ON THE LINEAR INDEPENDENCE
OF CERTAIN COHOMOLOGY CLASSES
IN THE CLASSIFYING SPACE FOR SUBFOLIATIONS

DEMETRIO DOMÍNGUEZ

ABSTRACT. The purpose of this paper is to establish the linear independence of
certain cohomology classes in the Haefliger classifying space $B\Gamma(q_1, q_2)$ for sub-
foliations of codimension $(q_1, q_2)$. The classes considered are of secondary
type, not belonging to the sub algebra of $H(B\Gamma(q_1, q_2), \mathbb{R})$ generated by the
union of the universal characteristic classes for foliations of codimension $q_1$
and $q_2$ respectively, and are elements of the kernel of the canonical homomor-
phism $H(B\Gamma(q_1, q_2), \mathbb{R}) \rightarrow H(B\Gamma q_1 \times B\Gamma d, \mathbb{R})$ with $d = q_2 - q_1 > 0$.

1. INTRODUCTION

Let $M$ be an $n$-dimensional manifold and $TM$ its tangent bundle. A
$(q_1, q_2)$-codimensional subfoliation on $M$ is a couple $(F_1, F_2)$ of integrable
subbundles $F_i$ of $TM$ of dimension $n - q_i$, $i = 1, 2$, with $F_2$ being at the
same time a subbundle of $F_1$. Therefore, for each $i = 1, 2$, $F_i$ defines a $q_i$-
codimensional foliation on $M$, $d = q_2 - q_1 \geq 0$, and the leaves of $F_i$ contain
those of $F_2$. Moussu [18], Feigin [9], and Cordero-Masa [5] have studied the
(exotic) characteristic homomorphism of a subfoliation $(F_1, F_2)$, and Carballes
[3] has generalized Cordero-Masa’s construction, introducing the characteristic
homomorphism $\Delta_\ast(P): H(W(g, H)\mathbb{R}) \rightarrow H_{DR}(M)$ of an $(F_1, F_2)$-foliated
principal bundle $P = P_1 + P_2$ over $M$ of structure group $G = G_1 \times G_2$. The
author has computed in [6] the cohomology algebras $H(W(g, H)\mathbb{R})$ and has given
some geometric interpretations for the Godbillon-Vey classes of a subfoliation.
Finally, the author has evaluated in [7] the characteristic homomorphism of a
subfoliation for the particular case of locally homogeneous subfoliations, using
the techniques of Kamber-Tondeur [16] and Carballes [3], and has given several
examples of such subfoliations with nontrivial secondary or exotic characteris-
tic classes which do not belong to the subalgebra of $H_{DR}(M)$ generated by the
characteristic classes of the two foliations.

In this paper, using some of the results obtained in [6, 7], we prove the linear
independence of certain cohomology classes in the Haefliger classifying space
$B\Gamma(q_1, q_2)$ for subfoliations of codimension $(q_1, q_2) = (d + 1, 2d + 1)$ with $d \geq
1$. These classes are universal secondary characteristic classes for subfoliations
of codimension $(q_1, q_2)$, not belonging to the subalgebra of $H(B\Gamma(q_1, q_2), \mathbb{R})$
generated by the union of the universal characteristic classes for foliations of
codimension $q_1$ and $q_2$ respectively. Furthermore, the classes considered are in the kernel of the canonical homomorphism

$$H(B\Gamma_{(q_1, q_2)}, R) \to H(B\Gamma_{q_1} \times B\Gamma_d, R),$$

where $B\Gamma_{q_1}$ (resp. $B\Gamma_d$) is the Haefliger classifying space for foliations of codimension $q_1$ (resp. $d$). A similar result holds for cohomology classes in the Haefliger classifying space $B\Gamma^+_{(q_1, q_2)}$ (resp. $F\Gamma_{(q_1, q_2)}$) for subfoliations of codimension $(q_1, q_2)$ with oriented normal bundle (resp. with trivialized normal bundle).

The paper is structured as follows. In §2 we define the classifying space $B\Gamma_{(q_1, q_2)}$ for subfoliations of codimension $(q_1, q_2)$. In §3 we introduce the universal characteristic homomorphism $\Delta_*: H(WO_1) \to H(B\Gamma_{(q_1, q_2)}, R)$ for subfoliations of codimension $(q_1, q_2)$ using the techniques of Bott [2] and Cordero-Masa [5]. §4 is devoted to the computation of the canonical homomorphism $p_*: H(WO_1) \to H(WO_{q_1}) \otimes H(WO_d)$ using the author's techniques [6]. Finally, in §5 the results obtained in §§3, 4 and [7] are used in order to establish the results of the preceding paragraph.

Throughout this paper all manifolds, foliations, and subfoliations are of type $C^\infty$, and cohomology groups are taken with real coefficients. We also adopt the notations of [3, 6, 7, 16].

2. The Classifying Space for Subfoliations

In this section we define a classifying space for subfoliations. For this purpose, the techniques used by Haefliger in [12] will be adopted here.

Let $(q_1, q_2)$ be a couple of integers $q_i$ with $0 \leq q_1 \leq q_2$. Consider the subgroupoid $\Gamma = \Gamma_{(q_1, q_2)} \subset \Gamma_{q_2}$ of germs of local diffeomorphisms of $R^{q_2} = R^{q_1} \times R^d$ preserving the foliation on $R^{q_2}$ defined by the canonical projection into $R^{q_1}$, where $d = q_2 - q_1 \geq 0$. Let $G = GL(q_1, q_2) \subset GL(q_2)$ be the subgroup of matrices of the form

$$\begin{pmatrix} A & 0 \\ B & \end{pmatrix}$$

with $A \in GL(q_1)$ and $B \in GL(d)$. Clearly, $GL(q_1) \times GL(d) \subset G$ is a deformation retract. The differential defines a continuous homomorphism $\Gamma \to G$, and it induces a continuous map $\nu: B\Gamma \to BG$ classifying the normal bundle of the universal $\Gamma$-structure on the Haefliger classifying space $B\Gamma$ for $\Gamma$.

Now, let $(F_1, F_2)$ be a $(q_1, q_2)$-codimensional subfoliation on an $n$-dimensional manifold $M$. Then $(F_1, F_2)$ is given by an open cover of $M$ by coordinate charts $\{U_\alpha\}_{\alpha \in \Lambda}$ with local coordinate functions $x^a_1, \ldots, x^a_n$ satisfying

$$\frac{\partial x^\beta_1}{\partial x^a_1} = \frac{\partial x^\beta_2}{\partial x^a_2} = \frac{\partial x^\beta_a}{\partial x^a_\alpha} = 0 \text{ on } U_\alpha \cap U_\beta \text{ for } 1 \leq i \leq q_1 < a \leq q_2 < u \leq n.$$

It follows that there is an open cover $\{U_\alpha\}_{\alpha \in \Lambda}$ of $M$ and submersions $f_\alpha: U_\alpha \to R^{q_2} = R^{q_1} \times R^d$ such that

$$(F_1|_{U_\alpha}, F_2|_{U_\alpha}) = (f_\alpha^{-1}(0 \times TR^d), f_\alpha^{-1}(0)) \text{ for } \alpha \in \Lambda.$$ 

Hence, using the techniques of Haefliger [12], we obtain the following result.
Proposition 2.1. A \((q_1, q_2)\)-codimensional subfoliation \((F_1, F_2)\) on \(M\) is classified (up to homotopy) by a continuous map \(f: M \to B\Gamma\), and its normal bundle 
\[\nu(F_1, F_2) = \nu F_1 \oplus (F_1/F_2)\] is classified by the composition

\[
M \xrightarrow{f} B\Gamma \xrightarrow{\nu} BG \cong B(GL(q_1) \times GL(d)) \\
\cong BGL(q_1) \times BGL(d) \cong BO(q_1) \times BO(d).
\]

Remarks. (1) It is clear that \(F_i\) is classified by the map \(f_i = \phi_i \circ f: M \to B\Gamma_{q_i}\), \(i = 1, 2\), where \(\phi_i\) is the canonical map. Of course, the map \(\nu \circ f: M \to B\Gamma \to BG\) classifies the vector bundle \(\nu F_2 \cong \nu (F_1, F_2)\) with structure group \(G = GL(q_1, q_2)\).

(2) Similarly, a double foliation on \(M\) given by two transverse foliations \(F_1\) and \(F_0\) of codimension \(q_1\) and \(d\) respectively is classified (up to homotopy) by a continuous map 
\[
f: M \to B(\Gamma_{q_1} \times \Gamma_d) \approx B\Gamma_{q_1} \times B\Gamma_d.
\]

The \((q_1, q_2)\)-codimensional subfoliation \((F_1, F_2) = (F_1, F_1 \cap F_0)\) on \(M\) is classified by the map \(\phi \circ f: M \to B(\Gamma_{q_1} \times \Gamma_d) \to B\Gamma\), and \(F_1\) (resp. \(F_0\)) is classified by the map \(\phi_1 \circ f: M \to B(\Gamma_{q_1} \times \Gamma_d) \to B\Gamma_{q_1}\) (resp. by the map \(\phi_0 \circ f: M \to B(\Gamma_{q_1} \times \Gamma_d) \to B\Gamma_d\)), where \(\phi, \phi_1,\) and \(\phi_0\) denote the canonical maps.

(3) In the same way, a \((q_1, q_2)\)-codimensional subfoliation \((F_1, F_2)\) with trivialized normal bundle on \(M\) (in the sense of Cordero-Masa [5]) is classified (up to homotopy) by a continuous map \(f: M \to F\Gamma\), where \(F\Gamma\) denotes the homotopy theoretic fiber of the map \(\nu: B\Gamma \to BG\). Analogously, a \((q_1, q_2)\)-codimensional subfoliation \((F_1, F_2)\) with oriented normal bundle on \(M\) (in the sense of [6]) is classified (up to homotopy) by a continuous map \(f: M \to B\Gamma^+\), where \(\Gamma^+ = \Gamma^+_{(q_1, q_2)} \subset \Gamma\) is the subgroupoid of all \(\gamma \in \Gamma\) such that the differential of \(\gamma\) belongs to the connected component \(G_0\) of the group \(G\).

3. Characteristic classes of subfoliations

In this section the universal characteristic classes for subfoliations are discussed.

Let 
\[\nu^*: H(BO(q_1), R) \otimes H(BO(d), R) \cong H(BG, R) \to H(B\Gamma, R)\]
be the homomorphism induced by the map \(B\Gamma \xrightarrow{\nu} BG \cong BO(q_1) \times BO(d)\) in cohomology. Then, using the techniques of Bott [2], from Theorem 3.9 in [5] we obtain Bott's obstruction theorem for subfoliations (actually, for \(\Gamma\)-structures):

Theorem 3.1. \(\nu^*(H^j(BO(q_1), R) \otimes H^j(BO(d), R)) = 0\) if at least one of the inequalities \(i > 2q_1, i + j > 2q_2\) is satisfied.

Similarly, since the characteristic homomorphism for subfoliations is natural with respect to subfoliation preserving maps, we have the following

Theorem 3.2. There exists a unique homomorphism

\[\Delta_*: H(WO_I) \cong H(W(gl(q_1) \oplus gl(d), O(q_1) \times O(d))_I) \to H(B\Gamma, R)\]
such that \(\Delta_*(F_1, F_2) = f^* \circ \Delta_*: H(WO_I) \to H(B\Gamma, R) \to H(M, R) \cong H_{DR}(M)\) for any \((q_1, q_2)\)-codimensional subfoliation \((F_1, F_2)\) on a manifold \(M\) with classifying map \(f: M \to B\Gamma\), where \(\Delta_*(F_1, F_2)\) denotes the characteristic homomorphism of \((F_1, F_2)\) as defined in [5].
**Definition 3.3.** $\Delta_*$ is called the universal characteristic homomorphism for subfoliations of codimension $(q_1, q_2)$ and the elements of $\text{Im} \Delta_* \subset H(B\Gamma, R)$ are called the universal characteristic classes for subfoliations of codimension $(q_1, q_2)$.

Our purpose is to obtain information about $\text{Im} \Delta_* \subset H(B\Gamma, R)$. In the computation of the homomorphism $\Delta_*$, the following result is interesting.

**Proposition 3.4.** The diagram

$$
\begin{array}{cccc}
H(WO_{q_1}) & \xrightarrow{\tilde{W}(d\rho_1)^*} & H(WO_{q_1}) \otimes H(WO_d) & \xrightarrow{p_*} H(WO_{q_2}) \\
\downarrow \Delta_1^* & & \downarrow \tilde{\Delta}_1^* & \downarrow \Delta_2^* \\
H(B\Gamma_{q_1}, R) & \xrightarrow{\phi_1^*} & H(B\Gamma_{q_1} \times B\Gamma_d, R) & \xrightarrow{\phi^*} H(\Gamma, R) \\
\end{array}
$$

is commutative, where the vertical maps are the universal characteristic homomorphisms (with $\tilde{\Delta}_i^*$ the universal characteristic homomorphism for double foliations of codimension $q_1$ and $d$ respectively), and the horizontal maps are the canonical homomorphisms.

**Proof.** This follows from Theorem 5.2 in [5] and Theorem 4.6 in [6].

**Remarks.**

1. It is clear that the canonical homomorphisms $\phi_1^*, \phi_1^*, W(d\rho_1)^*$, and $\tilde{W}(d\rho_1)^*$ are injective, and that $\text{Im} \phi_i^* \Delta_i^* \subset \text{Im} \Delta_*$, $i = 1, 2$.

2. For $q_1 = q_2 = q$, and for $q_1 = 0$ and $q_2 = q$, the results obtained above are reduced to the ordinary case of foliations of codimension $q$. On the other hand, $B\Gamma$ can also be considered as the classifying space for foliated manifolds $(M, F)$ with $F$ of codimension $q_1$ and $M$ of dimension $q_2$.

3. The universal characteristic homomorphism

$$
\tilde{\Delta}_*: H(W_{\Gamma}) \cong H(W(\mathfrak{gl}(q_1) \oplus \mathfrak{gl}(d), SO(q_1) \times SO(d))) \rightarrow H(F\Gamma, R)
$$

(resp. $\Delta'_*: H(W(\mathfrak{gl}(q_1) \oplus \mathfrak{gl}(d), SO(q_1) \times SO(d))) \rightarrow H(B\Gamma^+, R)$) for subfoliations of codimension $(q_1, q_2)$ with trivialized normal bundle (resp. with oriented normal bundle) is constructed in an analogous way and results similar to those announced in Proposition 3.4 are obtained. Moreover, there is a commutative diagram

$$
\begin{array}{cccc}
H(WO_{q_1}) & \xrightarrow{\Delta_*} & H(W(\mathfrak{gl}(q_1) \oplus \mathfrak{gl}(d), SO(q_1) \times SO(d))) & \xrightarrow{\tilde{\Delta}_*} H(WI) \\
\downarrow \Delta_1^* & & \downarrow \Delta_1^* & \downarrow \tilde{\Delta}_* \\
H(B\Gamma, R) & \xrightarrow{\phi_1^*} & H(B\Gamma_{q_1} \times B\Gamma_d, R) & \xrightarrow{\phi^*} H(\Gamma, R) \\
\end{array}
$$

with canonical horizontal maps.

4. The Computation of the Homomorphism $p_*$

In this section, using the notations of §3 in [6], we give the computation of the canonical homomorphism $p_*: H(WO_{q_1}) \rightarrow H(WO_{q_1}) \otimes H(WO_d)$ with $0 < q_1 < q_2$ and $d = q_2 - q_1 > 0$. 
Proposition 4.1. The cohomology classes in $H(W_{01})$ of the cocycles

$$z(i', i, j', j) = y(i) \wedge y'(i') \otimes c(j) c'(j')$$

$$= y_{i_1} \wedge \cdots \wedge y_{i_t} \wedge y_{i_1}' \wedge \cdots \wedge y_{i_t}'$$

$$\otimes c_1^{i_1} \cdots c_t^{i_1} c_1^{i_1'} \cdots c_t^{i_t'} \in W_{01}$$

of the Vey basis (with $2p_1 = \deg c(j)$, $2p_2 = \deg c'(j')$, and $p = p_1 + p_2$) satisfying the conditions:

1. $0 \leq p_1 \leq q_1$, $0 \leq p_2 \leq d$, $0 \leq s \leq [(q_1 + 1)/2]$, and $0 \leq s' \leq [(d + 1)/2]$;
2. $i_0 + p_1 \geq q_1 + 1$ and $i_0' + p \geq q_2 + 1$;
3. $i_0 \leq j_0'$ and $i_0' \leq j_0$.

are mapped under the homomorphism $p_* : H(W_{01}) \to H(W_{0q_1}) \otimes H(W_{0d})$ onto a basis of $\text{Im} p_* \subset H(W_{0q_1}) \otimes H(W_{0d})$.

Proof. Let $C$ be the set of elements $z(i', i, j', j)$ such that $0 \leq p_1 \leq q_1$, $0 \leq p_2 \leq q_2$, $0 \leq s \leq [(q_1 + 1)/2]$, and $0 \leq s' \leq [(d + 1)/2]$. Let $C_a$, $C_b$, and $C_c$ be the sets of elements $z(i', i, j', j) \in C$ satisfying the conditions:

- $(C_a)$ $i_0 > i_0'$, $i_0' < j_0$, $i_0' \leq j_0' - 1$, and $i_0 + p \geq q_2 + 1$;
- $(C_b)$ $i_0 \leq i_0'$, $i_0 \leq j_0$, $i_0 \leq j_0'$, $i_0 + p_1 < q_1 + 1$, and $i_0 + p \geq q_2 + 1$;
- $(C_c)$ $i_0 \leq i_0'$, $i_0 \leq j_0$, $i_0 \leq j_0'$, $i_0 + p_1 \geq q_1 + 1$, and $i_0' + p \geq q_2 + 1$.

respectively. In particular, we have $C_a \cap C_b = C_a \cap C_c = C_b \cap C_c = \emptyset$. It is clear that the elements $z(i', i, j', j) \in C_a \cup C_b \cup C_c$ are cocycles and that the Vey basis of $H(W_{01})$ is given by the cohomology classes of these cocycles.

Clearly, we have $p_*[z(i', i, j', j)] = 0$ for $z(i', i, j', j) \in C_a \cup C_b \cup C_c$ such that $d < p_2 \leq q_2$. It follows that $p_*[z(i', i, j', j)] = 0$ for $z(i', i, j', j) \in C_b$. On the other hand, consider the subspace $\tilde{C}_a$ (resp. $\tilde{C}_c$) of $H(W_{01})$ spanned by the classes of the cocycles $z(i', i, j', j) \in C_a$ such that $0 \leq p_2 \leq d$ and $i_0 \leq j_0$ (resp. of the cocycles $z(i', i, j', j) \in C_c$ such that $0 \leq p_2 \leq d$). Then it is easy to see that the $R$-linear map

$$p_*|_{\tilde{C}} : \tilde{C} \to H(W_{0q_1}) \otimes H(W_{0d})$$

is injective, where $\tilde{C} = \tilde{C}_a + \tilde{C}_c$.

Finally, for $z(i', i, j', j) \in C_a$ with $0 \leq p_2 \leq d$ and $j_0 < i_0$, we obtain

$$p_*[z(i', i, j', j)] = [y(i) \otimes c(j)] \otimes [y'(i') \otimes c'(j')]$$

$$= \sum_{t=1}^{s} (-1)^{t+1} p_*[y_{j_0} \wedge y_{i_1} \wedge \cdots \wedge y_{i_1} \wedge y_{i_1}' \otimes c_i \cdot \Phi \cdot c'(j')]$$

where $\Phi = c_1^{i_1} \cdots c_t^{i_1} c_0^{i_0-1} \cdots c_t^{i_t}$ (with $p_*[z(i', i, j', j)] = 0$ for $s = 0$); it follows that $p_*[z(i', i, j', j)] \in \text{Ker} p_* \subset H(W_{0q_1})$. Whence $\text{Im} p_* = p_* \tilde{C}$. □

In a similar way, we obtain the following

Proposition 4.2. An $R$-basis of $\text{Ker} p_*$ in $H(W_{01})$ is given by the union of the classes $[z(i', i, j', j)]$ of the Vey basis of $H(W_{01})$ such that $d < p_2 \leq q_2$ and the classes of the cocycles

$$z'(i', i, j', j) = z(i', i, j, j') - \sum_{t=1}^{s} (-1)^{t+1} y_{j_0} \wedge y_{i_1} \wedge \cdots \wedge \hat{y}_{i_t}$$

$$\wedge \cdots \wedge y_{i_t} \wedge y_{i_1}' \otimes c_i \cdot \Phi \cdot c'(j')$$
such that $0 \leq p_1 \leq q_1$, $0 \leq p_2 \leq d$, $0 \leq s \leq [(q_1 + 1)/2]$, $0 \leq s' \leq [(d + 1)/2]$, $i_0 > j_0 > i_0'$, $i_0 \leq j_0'$, and $i_0' + p \geq q_2 + 1$, where $\Phi = c_1^{j_0} \cdots c_1^{j_{i_0} - 1} \cdots c_1^{j_{i_0} + 1}$ (with $z(i', i, j, j') = z(i', i, j, j')$ for $s = 0$).

Let $\tilde{C} \subset H(W_{O_{q_1}})$ be the subspace spanned by the cohomology classes of the cocycles $z(i, i', j, j')$ considered in Proposition 4.1. Let $\tilde{C}' \subset \tilde{C}$ be a subspace with $\tilde{C}' \neq 0$, such that $(p_1|z)|^{-1} \left( \text{Ker } \Delta_1 \right) \cap \tilde{C}' = 0$ (evidently, the results of Kamber-Tondeur [17] imply that there is a subspace $\tilde{C}' \subset \tilde{C}$ of dimension $2[(q_1 + 1)/2] - 1(2[(d + 1)/2] - 1 + 1)$ satisfying the property above), where $\Delta_1' = \mu \circ (\Delta_1 \otimes \Delta_0_*) : H(W_{O_{q_1}}) \otimes H(W_{O_{d}}) \to H(B_{q_1} \times B_{d}, R)$ denotes the universal characteristic homomorphism for double foliations of codimension $q_1$ and $d$ respectively, $\Delta_1$ (resp. $\Delta_0$) being the universal characteristic homomorphism for foliations of codimension $q_1$ (resp. $d$), and $\mu$ the cohomology cross product (clearly, the homomorphism $\mu$ is injective). Then, from Propositions 3.4, 4.1, and 4.2 we obtain the following result.

**Corollary 4.3.** (i) The $R$-linear maps

$$\Delta|_{\tilde{C}'} : \tilde{C}' \to H(B_{\Gamma}, R)$$

and $\phi^*: \Delta|_{\tilde{C}'} : \tilde{C}' \to H(B_{\Gamma_{q_1}} \times B_{\Gamma_{d}}, R)$

are injective.

(ii) We have

$$\Delta_{\star} \text{ Ker } p_\star \subset \text{ Ker } \phi^* \subset H(B_{\Gamma}, R),$$

$$\text{Im } \Delta_{\star} = \Delta_{\star} \tilde{C} + \Delta_{\star} \text{ Ker } p_\star \subset \Delta_{\star} \tilde{C} + \text{ Ker } \phi^* \subset H(B_{\Gamma}, R),$$

$$\Delta_{\star} \tilde{C} \cap \text{ Ker } \phi^* = \Delta_{\star} ((p_1|z)|^{-1} \left( \text{Ker } \Delta_1' \right)),$$

$$\Delta_{\star}^{-1} (\text{Ker } \phi^*) = (p_1|z)|^{-1} \left( \text{Ker } \Delta_1' \right) \oplus \text{ Ker } p_\star \subset \tilde{C} \oplus \text{ Ker } p_\star = H(W_{O_{q_1}}),$$

$$\text{Im } \phi_1^* \Delta_{\star} \subset \Delta_{\star} \tilde{C}, \quad \text{and } \text{Im } \phi_1^* \Delta_{\star} \subset \text{ Ker } \phi^* = 0.$$
Results similar to those announced above are obtained. It is clear that the homomorphism $p'_\ast$ is given by $p'_\ast|_{H(W_{O}\oplus)} = p_\ast$, $p'_\ast e_m = e_m$, and $p'_\ast e'_n = e'_n$, where $e_m \in I^{2m}(SO(q_1))$ (resp. $e'_n \in I^{2n}(SO(d))$) denotes the Pfaffian polynomial for $q_1 = 2m$ (resp. for $d = 2n$).

5. EXAMPLES AND APPLICATIONS

In this section, using the examples of locally homogeneous subfoliations (with nontrivial characteristic classes) given in [7], we show that $\Delta_\ast \ker p_\ast \subset H(B\Gamma, R)$ is nontrivial for $(q_1, q_2) = (d + 1, 2d + 1)$ with $d \geq 1$.

Let $H \subset G_2 \subset G_1 \subset \widehat{G}$ be Lie groups, and $h \subset g_2 \subset g_1 \subset \widehat{g}$ their Lie algebras. Assume that $H$ is closed in $\widehat{G}$. Let $\overline{\Gamma} \subset \widehat{G}$ be a discrete subgroup acting properly discontinuously and without fixed points on $\overline{G}/H$, so that $M = \overline{G}/\overline{G}/H$ is a manifold. A $(q_1, q_2)$-codimensional subfoliation $(F_1, F_2)$ on $M$ of the form $(F_1, F_2) = (F_{G_1}, F_{G_2})$ is called a locally homogeneous subfoliation, where $F_i = F_{G_i}$ is the locally homogeneous foliation of codimension $q_i = \dim \overline{g}/g_i$ on $M$, induced by the foliation on $\overline{G}$ defined by the right action of $G_i$, $i = 1, 2$. The computation of the characteristic homomorphism for locally homogeneous subfoliations has been described in [7].

Clearly, if $G_1$ and $G_2$ are connected or if $H$ is connected, then $(F_1, F_2) = (F_{G_1}, F_{G_2})$ is a subfoliation with oriented normal bundle. Similarly, for $H = \{e\}$, $(F_1, F_2) = (F_{G_1}, F_{G_2})$ is a subfoliation with trivialized normal bundle.

Example 1. Let $\widehat{G} = SL(d + 2)$, $G_1 = SL(d + 2, 1)_0$, $G_2 = SL(d + 2, 2)_0$, $H = SO(d)$, and $\overline{T} \subset SL(d+2)$ be a discrete uniform and torsion-free subgroup (with $d \geq 1$), where $SL(d+2, 1)_0$ (resp. $SL(d+2, 2)_0$) denotes the connected component of the group $SL(d+2, 1)$ (resp. of the group $SL(d+2, 2)$) of unimodular matrices of the form

$$
\begin{pmatrix}
\lambda & * \\
0 & A
\end{pmatrix}
$$

with $A \in GL(d+1)$ and $\lambda^{-1} = \det A$ (resp. of the form

$$
\begin{pmatrix}
\lambda_1 & * \\
\lambda_2 & * \\
0 & 0 & B
\end{pmatrix}
$$

with $B \in GL(d)$, $\lambda_1, \lambda_2 \in GL(1)$, and $\lambda_1^{-1} = \lambda_2 \cdot \det B$). Then, by virtue of Theorem 3.2 in [7], $M = \overline{G}/H$ is a connected compact orientable manifold and the canonical homomorphism $\gamma_\ast : H(\widehat{g}, H) \to H_{DR}(M)$ is injective. Furthermore, we have

$$
H(\overline{g}, H) \cong \begin{cases}
\wedge (\overline{\gamma}_3, \overline{\gamma}_5, \ldots, \overline{\gamma}_{2n-1}, \overline{\gamma}_{d+1}, \overline{\gamma}_{d+2}) & \text{for } d = 2n - 1,
\wedge (\overline{\gamma}_3, \overline{\gamma}_5, \ldots, \overline{\gamma}_{2n-1}, \overline{\gamma}_{d+1}, \overline{\gamma}_{d+2}) \otimes R[e'_n]/(e'_n^2) & \text{for } d = 2n,
\end{cases}
$$

where the elements $\overline{\gamma}_j$ are the relative suspensions of the Chern polynomials $\overline{c}_j \in I(SL(d+2)) = R[\overline{c}_2, \overline{c}_3, \ldots, \overline{c}_{d+2}]$ and $e'_n \in I^{2n}(SO(2n))$ is the Pfaffian polynomial.

On the other hand, consider the locally homogeneous subfoliation $(F_1, F_2) = (F_{G_1}, F_{G_2})$ of codimension $(q_1, q_2) = (d + 1, 2d + 1)$ with oriented normal bundle on $M$. Let

$$
\Delta_\ast(F_1, F_2) : H(W(\gl(d+1) \oplus \gl(d), SO(d+1) \times SO(d))_1) \to H_{DR}(M)
$$
be the characteristic homomorphism of this subfoliation. Let $c(j) = c_{j1} \cdots c_{jd+1}$ be a monomial of $\deg c(j) = 2(d + 1 - k)$ and $c'(j') = c_{j'1} \cdots c_{jd}'$ a monomial of $\deg c'(j') = 2(d + k)$ with $0 \leq k \leq d + 1$. Choose integers $t_0, t_1, \ldots, t_{n-1}$ such that $0 \leq t_s \leq s$ for $s = 0, 1, \ldots, n-1$, where $n = [(d + 1)/2]$. Now, consider in $H(W(gl(d + 1) \oplus gl(d), SO(d + 1) \times SO(d))_f)$ the classes of the cocycles

$$z(i, j, j') = y_1 \wedge y_{2i_1} \wedge \cdots \wedge y_{2i_n} \wedge y_i' \wedge y_{2i_n+1}' \wedge \cdots \wedge y_{2i_n}' \otimes c(j)c'(j')$$

for $2 \leq i_1 < \cdots < i_t < t_{t+1} < \cdots < i_s \leq n$, $0 \leq s \leq n - 1$, where $z(i, j, j') = y_1 \wedge y_i' \otimes c(j)c'(j')$ for $s = 0$, $z(i, j, j') = y_1 \wedge y_{2i_1} \wedge \cdots \wedge y_{2i_n-1} \wedge y_i' \otimes c(j)c'(j')$ for $s > 0$ and $t_s = s$, and $z(i, j, j') = y_1 \wedge y_i' \wedge y_{2i_n-1}' \wedge \cdots \wedge y_{2i_n-1}' \otimes c(j)c'(j')$ for $s > 0$ and $t_s = 0$. It is clear that the classes $[z(i, j, j') \otimes \Phi]$ belong to the kernel of the canonical homomorphism

$$p'_*: H(W(gl(q_1) \oplus gl(d), SO(q_1) \times SO(d))_f) \rightarrow H(W(gl(q_1), SO(q_1))_q) \otimes H(W(gl(d), SO(d))_d)$$

for $1 \leq k \leq d + 1$, where $\Phi = 1$ if $d = 2n - 1$, and $\Phi = 1$ or $e_n'$ if $d = 2n$. We have then the following result.

**Theorem 5.1.** For $k = 0$ and $1 < k \leq d + 1$, we have the linearly independent secondary classes

$$\Delta_*([F_1, F_2])z(i, j, j') \otimes \Phi = \mu \cdot \gamma_*(\nabla_{2i_1} \wedge \cdots \wedge \nabla_{2i_n} \wedge \nabla_{d+1} \wedge \nabla_{d+2} \otimes \Phi)$$

with $2 \leq i_1 < \cdots < i_t < t_{t+1} < \cdots < i_s \leq n$, $0 \leq s \leq n - 1$, $\Phi = 1$ if $d = 2n - 1$, $\Phi = 1$ or $e_n'$ if $d = 2n$, and

$$\mu = (-1)^h (d + 2)(d + 1)(a_{kk-1} - a_{kk}) \prod_{i=1}^{d+1} \left( \frac{d + 2}{i} \right)^{j_i} \cdot \prod_{i=1}^{d} \left( \frac{d + 1}{i} \right)^{j_i'} \neq 0,$$

where $a_{kk-1}, a_{kk} \in R$ (with $a_{kk-1} = 0$ for $k = 0$) are given by the polynomial

$$f_k(\lambda) = \prod_{i=1}^{d+k} \left( \sum_{u=0}^{i} \left( \binom{i}{u} \left( \frac{d + 1}{u} \right) \lambda^u \right) j_i \right)

= \sum_{v=0}^{d+k} a_{kv} \lambda^v \in R[\lambda], \quad a_{kv} \in R.$$

The corresponding classes then span the subspace

$$\gamma_*(\text{Ideal}((\nabla_{d+2} \wedge \nabla_{d+1})) \quad \text{for } d = 2n - 1,

= \left\{ \gamma_*(((\nabla_{d+2} \wedge \nabla_{d+1}) \cdot (\nabla_3, \nabla_5, \ldots, \nabla_{2n-1})) \quad \text{for } d = 2n

\gamma_*(((\nabla_{d+2} \wedge \nabla_{d+1}) \cdot (\nabla_3, \nabla_5, \ldots, \nabla_{2n-1}) \otimes R[e_n']/(e_n'^2)) \quad \text{for } d = 2n

of } H_{DR}(M) \text{ of dimension } 2^{[d/2]} \right\}.$$

For $k = 1$, we have $\Delta_*([F_1, F_2])z(i, j, j') \otimes \Phi = 0$.

**Proof.** It suffices to proceed as in the proof of Theorem 6.1 in [7]. It is easy to see that $a_{kk} = 1$ for $k = 0$. Thus we have only to show that $a_{kk-1} - a_{kk} \neq 0$ for $1 < k \leq d + 1$, and $a_{kk-1} - a_{kk} = 0$ for $k = 1$.

Now, using the $v$th derivative of $f_k(\lambda)$, $v = 0, 1, \ldots, d + k$, by a direct computation of $a_{kv} > 0$ for $0 \leq v \leq d + k$, $1 \leq k \leq d + 1$, we then obtain

$$a_{kv} < ((vd + k)/(vd + v))a_{k-1} \quad \text{for } 1 < v \leq d + k, \quad 1 \leq k \leq d + 1.$$
It follows that \( a_k < a_{k+1} \) for \( \max(2, k) \leq v \leq d + k, 1 \leq k \leq d + 1 \). Hence
\[
a_{k+1} - a_k > 0 \quad \text{for } 1 < k \leq d + 1.
\]

On the other hand, since \( a_0 = 1 \) and \( a_1 = (d + k)/(d + 1) \) for \( 1 \leq k \leq d + 1 \), we have \( a_0 - a_1 = 0 \) for \( k = 1 \). It follows that
\[
\Delta_*[z(i,j,j')] \otimes \Phi = 0 \quad \text{for } k = 1. \quad \Box
\]

Remark. It is clear that
\[
a_{k+1} - a_k = (k - 1) \frac{d + k}{d} \quad \text{for } c(j') = c_{d+k}, \quad 0 \leq k \leq d + 1.
\]

Theorem 4.6 in [6] and Theorem 5.1 imply the following

Corollary 5.2. The subfoliation considered in Theorem 5.1 is not integrably homotopic to a subfoliation of codimension \((d + 1, 2d + 1)\) on \( M \) of the form \((F'_1, F'_1 \cap F'_0)\) with \( F'_0 \) a \( d \)-codimensional foliation on \( M \).

Let \((q_1, q_2) = (d + 1, 2d + 1)\) with \( d \geq 1 \). Consider the universal characteristic homomorphism
\[
\Delta'_*: H(W(gl(q_1) \oplus gl(d), SO(q_1) \times SO(q_2))) \to H(B\Gamma^+, R)
\]
(resp. \( \Delta'_{ij}*: H(W(gl(q_1), SO(q_1))) \to H(B\Gamma^+_{q_i}, R) \)) for subfoliations of codimension \((q_1, q_2)\) (resp. for foliations of codimension \( q_i, i = 1, 2 \)) with oriented normal bundle, and the canonical homomorphisms \( \phi^{i*}: H(B\Gamma^+, R) \to H(B\Gamma^+_{q_i} \times B\Gamma^+_d, R) \) and \( \phi^{i*}_{ij}: H(B\Gamma^+_{q_i}, R) \to H(B\Gamma^+, R), i = 1, 2 \). Then, by Theorem 6.1 in [7], Theorem 5.1, Propositions 3.4 and 4.2, and Corollary 4.3 (in the oriented case) we obtain the following result.

Theorem 5.3. Let \( z(i,j,j') \) be cocycles as in Theorem 5.1 with \( 1 < k \leq d + 1 \). Then the universal secondary characteristic classes
\[
\Delta'[z(i,j,j')] \otimes \Phi \in \Delta'_* \text{ Ker } \phi^{i*}_* \subset \text{ Ker } \phi^{i*} \subset H(B\Gamma^+, R)
\]
for all \( 2 \leq i_1 < \cdots < i_t < i_{t+1} < \cdots < i_s \leq n, 0 \leq s \leq n - 1, \Phi = 1 \) if \( d = 2n - 1 \) and \( \Phi = 1 \) or \( e_n^* \) if \( d = 2n \), are linearly independent. The corresponding classes then span a subspace \( E \subset \Delta'_* \text{ Ker } \phi^{i*}_* \) of dimension \( 2^{\lfloor d/2 \rfloor} \) satisfying \( E \cap \text{ Im } \phi^{i*}_{1*} \Delta'_{i*} = 0, \quad i = 1, 2 \).

Corollary 5.4. \( \text{ Ker } \phi^{i*} \neq 0 \). Therefore, the canonical homomorphism \( \phi^{i*}_1 \) is not surjective.

Let \( A \subset H(B\Gamma^+, R) \) be the subalgebra generated by all elements of \( \text{ Im } \phi^{i*}_{1*} \Delta'_{i*} \cup \text{ Im } \phi^{i*}_{2*} \Delta'_{2*} \). Consider the subspace \( E' \subset E \) of dimension \( 2^{n-1} \) spanned by the universal secondary characteristic classes \( \Delta'[z(i,j,j')] \otimes \Phi \) given in Theorem 5.3 with \( \Phi = 1 \) for \( d = 2n - 1 \) and \( \Phi = e_n^* \) for \( d = 2n \). Then we have the following corollary.

Corollary 5.5. \( E' \cap A = 0 \).

Similarly, applying Theorem 6.1 in [7], Theorem 5.1, Propositions 3.4 and 4.2, and Corollary 4.3, we obtain the following
Corollary 5.6. There is a subspace $\tilde{N} \subset \text{Im} \Delta_*$ of dimension $2^{d/2}$, spanned by universal secondary characteristic classes, such that $\tilde{N} \cap A = 0$ and $\tilde{N} \cap \text{Ker} \phi^* = 0$.

Example 2. Let $G = \text{SL}(d + 2)$, $G_1 = \text{SL}(d + 2, 1)$, $G_2 = \text{SL}(d + 2, 2)$, $H = \text{O}(d)$, and $\overline{\Gamma} \subset \text{SL}(d + 2)$ be as in Example 1 (with $d \geq 1$). Consider the locally homogeneous subfoliation $(F_1, F_2) = (F_{G_1}, F_{G_2})$ of codimension $(q_1, q_2) = (d + 1, 2d + 1)$ on $M = \overline{\Gamma} \overline{G}/H$ (whose normal bundle is not necessarily orientable). Then, by Theorem 6.2 in [7], Theorems 5.1 and 5.3, Propositions 3.4 and 4.2, and Corollary 4.3 we obtain the following result.

Theorem 5.7. Let $(q_1, q_2) = (d + 1, 2d + 1)$ with $d \geq 1$. Let $z(i, j, j')$ be cocycles as in Theorem 5.3. Then the universal secondary characteristic classes $\Delta_*[z(i, j, j')] \in \Delta_*, \text{Ker} \phi_* \subset H(B\Gamma, R)$ for all $2 \leq i_1 < \cdots < i_t < i_{t+1} < \cdots < i_s \leq n = [(d + 1)/2]$, $0 \leq s \leq n - 1$, are linearly independent. The corresponding classes then span a subspace $E \subset \Delta_*, \text{Ker} \phi_* \subset H(B\Gamma, R)$ of dimension $2^{n-1}$ satisfying $E \cap \text{Im} \phi_* \Delta_* = 0$, $i = 1, 2$.

Corollary 5.8. $\text{Ker} \phi^* \neq 0$. It follows that the canonical homomorphism $\phi_*^*: H(B\Gamma_{q_1}, R) \to H(B\Gamma, R)$ is not surjective.

Example 3. Let $G$, $G_1$, and $G_2$ be as in Example 2, $H = \{e\}$, and $\overline{\Gamma} \subset \text{SL}(d + 2)$ a discrete uniform subgroup (with $d \geq 1$). Consider the locally homogeneous subfoliation $(F_1, F_2) = (F_{G_1}, F_{G_2})$ of codimension $(q_1, q_2) = (d + 1, 2d + 1)$ with trivialized normal bundle on $M = \overline{\Gamma} \overline{G}/H$. Now, let $c(j)$ and $c'(j')$ be as in Theorem 5.1 with $1 < k \leq d + 1$. Let $t_0, t_1, \ldots, t_{d-1}$ be integers such that $0 \leq t_s \leq s$ for $s = 0, 1, \ldots, d - 1$. Consider in $H(W_i)$ the cohomology classes of the cocycles

$$z(i, j, j') = y_1 \wedge y_{i_1} \wedge \cdots \wedge y_{i_t} \wedge y'_{i_{t+1}} \wedge \cdots \wedge y'_{i_{s}} \otimes c(j)c'(j')$$

with $2 \leq i_1 < \cdots < i_t < i_{t+1} < \cdots < i_s \leq d$, $0 \leq s \leq d - 1$, where $z(i, j, j') = y_1 \wedge y'_{i_1} \otimes c(j)c'(j')$ for $s = 0$, $z(i, j, j') = y_1 \wedge y_{i_1} \wedge \cdots \wedge y_{i_t} \wedge y'_{i_{t+1}} \wedge \cdots \wedge y'_{i_{s}} \otimes c(j)c'(j')$ for $s > 0$ and $t_s = s$, and $z(i, j, j') = y_1 \wedge y'_{i_1} \wedge y'_{i_{t+1}} \wedge \cdots \wedge y'_{i_{s}} \otimes c(j)c'(j')$ for $s > 0$ and $t_s = 0$. Then, by a technique analogous to that used in the proof of Theorems 5.1 and 5.3 but from more elementary computations we obtain

Theorem 5.9. Let $(q_1, q_2) = (d + 1, 2d + 1)$ with $d \geq 1$. Then the universal secondary characteristic classes $\tilde{\Delta_*}[z(i, j, j')] \in \tilde{\Delta_*}, \text{Ker} \tilde{\phi}_* \subset H(F\Gamma, R)$ for all $2 \leq i_1 < \cdots < i_t < i_{t+1} < \cdots < i_s \leq d$, $0 \leq s \leq d - 1$, are linearly independent. The corresponding classes then span a subspace $E \subset \tilde{\Delta_*}, \text{Ker} \tilde{\phi}_* \subset H(F\Gamma, R)$ of dimension $2^{d-1}$ satisfying $E \cap \text{Im} \tilde{\phi}_* \tilde{\Delta} = 0$, $i = 1, 2$. 

Corollary 5.10. For \((q_1, q_2) = (d + 1, 2d + 1)\) with \(d \geq 1\), the canonical homomorphism \(\tilde{\phi}^*: H(\Gamma, R) \to H(F \Gamma_{q_1} \times F \Gamma_2, R)\) is not injective. Hence, the canonical homomorphism \(\phi_1^*: H(F \Gamma_{q_1}, R) \to H(\Gamma, R)\) is not surjective.

Remark. Let \((q_1, q_2)\) be a couple of integers with \(0 < q_1 < q_2\). It follows from [11, 14, 15] that the canonical homomorphisms \(\phi_*, \phi_1^*, \phi_2^*, \phi_2^*\) and \(\tilde{\phi}_2^*\) are not surjective.

Proposition 5.11. Let \((q_1, q_2)\) be a couple of integers with \(0 < q_1 < q_2\), \((q_1, q_2) \neq (2m - 1, 2m)\), and \((q_1, q_2) \neq (1, 2m)\). Then the canonical homomorphism \(\phi_2^* : H(B \Gamma_{q_2}, R) \to H(\Gamma, R)\) is not injective.

Proof. Consider in \(H(WO_{q_2})\) the cohomology class of a monomial cocycle of the form
\[
z = y_1'' \wedge y_2'' \wedge \cdots \wedge c''_{q_2} = y_1'' \wedge y_2'' \wedge \cdots \wedge c''_{q_2}
\]
with \(\deg c''_{(j)} = 2q_2\), where \(q_2' = \lfloor (q_2 + 1)/2 \rfloor \geq 2\). Then, from [7] it follows that \(\Delta_{2*}[z] \neq 0 \in H(B \Gamma_{q_2}, R)\). On the other hand, by virtue of Corollary 5.2 in [7], the cohomology class \([z]\) is in the kernel of the canonical homomorphism \(W(d_{p_2})^*: H(WO_{q_2}) \to H(WO_1)\). Whence, in view of Proposition 3.4, we have \(\Delta_{2*}[z] \in \text{Ker} \phi_2^*\).

Remarks. (1) It is clear that \(\Delta_{2*}[1 \otimes e''_{q_2}] \in \text{Ker} \phi_2^*\) for \((q_1, q_2) = (2n - 1, 2m)\) with \(0 < q_1 < q_2\). Unfortunately, we have been unable to prove that \(\Delta_{2*}[1 \otimes e''_{q_2}] \neq 0\). (2) A geometric interpretation for nontrivial elements of the kernel of the canonical homomorphism \(W(d_{p_2})^*\) has been given in [7] (see also [5]). (3) In a similar way, we show that the canonical homomorphisms
\[
\phi_2^* : H(B \Gamma_{q_2}, R) \to H(\Gamma, R)
\]
and
\[
\tilde{\phi}_2^* : H(F \Gamma_{q_2}, R) \to H(\Gamma, R)
\]
are not injective for \(0 < q_1 < q_2\). Evidently, \(\Delta'_*[1 \otimes e''_{m}] \in \text{Ker} \phi_2^*\) is not zero for \((q_1, q_2) = (2n - 1, 2m)\) with \(0 < q_1 < q_2\), where \(e''_{m} \in \Lambda^{2m}(SO(q_2))\) is the Pfaffian polynomial for \(q_2 = 2m\). Analogously, it is easily shown that the element \(\tilde{\Delta}_*[y_1'' \wedge y_2'' \otimes c''_{(j)}] \in \text{Ker} \tilde{\phi}_2^*\) is not zero for \(\deg c''_{(j)} = 2q_2\) with \(0 < q_1 < q_2\).
