \in (0, 1)$. Any book on interpolation of Banach spaces should contain the above results.
Lemma 14. For $1 \leq p \leq +\infty$, we have

$$\phi \in L^p(d\lambda) \Rightarrow h_\phi \in S_p.$$  

Proof. The case $p = +\infty$ is clear. The case $p = 2$ is also easy. Recall that

$$h_\phi f(z) = \overline{P}(\phi f)(z) = \int_\Omega K(w, z)\phi(w)f(w)\,dV(w).$$

Thus $h_\phi$ is an integral operator with kernel $K(w, z)\phi(w)$ satisfying

$$\int_\Omega \int_\Omega |K(w, z)\phi(w)|^2\,dV(z)\,dV(w)$$

$$= \int_\Omega |\phi(w)|^2\,dV(w) \int_\Omega |K(z, w)|^2\,dV(z)$$

$$= \int_\Omega |\phi(w)|^2 K(w, w)\,dV(w)$$

$$= \|\phi\|_{L^2(d\lambda)}^2.$$

Therefore, $\phi \in L^2(d\lambda)$ implies $h_\phi \in S_2$. By complex interpolation, we have $\phi \in L^p(d\lambda)$ implies that $h_\phi \in S_p$ for all $2 < p < +\infty$. The case $1 \leq p \leq 2$ is a little more difficult. Again we will use complex interpolation. It suffices to check the endpoint $p = 1$. The method below is contained in [6].

First observe that

$$h_\phi = \int_\Omega \phi(w)h_{\overline{K}_w}\,dV(w),$$

where $K_w(z) = K(z, w)$. In fact, if $f \in L^2_2(\Omega)$, then

$$h_{\overline{K}_w} f(z) = \overline{P}(\overline{K}_w f)(z)$$

$$= \int_\Omega K(u, z)\overline{K}_w(u)f(u)\,dV(u)$$

$$= \int_\Omega K(u, z)K(w, u)f(u)\,dV(u)$$

$$= K(w, z)f(w) = f(w)\overline{K}_w(z),$$

and

$$\int_\Omega \phi(w)h_{\overline{K}_w} f(z)\,dV(w) = \int_\Omega \phi(w)f(w)\overline{K}_w(z)\,dV(w)$$

$$= \int_\Omega K(w, z)\phi(w)f(w)\,dV(w)$$

$$= h_\phi f(z).$$

Therefore, we have

$$h_\phi = \int_\Omega \phi(w)h_{\overline{K}_w}\,dV(w)$$

with each $h_{\overline{K}_w}$ being a rank 1 operator.
Suppose \( \phi \in L^1(\Omega, d\lambda) \), we wish to show that \( h_\phi \in S_1 \). It suffices to show that the above integral converges in \( S_1 \) (because \( S_1 \) is complete). Since \( h_{\overline{K}_w} \) is a rank 1 operator, we have

\[
\|h_{\overline{K}_w}\|_{S_1} = \|h_{\overline{K}_w}\|.
\]

Note that

\[
h_{\overline{K}_w} f = f(w)\overline{K}_w,
\]

thus

\[
\|h_{\overline{K}_w}\| = \sup\{\|f(w)\|_2; \|\overline{K}_w\|_2 = 1 \text{ in } L^2_d(\Omega)\}
\]

\[
= \sqrt{K(w, w)} \sup\{\|f(w)\|_2 = 1 \text{ in } L^2_d(\Omega)\}
\]

\[
= K(w, w).
\]

Therefore

\[
\int_\Omega \|\phi(w)h_{\overline{K}_w}\|_{S_1} dV(w) = \int_\Omega |\phi(w)| K(w, w) dV(w)
\]

\[
= \int_\Omega |\phi(w)| d\lambda(w) < +\infty
\]

if \( \phi \in L^1(d\lambda) \). This completes the proof of Lemma 14.

**Theorem 15.** Suppose \( 1 \leq p \leq \infty \) and \( V\phi \in BC \), then

\[
h_{\overline{\phi}} \in S_p \Rightarrow V\phi \in L^p(d\lambda).
\]

**Proof.** The case \( p = +\infty \) was settled in §3. Since \( h_\phi = h_{V\phi} \), Lemma 14 gives the implication \( V\phi \in L^p(d\lambda) \Rightarrow h_{\overline{\phi}} \in S_p \).

Suppose \( h_{\overline{\phi}} \in S_p \), then \((h_{\overline{\phi}}^*h_{\overline{\phi}})^{p/2} \in S_1 \). By [1] or [11],

\[
\tr[(h_{\overline{\phi}}^*h_{\overline{\phi}})^{p/2}] = \int_\Omega \langle (h_{\overline{\phi}}^*h_{\overline{\phi}})^{p/2} k_z, k_z \rangle K(z, z) dV(z).
\]

If \( p \geq 2 \), then the generalized Hölder inequality in [1] gives

\[
\tr[(h_{\overline{\phi}}^*h_{\overline{\phi}})^{p/2}] \geq \int_\Omega \langle h_{\overline{\phi}}^*h_{\overline{\phi}} k_z, k_z \rangle^{p/2} K(z, z) dV(z)
\]

\[
= \int_\Omega \|h_{\overline{\phi}} k_z\|^p K(z, z) dV(z).
\]

Since \( k_z \) is a unit vector, the Cauchy-Schwarz inequality gives

\[
\|h_{\overline{\phi}} k_z\| \geq |\langle h_{\overline{\phi}} k_z, \overline{K}_z \rangle| = \lambda_\Omega^{-1} |V\phi(z)|.
\]

Thus we get

\[
\lambda_\Omega \tr[(h_{\overline{\phi}}^*h_{\overline{\phi}})^{p/2}] \geq \int_\Omega |V\phi(z)|^p d\lambda(z)
\]

for all \( p \geq 2 \). This gives the implication \( h_{\overline{\phi}} \in S_p \Rightarrow V\phi \in L^p(d\lambda) \) for all \( p \geq 2 \).
The case $1 \leq p \leq 2$ is once again more difficult. We outline a method (used in [7]) to prove the implication $h_\varphi \in S_p \Rightarrow V f \in L^p(d\lambda)$ for all $1 \leq p < +\infty$.

(At least for the case of the open unit ball or the poly-disc in $\mathbb{C}^n$—added in proof.)

Fix a sequence of points $\{a_n\}$ in $\Omega$ such that

1. $\Omega = \bigcup_{n=1}^{\infty} E(a_n)$, where $E(a_n)$ is the Bergman metric ball with center $a_n$ and radius $r$ (some fixed positive number);

2. There exists a constant $C > 0$ such that every function $f$ in $L^2_2(\Omega)$ can be written as

$$f(z) = \sum_{n=1}^{\infty} \lambda_n k_{a_n}(z)$$

with

$$\|f\|_2 \leq C \inf \left\{ \sqrt{\sum_{n=1}^{\infty} |\lambda_n|^2} : f = \sum_{n=1}^{\infty} \lambda_n k_{a_n} \right\}.$$ 

For the construction of such a sequence $\{a_n\}$, see [4].

Define an operator $A$ on $L^2_a(\Omega)$ by letting

$$A e_n = k_{a_n}, \quad n = 1, 2, \ldots,$$

where $\{e_n\}$ is a fixed orthonormal basis of $L^2_a(\Omega)$. If $f \in L^2_a(\Omega)$ with $f = \sum_{n=1}^{\infty} f_n e_n$, then

$$Af = \sum_{n=1}^{\infty} f_n k_{a_n}$$

and by (2) above,

$$\|Af\| \leq C \inf \left\{ \sqrt{\sum_{n=1}^{\infty} |\lambda_n|^2} : Af = \sum_{n=1}^{\infty} \lambda_n k_{a_n} \right\}$$

$$\leq C \sqrt{\sum_{n=1}^{\infty} |f_n|^2} = C \|f\|.$$

Thus $A$ is a bounded linear operator. Let $\overline{A}$ be the operator on $L^2_a(\Omega)$ defined by $\overline{A} e_n = \overline{k}_{a_n}$, then $\overline{A}$ is also bounded.

Suppose $h_\varphi \in S_p$ with $p \geq 1$, then we also have $\overline{A}^* h_\varphi A \in S_p$. This implies that

$$\sum_{n=1}^{\infty} |\langle \overline{A}^* h_\varphi A e_n, \overline{e}_n \rangle|^p < +\infty,$$

or

$$\sum_{n=1}^{\infty} |\langle h_\varphi k_{a_n}, \overline{k}_{a_n} \rangle|^p < +\infty,$$
or
\[ \sum_{n=1}^{\infty} |V \phi(a_n)|^p < +\infty. \]

It is not difficult to show that [11] \( V \phi(z) \) behaves like \( V \phi(a_n) \) for \( z \in E(a_n) \). Also [11] \( K(z, z) \) behaves like \( K(a_n, a_n) \approx \frac{1}{E(a_n)} \) for \( z \) in \( E(a_n) \). It follows that
\[
\int_{E(a_n)} |V \phi(z)|^p d\lambda(z) \leq \sum_{n=1}^{\infty} \int_{E(a_n)} |V \phi(z)|^p K(z, z) dV(z)
\]
\[
\leq C_1 \sum_{n=1}^{\infty} \frac{1}{|E(a_n)|} \int_{E(a_n)} |V \phi(z)|^p dV(z)
\]
\[
\leq C_2 \sum_{n=1}^{\infty} \frac{1}{|E(a_n)|} \int_{E(a_n)} |V \phi(a_n)|^p dV(z)
\]
\[
= C_2 \sum_{n=1}^{\infty} |V \phi(a_n)|^p < +\infty,
\]
completing the proof of Theorem 15.

**Corollary 16.** Let \{a_n\} be as in the proof of the above theorem, then for all \( \phi \in L^2(\Omega, dV) \) we have

1. \( h_\phi \) is bounded \( \Leftrightarrow \{V \phi(a_n)\} \in l^\infty \);
2. \( h_\phi \) is compact \( \Leftrightarrow \{V \phi(a_n)\} \in c_0 \);
3. \( h_\phi \) is in \( S_p \) \( \Leftrightarrow \{V \phi(a_n)\} \in l^p, \; (p \geq 1) \).

**Corollary 17.** If \( \phi \) is holomorphic in \( \Omega \) with \( V \phi \in BC \), then for all \( p \geq 1 \), we have \( h_\phi \in S_p \) if and only if \( \phi \in PL_p(d\lambda) \).

**Proof.** If \( \phi = P \psi \) with \( \psi \in L^p(d\lambda) \), then
\[
h_\phi = h_\psi = h_\psi \in S_p
\]
by Lemma 14. Conversely, if \( h_\phi \in S_p \), then \( V \phi \in L^p(d\lambda) \) by Theorem 15. It follows that \( \phi = PV \phi \) is in \( PL_p(d\lambda) \).

6. **The open unit ball \( B_n \)**

In this section, we specialize to the special case \( \Omega = B_n \), the open unit ball in \( \mathbb{C}^n \). We show that if \( f \) is holomorphic in \( B_n \), then \( V f \) behaves like the following functions:
\[
(1 - |z|^2)^{n+1} \frac{\partial^{n+1} f}{\partial z^n}(z) \quad (|\alpha| = n + 1).
\]

To see why this is true, we first observe that for \( f \in L^2_a(\Omega) \),
\[
f(z) = \int_{B_n} \frac{f(w) dV(w)}{(1 - (z, w))^{n+1}},
\]
\[(1 - |z|^2)^{n+1} \frac{\partial^{n+1} f}{\partial z^\alpha}(z) = \frac{(2n + 1)!}{n!} \int_{B_n} \frac{(1 - |z|^2)^{n+1} \overline{w}^\alpha f(w)}{(1 - \langle z, w \rangle)^{2n+2}}.\]

On the other hand,

\[V f(z) = \lambda_B \int_{B_n} \frac{(1 - |z|^2)^{n+1} f(w)}{(1 - \langle z, w \rangle)^{2n+2}} dV(w).\]

Therefore, the only difference between \(V f(z)\) and \((1 - |z|^2)^{n+1} \frac{\partial^{n+1} f}{\partial z^\alpha}(z)\) (\(|\alpha| = n + 1\)) is the factor \(\overline{w}^\alpha\) in the integrand. It suggests that \(V f(z)\) should behave like the derivatives \((1 - |z|)^{n+1} \frac{\partial^{n+1} f}{\partial z^\alpha}(z)\) (\(|\alpha| = n + 1\)). The following theorem shows that this is indeed the case. Let

\[T_\alpha f(z) = (1 - |z|^2)^{n+1} \frac{\partial^{n+1} f}{\partial z^\alpha}(z) \quad (|\alpha| = n + 1).\]

**Theorem 18.** If \(f \in L^2_a(B_n)\) and \(p \geq 1\), then

1. \(V f \in B\mathcal{C} \Leftrightarrow T_\alpha f \in B\mathcal{C}\) for all \(|\alpha| = n + 1\);
2. \(V f \in C_0 \Leftrightarrow T_\alpha f \in C_0\) for all \(|\alpha| = n + 1\);
3. \(V f \in L^p(d\lambda) \Leftrightarrow T_\alpha f \in L^p(d\lambda)\) for all \(|\alpha| = n + 1\).

**Remark.** Since \(V f \in B\mathcal{C} \iff f \in PL^\infty(\Omega)\) and \(V f \in C_0 \iff f \in PC_0(\Omega)\), (1) and (2) above follow from the results in [12]. Our idea of proving (3) above is still the same as that in [12]. Although Theorem 18 is conceivably obvious in view of the observation proceeding it, we still need some technical lemmas to make the proof complete.

Recall that the fundamental theorem of calculus gives

\[f(z) - f(0) = \sum_{i=1}^{n} z_i \int_0^1 \frac{\partial f}{\partial z_i}(tz) dt.\]

Let

\[A_i f(z) = \int_0^1 \frac{\partial f}{\partial z_i}(tz) dt, \quad 1 \leq i \leq n.\]

For any \(n\)-tuple \(\alpha = (\alpha_1, \ldots, \alpha_n)\) of nonnegative integers, let

\[A_\alpha = A_1^{\alpha_1} \cdots A_n^{\alpha_n},\]

acting on holomorphic functions (the \(A_i's\) commute with each other).

**Lemma 19.** For all \(\sigma \leq 0\) and \(p \geq 1\), the operators \(A_\alpha\) are bounded on \(L^p_a(B_n, K(z, z)^\sigma dV(z))\).

This is basically a Gleason problem [8]. It can either be proved by the method in [12], or be proved by using Cauchy integrals. Either way, it suffices to consider the operators \(A_1, \ldots, A_n\). The boundedness of \(A_\alpha\) follows from the boundedness of \(A_1, \ldots, A_n\). We omit the details here.
Corollary 20. There exists a constant $C > 0$ such that for all holomorphic $f$ with $\partial^{[\alpha]}f(0)/\partial z^\alpha = 0$ (for all $|\alpha| \leq n$) we have

$$f(z) = \sum_{|\alpha| = n+1} z^\alpha A_\alpha f(z).$$

Moreover, $\|K^{-1}A_\alpha f\|_{L^p(d\lambda)} \leq C\|K^{-1}f\|_{L^p(d\lambda)}$ for all $|\alpha| = n + 1$, where

$$K^{-1}f(z) = K(z, z)^{-1}f(z) = (1 - |z|^2)^{n+1}f(z).$$

We can now prove Theorem 18. Only (3) needs to be checked. Suppose $Vf \in L^p(d\lambda)$. The equality $f = PVf$ gives

$$f(z) = \int_{B_n} \frac{Vf(w)}{(1 - \langle z, w \rangle)^{n+1}} dV(w).$$

Differentiating under the integral sign leads to

$$\frac{\partial^{n+1}f}{\partial z^\alpha}(z) = \frac{(2n+1)!}{n!} \int_{B_n} \frac{(1 - |z|^2)^{n+1}w^\alpha Vf(w)}{(1 - \langle z, w \rangle)^{2n+2}} dV(w).$$

Let $M_\alpha$ be the operator defined by

$$M_\alpha f(z) = \frac{(2n+1)!}{n!} z^\alpha f(z) = (n+1)! \bar{z}^\alpha f(z),$$

then the above equality becomes

$$T_\alpha f = V M_\alpha V f.$$

Clearly, $M_\alpha$ is bounded on $L^p(d\lambda)$. Also by Proposition 3, $V$ is bounded on $L^p(d\lambda)$. Thus $Vf \in L^p(d\lambda)$ implies that $T_\alpha f = VM_\alpha(Vf) \in L^p(d\lambda)$ for all $|\alpha| = n + 1$.

Conversely, suppose $T_\alpha f(z) \in L^p(d\lambda)$ for all $|\alpha| = n + 1$. We wish to show that $Vf \in L^p(d\lambda)$ ($p \geq 1$). Since $Vg \in L^p(d\lambda)$ for all polynomials $g$. We may assume that $\partial^{[\alpha]}f(0)/\partial z^\alpha = 0$ for all $|\alpha| \leq n$. Thus

$$f(z) = \sum_{|\alpha|=n+1} z^\alpha f_\alpha(z),$$

where $f_\alpha(z) = A_\alpha f(z)$. In order to prove $Vf \in L^p(d\lambda)$, it suffices to show that there exists a constant $C > 0$ such that

$$|\langle Vf, g \rangle_\lambda| \leq C\|g\|_{L^q(d\lambda)}$$

for all $g \in L^q(d\lambda)$ with $1/p + 1/q = 1$. By the proof of Proposition 4,

$$\langle Vf, g \rangle_\lambda = \langle f, Vg \rangle_\lambda = \langle Vf, Vg \rangle_\lambda.$$

Write $Vg(z) = K(z, z)^{-1}\tilde{g}(z)$ with $\tilde{g}$ holomorphic. It suffices to produce a constant $C > 0$ such that

$$|\langle Vf, K^{-1}\tilde{g} \rangle_\lambda| \leq C\|K^{-1}\tilde{g}\|_{L^q(d\lambda)}.$$
Since \( \partial^{|\alpha|} f(0)/\partial z^\alpha = 0 \) (\(|\alpha| \leq n\)), \( K(z, z)^{-1} = (1 - |z|^2)^{n+1} \) is unitarily invariant, we must have
\[
\langle f, K^{-1} \tilde{g} \rangle_\lambda = \langle f, K^{-1} \tilde{g}_1 \rangle_\lambda
\]
where \( \tilde{g}(z) = \tilde{g}_0(z) + \tilde{g}_1(z) \) with
\[
\tilde{g}_1(z) = \sum_{|\alpha|=n+1} z^\alpha A_\alpha \tilde{g}(z).
\]

Let \( \tilde{g}_\alpha = A_\alpha \tilde{g} \), then
\[
\langle f, K^{-1} \tilde{g}_1 \rangle_\lambda = \sum_{|\alpha|=n+1} \int_\Omega f(z) \bar{z}^\alpha \tilde{g}_\alpha(z) dV(z)
\]
\[
= \frac{1}{(n+1)!} \sum_{|\alpha|=n+1} \langle f, M^*_\alpha g_\alpha \rangle
\]
\[
= \frac{1}{(n+1)!} \sum_{|\alpha|=n+1} \langle M^*_\alpha f, \tilde{g}_\alpha \rangle
\]
where \( \langle , \rangle \) is the usual pairing with respect to \( dV \) and \( M^*_\alpha f(z) = z^\alpha f(z) \).

Going back to the pairing \( \langle , \rangle_\lambda \), we get
\[
\langle f, K^{-1} \tilde{g} \rangle_\lambda = \frac{1}{(n+1)!} \sum_{|\alpha|=n+1} \langle M^*_\alpha f, K^{-1} \tilde{g}_\alpha \rangle_\lambda
\]
Since \( K^{-1} \tilde{g} \) is in the image of \( V \) and \( V \) is a projection in the pairing \( \langle , \rangle_\lambda \), we have
\[
\langle f, K^{-1} \tilde{g} \rangle_\lambda = \frac{1}{(n+1)!} \sum_{|\alpha|=n+1} \langle VM^*_\alpha f, K^{-1} \tilde{g}_\alpha \rangle_\lambda
\]
\[
= \frac{1}{(n+1)!} \sum_{|\alpha|=n+1} \langle T^*_\alpha f, K^{-1} \tilde{g}_\alpha \rangle_\lambda.
\]

It follows that
\[
|\langle f, K^{-1} \tilde{g} \rangle_\lambda| \leq \frac{1}{(n+1)!} \sum_{|\alpha|=n+1} \|T^*_\alpha f\|_{L^p(d\lambda)} \|K^{-1} \tilde{g}_\alpha\|_{L^q(d\lambda)}.
\]

By Corollary 20, we have
\[
|\langle f, K^{-1} \tilde{g} \rangle_\lambda| \leq C \sum_{|\alpha|=n+1} \|T^*_\alpha f\|_{L^p(d\lambda)} \|K^{-1} \tilde{g}\|_{L^q(d\lambda)},
\]
completing the proof of Theorem 18.

**Corollary 21.** Suppose \( p \geq 1 \) and \( \phi \) is holomorphic on \( B_n \), then

1. \( h_\phi \) is bounded \( \Leftrightarrow T^*_\alpha \phi \in BC \) for all \( |\alpha| = n + 1 \);
2. \( h_\phi \) is compact \( \Leftrightarrow T^*_\alpha \phi \in C_0 \) for all \( |\alpha| = n + 1 \);
3. \( h_\phi \) is in \( S_p \) \( \Leftrightarrow T^*_\alpha \phi \in L^p(d\lambda) \) for all \( |\alpha| = n + 1 \).
where
\[ T_a \phi(z) = (1 - |z|^2)^{n+1} \frac{\partial^{n+1} \phi}{\partial z^n} (z). \]

7. The poly-disc \( D^n \)

In this section we compute \( Vf \) for holomorphic functions \( f \) on the poly-disc \( D^n \) in \( \mathbb{C}^n \). For simplicity of notation we restrict our computation to the bidisc \( D^2 \) in \( \mathbb{C}^2 \). \( D \) will denote the open unit disc in \( \mathbb{C} \).

Recall that for \( f \) holomorphic in \( D^2 \) we have
\[ T_1 f(z_1) = (1 - |z_1|^2)^2 \frac{\partial^2 f}{\partial z_1 \partial z_2} (0, z_2), \quad T_2 f(z_2) = (1 - |z_2|^2)^2 \frac{\partial^2 f}{\partial z_2^2} (0, z_2), \]
\[ T_3 f(z_1) = (1 - |z_1|^2)^2 \frac{\partial^3 f}{\partial z_1^3} (z_1, 0), \quad T_4 f(z_2) = (1 - |z_2|^2)^2 \frac{\partial^3 f}{\partial z_2^3} (0, z_2), \]
\[ T f(z_1, z_2) = (1 - |z_1|^2)^2(1 - |z_2|^2)^2 \frac{\partial^4 f}{\partial z_1 \partial z_2^2} (z_1, z_2). \]

We will show that the above five functions describe the behaviour of \( Vf \). As a motivation, we first compare \( Vf \) with \( T f \). Writing \( f = Pf \) and differentiating under integral sign, we easily get
\[ T f(z) = 36(1 - |z|^2)^2(1 - |z_2|^2)^2 \int_D \frac{w_1 w_2 f(w_1, w_2)}{(1 - z_1 w_1)^4(1 - z_2 w_2)^4} dV(w). \]

By definition, we also have
\[ V f(z) = \lambda_{D^2}(1 - |z_1|^2)^2(1 - |z_2|^2)^2 \int_{D^2} \frac{f(w_1, w_2)}{(1 - z_1 w_1)^4(1 - z_2 w_2)^4} dV(w), \]
where \( \lambda_{D^2} = 3^2 = 9 \). Thus the only difference between \( T f \) and \( V f \) in the integral representation is the factor \( w_1 w_2 \) in the integrand. Therefore, \( T f \) and \( V f \) are really closely related. On the other hand, \( T f \) does not contain all the properties of \( V f \). For example, if \( f(z_1, z_2) \) only depends on one variable, say, \( f(z_1, z_2) = g(z_1) \), then \( T f = 0 \), but
\[ V f(z_1, z_2) = 9(1 - |z_1|^2)^2(1 - |z_2|^2)^2 \int_{D} \frac{g(w_1)}{(1 - z_1 \overline{w_1})^4} dV(w_1). \]

If \( g \) is not in the Bloch space of \( D \), then \( V f(z_1, z_2) \) is not even bounded, although \( T f \equiv 0 \). This explains why we need the functions \( T_i f \) \((1 \leq i \leq 4)\).

We point out that if we are only concerned with boundedness, compactness, or membership in \( S_p \), with \( p > 1 \), then it is sufficient to consider the following three lower order derivatives \([10, 12]\):
\[ (1 - |z_1|^2) \frac{\partial f}{\partial z_1} (z_1, 0), \quad (1 - |z_2|^2) \frac{\partial f}{\partial z_2} (0, z_2), \]
\[ (1 - |z_1|^2)(1 - |z_2|^2) \frac{\partial^2 f}{\partial z_1 \partial z_2} (z_1, z_2). \]
In order to cover the endpoint \( p = 1 \), we need all the five functions: \( T_i f \) (1 ≤ \( i \leq 4 \)) and \( T f \).

**Theorem 22.** Suppose \( p \geq 1 \) and \( f \) is holomorphic in \( \mathbb{D}^2 \), we have

1. \( V f \in BC \iff T_i f \in BC(\mathbb{D}) \) (1 ≤ \( i \leq 4 \)), \( T f \in BC(\mathbb{D}^2) \);
2. \( V f \in \mathbb{C}_0 \iff T_i f \in \mathbb{C}_0(\mathbb{D}) \) (1 ≤ \( i \leq 4 \)), \( T f \in \mathbb{C}_0(\mathbb{D}^2) \);
3. \( V f \in L^p(\mu) \iff T_i f \in L^p(\mathbb{D}, \mu) \) (1 ≤ \( i \leq 4 \)), \( T f \in L^p(\mathbb{D}^2, \mu) \).

Combining Theorems 8, 12, 15 and 22, we get

**Corollary 23.** Suppose \( p \geq 1 \) and \( \phi \) is holomorphic in \( \mathbb{D}^2 \), then we have

1. \( h_\phi \) is bounded \( \iff T_i \phi \in BC(\mathbb{D}) \) (1 ≤ \( i \leq 4 \)), \( T \phi \in BC(\mathbb{D}^2) \);
2. \( h_\phi \) is compact \( \iff T_i \phi \in \mathbb{C}_0(\mathbb{D}) \) (1 ≤ \( i \leq 4 \)), \( T \phi \in \mathbb{C}_0(\mathbb{D}^2) \);
3. \( h_\phi \) is in \( S_p \iff T_i \phi \in L^p(\mathbb{D}, \mu) \) (1 ≤ \( i \leq 4 \)), \( T \phi \in L^p(\mathbb{D}^2, \mu) \).

The proof of Theorem 22 is similar to that of Theorem 18.

Once again the three implications "\( \Rightarrow \)" are easier to prove. Given \( f \) holomorphic in \( \mathbb{D}^2 \) with \( V f \in BC \). Write \( f = PVf \) and differentiate under integral sign, then

\[
T f(z) = 36(1 - |z_1|^2)^2(1 - |z_2|^2)^2 \int_{\mathbb{D}^2} \frac{w_1^2 w_2^2 Vf(w_1, w_2)}{(1 - z_1 w_1)^4(1 - z_2 w_2)^4} dV(w).
\]

Let \( M \) be the operator defined by

\[
M f(z) = 4z_1^2 z_2^2 f(z)
\]
then we have

\[T f = VMV f.\]

\( M \) maps \( BC \) into \( BC \), \( \mathbb{C}_0 \) into \( \mathbb{C}_0 \), and \( L^p(\mu) \) into \( L^p(\mu) \), and so does \( V \), thus \( V f \in BC \) implies \( T f \in BC \), \( V f \in \mathbb{C}_0 \) implies \( T f \in \mathbb{C}_0 \), and \( V f \in L^p(\mu) \) implies \( T f \in L^p(\mu) \).

To get the same conclusions about \( T_1 f \) and \( T_2 f \), notice that \( f = PVf \) gives

\[T_1 f(z_1) = 6 \int_{\mathbb{D}^2} \frac{(1 - |z_1|^2)^2 w_1^2 Vf(w_1, w_2)}{(1 - z_1 w_1)^4} dV(w).
\]

Let

\[
\phi_1(w_1) = \int_{\mathbb{D}} Vf(w_1, w_2) dV(w_2),
\]
then

\[T_1 f(z_1) = 6(1 - |z_1|^2)^2 \int_{\mathbb{D}} \frac{\phi(w_1) dV(w_1)}{(1 - z_1 w_1)^4},
\]
with

\[|\phi_1(z_1)|^p \leq \int_{\mathbb{D}} |Vf(z_1, z_2)|^p dV(z_2) \leq \int_{\mathbb{D}} \frac{|Vf(z_1, z_2)|^p}{(1 - |z_2|^2)^2} dV(z_2).
\]
and
\[ \int_{\mathbb{D}} \frac{\lvert \phi_1(z_1) \rvert^p}{(1 - |z_1|^2)^2} dV(z_1) \leq \int_{\mathbb{D}} \int_{\mathbb{D}} \frac{|Vf(z_1, z_2)|^p}{(1 - |z_1|^2)^2(1 - |z_2|^2)^2} dV(z_1, z_2) \]
or
\[ \lVert \phi_1 \rVert_{L^p(\mathbb{D}, d\lambda)} \leq \lVert Vf \rVert_{L^p(\mathbb{D}^2, d\lambda)}. \]
Thus the result on \( \mathbb{D} = B_1 \) implies that \( T_1 f \in L^p(\mathbb{D}, d\lambda) \) if \( Vf \in L^p(\mathbb{D}^2, d\lambda) \).
Similarly, \( T_1 f \in C_0(\mathbb{D}) \) if \( Vf \in C_0(\mathbb{D}^2) \), \( T_1 f \in BC(\mathbb{D}) \) if \( Vf \in BC(\mathbb{D}^2) \). The case \( T_2 f \) can be treated similarly.

To get the results for \( T_3 f \) and \( T_4 f \), we write \( f = PVf \) and differentiate under integral sign, then we get
\[ T_3 f(z_1) = 12(1 - |z_1|^2)^2 \int_{\mathbb{D}^2} \frac{w_1^2 w_2 Vf(w_1, w_2)}{(1 - z_1 w_1)^4} dV(w), \]
Let
\[ \psi_1(w_1) = w_1^2 \int_{\mathbb{D}} w_2 Vf(w_1, w_2) dV(w_2), \]
then
\[ T_3 f(z_1) = 12(1 - |z_1|^2)^2 \int_{\mathbb{D}} \frac{\psi_1(w_1)}{(1 - z_1 w_1)^4} dV(w_1) \]
and \( \psi_1 \) satisfies the same estimate we did for \( \phi_1 \), thus the result on \( \mathbb{D} = B_1 \) gives the implication that \( Vf \in BC(\mathbb{D}^2) \iff T_3 f \in BC(\mathbb{D}) \), \( Vf \in C_0(\mathbb{D}^2) \iff T_3 f \in C_0(\mathbb{D}) \), and \( Vf \in L^p(\mathbb{D}^2, d\lambda) \iff T_3 f \in L^p(\mathbb{D}, d\lambda) \). The same proof works for \( T_4 f \). We have completed the proof for the three implications \( \Rightarrow \) in Theorem 22.

We will prove the converse only for (3). The other two statements can be proved similarly and details can be found in [10, 12].

Given \( f \) holomorphic in \( \mathbb{D}^2 \) with \( f(0) = 0 \), we can always write
\[ f(z_1, z_2) = h_1(z_1) + h_2(z_2) + z_1 z_2 (h_3(z_1) + h_4(z_2)) + z_1^2 z_2^2 h(z_1, z_2). \]
Moreover, the decomposition is unique if \( h_4(0) = 0 \). Since \( f(0) = 0 \), we have \( h_1(z_1) = f(z_1, 0), h_2(z_2) = f(0, z_2) \). Therefore,
\[ Vh_1(z_1, z_2) = 9(1 - |z_1|^2)^2(1 - |z_2|^2)^2 \int_{\mathbb{D}^2} \frac{h_1(w_1) dV(w)}{(1 - z_1 w_1)^4(1 - z_2 w_2)^4} = 9(1 - |z_2|^2)^2(1 - |z_1|^2)^2 \int_{\mathbb{D}} \frac{f_1(w_1, 0) dV(w_1)}{(1 - z_1 w_1)^4}. \]
The assumption that \( T_1 f \in L^p(\mathbb{D}, d\lambda) \) together with the results for \( \mathbb{D} = B_1 \) now gives \( Vh_1 \in L^p(\mathbb{D}^2, d\lambda) \). Similarly, \( T_2 f \in L^p(\mathbb{D}, d\lambda) \iff Vh_2 \in L^p(\mathbb{D}^2, d\lambda) \).

It is easy to see that
\[ \frac{\partial f}{\partial z_2}(z_1, 0) = h_2'(0) + z_1 h_3(z_1). \]
or
\[
z_2 \frac{\partial f}{\partial z_2}(z_1, 0) = h'_2(0)z_2 + z_1 z_2 h_3(z_1).
\]

It follows that
\[
V(z_1 z_2 h_3(z_1))(z_1, z_2) = V \left( z_2 \frac{\partial f}{\partial z_2}(z_1, 0) \right) (z_1, z_2) - h'_2(0)V(z_2)(z_1, z_2).
\]

Clearly, \( V(z_2)(z_1, z_2) \in L^p(\text{d}\lambda) \). Also we have
\[
V \left( z_2 \frac{\partial f}{\partial z_2}(z_1, 0) \right) (z_1, z_2)
= 9(1 - |z_1|^2)^2(1 - |z_2|^2)^2 \int_{\mathbb{D}} \frac{\partial f}{\partial w_3}(w_1, 0) w_2 dw V(w)
\]
\[
= 18z_2(1 - |z_2|^2)^2(1 - |z_1|^2)^2 \int_{\mathbb{D}} \frac{\partial f}{\partial w_2}(w_1, 0) \frac{dV(w)}{(1 - z_1 \overline{w}_1)(1 - z_2 \overline{w}_2)}.
\]

So \( T_3 f \in L^p(\mathbb{D}, \text{d}\lambda) \) together with the results on \( D = B_1 \) gives
\[
V \left( z_2 \frac{\partial f}{\partial z_2}(z_1, 0) \right) (z_1, z_2) \in L^p(\mathbb{D}^2, \text{d}\lambda).
\]

Therefore,
\[
V(z_1 z_2 h_3(z_1)) \in L^p(\mathbb{D}^2 \text{d}\lambda).
\]

Similarly,
\[
V(z_1 z_2 h_4(z_2)) \in L^p(\mathbb{D}^2, \text{d}\lambda).
\]

It remains to show that
\[
V(z_1 z_2 h(z_1, z_2)) \in L^p(\mathbb{D}^2, \text{d}\lambda).
\]

In doing this we may as well assume that
\[
f(z_1, z_2) = z_1^2 z_2^2 h(z_1, z_2).
\]

Given \( g \in L^q(\text{d}\lambda) \) with \( 1/p + 1/q = 1 \), then
\[
\langle Vf, g \rangle_{\lambda} = \langle f, Vg \rangle_{\lambda}.
\]

Write \( Vg(z) = K(z, z)^{-1} \tilde{g}(z) \) with
\[
\tilde{g}(z) = \tilde{g}(0) + \tilde{h}_1(z_1) + \tilde{h}_2(z_2) + z_1 z_2 (\tilde{h}_3(z_1) + \tilde{h}_4(z_2)) + z_1^2 z_2^2 \tilde{h}(z_1, z_2).
\]

The unitary invariance of \( K^{-1} \) and \( \text{d}\lambda \) now implies that
\[
\langle f, Vg \rangle_{\lambda} = \langle f(z), K(z, z)^{-1}z_1^2 z_2^2 \tilde{h}(z_1, z_2) \rangle_{\lambda}
= \langle z_1^2 z_2^2 f(z), K(z, z)^{-1} \tilde{h}(z) \rangle_{\lambda}.
\]

Because \( K^{-1} \tilde{h} \) is in the image of \( V \) and \( V \) is a projection in the pairing \( \langle \ , \ \rangle_{\lambda} \).
thus

\[ \langle f, Vg \rangle_\lambda = \langle V(z_1^2 z_2^2 f(z)), K^{-1}(z, z) \hat{h}(z) \rangle_\lambda = \frac{1}{4} \langle Tf, K^{-1} \hat{h} \rangle_\lambda. \]

It follows that

\[ |\langle f, Vg \rangle_\lambda| \leq \frac{1}{4} \| Tf \|_{L^p(d\lambda)} \| K^{-1} \hat{h} \|_{L^q(d\lambda)}. \]

The desired result now follows from the following.

Lemma 24. Suppose \( g \) is holomorphic in \( \mathbb{D}^2 \) with \( g(0) = 0 \) and

\[ g(z_1, z_2) = h_1(z_1) + h_2(z_2) + z_1 z_2 (h_3(z_1) + h_4(z_2)) + z_1^2 z_2^2 h(z_1 z_2), \]

then

\[ \| K^{-1} h \|_{L^p(d\lambda)} \leq C \| K^{-1} g \|_{L^p(d\lambda)} \]

with \( C \) independent of \( g \).

Proof. Since \( h_1(z_1) = g(z_1, 0) \), thus

\[ \| K^{-1} h_1 \|_{L^p(d\lambda)} \leq \| K^{-1} g \|_{L^p(d\lambda)}. \]

Similarly, \( \| K^{-1} h_2 \|_{L^p(d\lambda)} \leq \| K^{-1} g \|_{L^p(d\lambda)}. \) Next write

\[ \tilde{g}(z_1, z_2) = \frac{g(z_1, z_2) - h_1(z_1) - h_2(z_2)}{z_1 z_2} = h_3(z_1) + h_4(z_2) + z_1 z_2 h(z_1 z_2). \]

Using Lemma 15 in [10] (or a similar version of it), we can get

\[ \| K^{-1} \tilde{g} \|_{L^p(d\lambda)} \leq C_1 \| K^{-1} g \|_{L^p(d\lambda)}. \]

Repeating the above process one more time, we get

\[ \| K^{-1} h \|_{L^p(d\lambda)} \leq C_2 \| K^{-1} g \|_{L^p(d\lambda)}. \]
