STABLE BRANCHING RULES
FOR CLASSICAL SYMMETRIC PAIRS

ROGER HOWE, ENG-CHYE TAN, AND JEB F. WILLENBRING

Abstract. We approach the problem of obtaining branching rules from the point of view of dual reductive pairs. Specifically, we obtain a stable branching rule for each of 10 classical families of symmetric pairs. In each case, the branching multiplicities are expressed in terms of Littlewood-Richardson coefficients. Some of the formulas are classical and include, for example, Littlewood’s restriction rule as a special case.

1. Introduction

Given completely reducible representations, $V$ and $W$ of complex algebraic groups $G$ and $H$ respectively, together with an embedding $H \hookrightarrow G$, we let $[V, W] = \dim \text{Hom}_H (W, V)$, where $V$ is regarded as a representation of $H$ by restriction. If $W$ is irreducible, then $[V, W]$ is the multiplicity of $W$ in $V$. This number may of course be infinite if $V$ or $W$ is infinite dimensional. A description of the numbers $[V, W]$ is referred in the mathematics and physics literature as a branching rule.

The context of this paper has its origins in the work of D. Littlewood. In [Li2], Littlewood describes two classical branching rules from a combinatorial perspective (see also [Li1]). Specifically, Littlewood’s results are branching multiplicities for $GL_n$ to $O_n$ and $GL_{2n}$ to $Sp_{2n}$. These pairs of groups are significant in that they are examples of symmetric pairs. A symmetric pair is a pair of groups $(H, G)$ such that $G$ is a reductive algebraic group and $H$ is the fixed point set of a regular involution defined on $G$. It follows that $H$ is a closed, reductive algebraic subgroup of $G$.

The goal of this paper is to put the formula into the context of the first-named author’s theory of dual reductive pairs. The advantage of this point of view is that it relates branching from one symmetric pair to another and as a consequence Littlewood’s formula may be generalized to all classical symmetric pairs.

Littlewood’s result provides an expression for the branching multiplicities in terms of the classical Littlewood-Richardson coefficients (to be defined later) when the highest weight of the representation of the general linear group lies in a certain stable range.

The point of this paper is to show how when the problem of determining branching multiplicities is put in the context of dual pairs, a Littlewood-like formula results.
for any classical symmetric pair. To be precise, we consider 10 families of symmetric pairs which we group into subsets determined by the embedding of $H$ in $G$ (see Table I in §3).

1.1. Parametrization of representations. Let $G$ be a classical reductive algebraic group over $\mathbb{C}$: $G = GL_n(\mathbb{C}) = GL_n$, the general linear group; or $G = O_n(\mathbb{C}) = O_n$, the orthogonal group; or $G = Sp_{2n}(\mathbb{C}) = Sp_{2n}$, the symplectic group. We shall explain our notations on irreducible representations of $G$ using integer partitions. In each of these cases, we select a Borel subalgebra of the classical Lie algebra as is done in [GW]. Consequently, all highest weights are parameterized in the standard way (see [GW]).

A non-negative integer partition $\lambda$, with $k$ parts, is an integer sequence $\lambda_1 \geq \lambda_2 \geq \ldots \geq \lambda_k > 0$. Sometimes we may refer to partitions as Young or Ferrers diagrams. We use the same notation for partitions as is done in [Ma]. For example, we write $\ell(\lambda)$ to denote the length (or depth) of a partition, $|\lambda|$ for the size of a partition (i.e., $|\lambda| = \sum \lambda_i$). Also, $\lambda'$ denotes the transpose (or conjugate) of $\lambda$ (i.e., $\lambda'_i = |\{j : \lambda_j \geq i\}|$). A partition where all parts are even is called an even partition, and we shall denote an even partition $2\delta_1 \geq 2\delta_2 \geq \ldots \geq 2\delta_k$ simply by $2\delta$.

**GL$_n$ representations:** Given non-negative integers $p$ and $q$ such that $n \geq p + q$ and non-negative integer partitions $\lambda^+$ and $\lambda^-$ with $p$ and $q$ parts respectively, let $F_{(n)}^{(\lambda^+, \lambda^-)}$ denote the irreducible rational representation of $GL_n$ with highest weight given by the $n$-tuple

$$ (\lambda^+, \lambda^-) = (\lambda_1^+, \lambda_2^+, \ldots, \lambda_p^+, 0, \ldots, 0, -\lambda_1^-, \ldots, -\lambda_q^-). $$

If $\lambda^- = (0)$, then we will write $F_{(n)}^{\lambda^+}$ for $F_{(n)}^{(\lambda^+, \lambda^-)}$. Note that if $\lambda^+ = (0)$, then $(F_{(n)}^{\lambda^-})^*$ is equivalent to $F_{(n)}^{(\lambda^+, \lambda^-)}$.

**O$_n$ representations:** The complex (or real) orthogonal group has two connected components. Because the group is disconnected we cannot index irreducible representation by highest weights. There is however an analog of Schur-Weyl duality for the case of $O_n$ in which each irreducible rational representation is indexed uniquely by a non-negative integer partition $\nu$ such that $(\nu')_1 + (\nu')_2 \leq n$. That is, the sum of the first two columns of the Young diagram of $\nu$ is at most $n$. (See [GW], Chapter 10, for details.) Let $E_{(n)}^{\nu}$ denote the irreducible representation of $O_n$ indexed by $\nu$ in this way.

The irreducible rational representations of $SO_n$ may be indexed by their highest weight, since the group is a connected reductive linear algebraic group. In [GW], Section 5.2.2, the irreducible representations of $O_n$ are determined in terms of their restrictions to $SO_n$ (which is a normal subgroup having index 2). See [GW], Sections 10.2.4 and 10.2.5, for the correspondence between this parametrization and the above parametrization by partitions.

**Sp$_{2n}$ representations:** For a non-negative integer partition $\nu$ with $p$ parts where $p \leq n$, let $V_{(2n)}^{\nu}$ denote the irreducible rational representation of $Sp_{2n}$, where the
highest weight indexed by the partition $\nu$ is given by the $n$ tuple
\[ (\nu_1, \nu_2, \cdots, \nu_p, 0, \cdots, 0) \].

1.2. Littlewood-Richardson coefficients. Fix a positive integer $n_0$. Let $\lambda$, $\mu$ and $\nu$ denote non-negative integer partitions with at most $n_0$ parts. For any $n \geq n_0$ we have
\[ \left[ F_\lambda^{(n)} \otimes F_\mu^{(n)} \right] = \left[ F_\lambda^{(n_0)} \otimes F_\mu^{(n_0)} \right] \]
And so we define
\[ c_{\lambda \mu}^{\nu} := \left[ F_\lambda^{(n)} \otimes F_\mu^{(n)} \right] \]
for some (indeed any) $n \geq n_0$.

The numbers $c_{\lambda \mu}^{\nu}$ are known as the Littlewood-Richardson coefficients and are extensively studied in the algebraic combinatorics literature. Many treatments are defined from wildly different points of view. See [BKW], [CGR], [Fu], [GW], [JK], [Kn1], [Ma], [Sa], [St3] and [Su] for examples.

1.3. Stability and the Littlewood restriction rules. We now state the Littlewood restriction rules.

**Theorem 1.1** ($O_n \subseteq GL_n$). Given $\lambda$ such that $\ell(\lambda) \leq \frac{n}{2}$ and $\mu$ such that $(\mu')_1 + (\mu')_2 \leq n$, then
\[ \left[ F_\lambda^{(n)} \right] = \sum_{2\delta} c_{\lambda \mu}^{\nu} \]
where the sum is over all non-negative even integer partitions $2\delta$.

**Theorem 1.2** ($Sp_{2n} \subseteq GL_{2n}$). Given $\lambda$ such that $\ell(\lambda) \leq n$ and $\mu$ such that $\ell(\mu) \leq n$, then
\[ \left[ F_\lambda^{(2n)} \right] = \sum_{2\delta} c_{\lambda \mu}^{\nu}(2\delta') \]
where the sum is over all non-negative integer partitions with even columns $(2\delta)'$.

Notice that the hypotheses of the above two theorems do not include an arbitrary parameter for the representation of the general linear group. The parameters which fall within this range are said to be in the stable range. These hypotheses are necessary but for certain $\mu$ it is possible to weaken them considerably; see [EW1] and [EW2].

One purpose of this paper is to make the first steps toward a uniform stable range valid for all symmetric pairs. In the situation presented here we approach the stable range on a case-by-case basis. Within the stable range, one can express the branching multiplicity in terms of the Littlewood-Richardson coefficients. These kinds of branching rules will later be combined with the rich combinatorics literature on the Littlewood-Richardson coefficients to provide more algebraic structure to branching rules.
2. Statement of the results

We now state our main theorem. It addresses 10 families of symmetric pairs, which we state in 10 parts. The parts are grouped into 4 subsets named: Diagonal, Direct sum, Polarization and Bilinear form. These names describe the embedding of $H$ into $G$ (see Table I of §3).

Main Theorem.

2.1. Diagonal.

2.1.1. $\text{GL}_n \subset \text{GL}_n \times \text{GL}_n$. Given non-negative integers, $p$, $q$, $r$ and $s$ with $n \geq p + q + r + s$. Let $\lambda^+, \mu^+, \nu^+, \lambda^-, \mu^-, \nu^-$ be non-negative integer partitions. If $\ell(\lambda^+) \leq p + r$, $\ell(\lambda^-) \leq q + s$, $\ell(\mu^+) \leq p$, $\ell(\mu^-) \leq q$, $\ell(\nu^+) \leq r$ and $\ell(\nu^-) \leq s$, then

$$\left[ F_{(n)}^{(\mu^+, \nu^-)} \otimes F_{(n)}^{(\nu^+ \mu^-)} \right]_{\ell(\lambda^+, \lambda^-)} = \sum c_{\alpha_1 \beta_1 \gamma_1}^{\lambda_1} c_{\alpha_2 \gamma_2}^{\mu_2} c_{\beta_2 \gamma_2}^{\nu_2} c_{\beta_1 \gamma_1}^{\mu_1} c_{\beta_1 \gamma_1}^{\nu_1} c_{\beta_1 \gamma_1}^{\mu_1} c_{\beta_1 \gamma_1}^{\nu_1},$$

where the sum is over non-negative integer partitions $\alpha_1$, $\alpha_2$, $\beta_1$, $\beta_2$, $\gamma_1$ and $\gamma_2$.

2.1.2. $O_n \subset O_n \times O_n$. Given non-negative integer partitions $\lambda$, $\mu$ and $\nu$ such that $\ell(\lambda) \leq [n/2]$ and $\ell(\mu) + \ell(\nu) \leq [n/2]$, then

$$\left[ E_{(n)}^{\mu} \otimes E_{(n)}^{\nu} \right]_{\ell(\lambda)} = \sum c_{\alpha_1 \beta_1 \gamma_1}^{\lambda_1} c_{\alpha_2 \alpha_2}^{\mu_1} c_{\beta_2 \beta_2}^{\nu_1},$$

where the sum is over all non-negative integer partitions $\alpha_1$, $\beta_1$, $\gamma_1$.

2.1.3. $\text{Sp}_{2n} \subset \text{Sp}_{2n} \times \text{Sp}_{2n}$. Given non-negative integer partitions $\lambda$, $\mu$ and $\nu$ such that $\ell(\lambda) \leq n$ and $\ell(\mu) + \ell(\nu) \leq n$, then

$$\left[ V_{(2n)}^{\mu} \otimes V_{(2n)}^{\nu} \right]_{\ell(\lambda)} = \sum c_{\alpha_1 \beta_1 \gamma_1}^{\lambda_1} c_{\alpha_2 \alpha_2}^{\mu_1} c_{\beta_2 \beta_2}^{\nu_1},$$

where the sum is over all non-negative integer partitions $\alpha_1$, $\beta_1$, $\gamma_1$.

2.2. Direct sum.

2.2.1. $\text{GL}_n \times \text{GL}_m \subset \text{GL}_{n+m}$. Let $p$ and $q$ be non-negative integers such that $p + q \leq \min(n, m)$. Let $\lambda^+, \mu^+, \nu^+$ and $\lambda^-, \mu^-, \nu^-$ be non-negative integer partitions. If $\ell(\lambda^+), \ell(\mu^+), \ell(\nu^+) \leq p$ and $\ell(\lambda^-), \ell(\mu^-), \ell(\nu^-) \leq q$, then

$$\left[ F_{(n+m)}^{(\mu^+, \nu^-)} \otimes F_{(m)}^{(\nu^+ \mu^-)} \right]_{\ell(\lambda^+, \lambda^-)} = \sum c_{\alpha_1 \beta_1 \gamma_1}^{\lambda_1} c_{\alpha_2 \gamma_2}^{\mu_2} c_{\beta_2 \gamma_2}^{\nu_2},$$

where the sum is over all non-negative integer partitions $\gamma^+$, $\gamma^-$, $\delta$.

2.2.2. $O_n \times O_m \subset O_{n+m}$. Let $\lambda$, $\mu$ and $\nu$ be non-negative integer partitions such that $\ell(\lambda), \ell(\mu), \ell(\nu) \leq \frac{1}{2} \min(n, m)$. Then

$$\left[ E_{(n+m)}^{\mu} \otimes E_{(m)}^{\nu} \right]_{\ell(\lambda)} = \sum c_{\alpha_1 \beta_1 \gamma_1}^{\lambda_1} c_{\alpha_2 \gamma_2}^{\mu_2},$$

where the sum is over all non-negative integer partitions $\delta$ and $\gamma$.

2.2.3. $\text{Sp}_{2n} \times \text{Sp}_{2m} \subset \text{Sp}_{2(n+m)}$. Let $\lambda$, $\mu$ and $\nu$ be non-negative integer partitions such that $\ell(\lambda), \ell(\mu), \ell(\nu) \leq \min(n, m)$. Then

$$\left[ V_{(2(n+m))}^{\mu} \otimes V_{(2m)}^{\nu} \right]_{\ell(\lambda)} = \sum c_{\alpha_1 \beta_1 \gamma_1}^{\lambda_1},$$

where the sum is over all non-negative integer partitions $\delta$ and $\gamma$. 
2.3. Polarization.

2.3.1. $\text{GL}_n \subset \text{O}_{2n}$. Let $\mu^+, \mu^-$ and $\lambda$ be non-negative integer partitions with at most $\lfloor n/2 \rfloor$ parts. Then

$$\left[ E^\lambda_{(2n)}, F_{(n)}^{(\mu^+, \mu^-)} \right] = \sum c^\gamma_{\mu^+ \mu^-} c^\lambda_{(2\delta)'},$$

where the sum is over all non-negative integer partitions $\delta$ and $\gamma$.

2.3.2. $\text{GL}_n \subset \text{Sp}_{2n}$. Let $\mu^+, \mu^-$ and $\lambda$ be non-negative integer partitions with at most $\lfloor n/2 \rfloor$ parts. Then

$$\left[ V^\lambda_{(2n)}, F_{(n)}^{(\mu^+, \mu^-)} \right] = \sum c^\gamma_{\mu^+ \mu^-} c^\lambda_{(2\delta)},$$

where the sum is over all non-negative integer partitions $\delta$ and $\gamma$.

2.4. Bilinear form.

2.4.1. $\text{O}_n \subset \text{GL}_n$. Let $\lambda^+, \lambda^-$ and $\mu$ denote non-negative integer partitions with at most $\lfloor n/2 \rfloor$ parts. Then

$$\left[ F_{(n)}^{(\lambda^+, \lambda^-)}, E^\mu_{(n)} \right] = \sum c^\mu_{\alpha \beta} c^\lambda_{(2\gamma)'},$$

where the sum is over all non-negative integer partitions $\alpha, \beta, \gamma$ and $\delta$.

2.4.2. $\text{Sp}_{2n} \subset \text{GL}_{2n}$. Let $\lambda^+, \lambda^-$ and $\mu$ denote non-negative integer partitions with at most $n$ parts. Then

$$\left[ F_{(2n)}^{(\lambda^+, \lambda^-)}, V^\mu_{(2n)} \right] = \sum c^\mu_{\alpha \beta} c^\lambda_{(2\gamma)'},$$

where the sum is over all non-negative integer partitions $\alpha, \beta, \gamma$ and $\delta$.

2.5. Remarks. Although a thorough survey is beyond our present goals, we wish to record here many previous works on branching rules which in many cases overlap with ours. We are grateful to the referee who has given us an extensive list of references with comments on related works by experts. We shall briefly summarize related works as follows:

(a) Diagonal: The first rule 2.1.1 appears as (4.6) with (4.15) in King’s paper [Ki2]. The branching rules 2.1.2 and 2.1.3 for orthogonal and symplectic groups goes back to Newell [Ne] and Littlewood [Li3]. A more rigorous account of the Diagonal rules also appears in [Ki4], along with a treatment of rational representations of $\text{GL}_n$. See Theorem 4.5 and Theorem 4.1 of [Ki4] and the references therein. Our methods are also cast in this same generality. Further, 2.1.2 and 2.1.3 are beautifully presented in Sundaram’s survey [Su] with references to the proofs in [BKW].

(b) Direct sum: Rule 2.2.1 appears as (5.8) with (4.16) in one of the earlier works of King [Ki1], which derives from a conjecture in the Ph.D. thesis by Abramsky [Ab]. These branching rules are also addressed in [Ko] and [KT]. Specifically, 2.2.1 can be found in Proposition 2.6 of [Ko], and 2.2.2 and 2.2.3 can be found in Theorem 2.5 and Corollary 2.6 of [KT]. An account of the Direct Sum rules also appears in [Ki4] (see (2.1.6) and the references therein).

(c) Polarization: The polarization branching rules 2.3.1 and 2.3.2 are stated as (4.21) and (4.22), respectively, in [Ki3], and also as Theorem A1 of [KT].
Bilinear form: The Littlewood restriction rule is a special case of formulas 2.4.1 and 2.4.2 (see [Li1] and [Li2]). These two formulas can be viewed as a generalization of Littlewood’s restriction rule. Besides the Diagonal branching formulas, [Su] also presents a thorough treatment of the classical Littlewood restriction rules. However, in the most general form, rules 2.4.1 and 2.4.2 appear as (5.7) with (4.19), and (5.8) with (4.23) respectively in [Ki2].

Most of the results have been sufficiently well known by experts. For a well-presented survey of the representation theory of the classical groups from a combinatorial point of view we refer the reader to [Su]. Also, the late Wybourne and his students have even incorporated these results in the software package SCHUR downloadable at http://smc.vnet.net/Schur.html. This package implements all the modification rules given in[Ki2] and[BKW] that allow the stable branching rules to be generalized so as to cover all possible non-stable cases as well.

From our point of view, it is striking that the theory of dual pairs leads to proofs of all 10 of these formulas in such a unified manner. We feel that this unifying theme should be brought out in the literature more systematically than it has been.

In [Su], Theorem 5.4, it is shown how the Littlewood Richardson rule for branching from $GL_{2n}$ to $Sp_{2n}$ may be modified to obtain a version of the Littlewood restriction rule which is valid outside the stable range. Removing the stability condition for Littlewood’s restriction rules is a delicate problem, which was also addressed in [EW1] and [EW2]. Classically, Newell [Ne] presents modification rules to the Littlewood restriction rules to solve the branching problem outside of the stable range (see [Su] and [Ki2]). For some recent remarks on the literature of branching rules we refer the reader to [Ki3], [Kn2], [Kn3], [Kn4] and [Pr]. The discussions in [Kn2] are relevant to our approach. Some of the results in [Kn2] are important special cases of the results in [GK].

While we only require decompositions of tensor products of infinite-dimensional holomorphic discrete series as in [Re], we also wish to note the numerous works in more generality which can be found in [RWB], [KW], [TTW], [OZ] and [KTW], among many others. It is interesting to note that the papers [RWB], [KW], [TTW] and [KTW] have exploited the duality correspondence (see §3.1) to relate the multiplicities of tensor products of infinite-dimensional representations to multiplicities of tensor products of finite-dimensional representations in the same spirit of [Ho1].

3. Dual pairs and reciprocity

The formulation of classical invariant theory in terms of dual pairs [Ho2] allows one to realize branching properties for classical symmetric pairs by considering concrete realizations of representations on algebras of polynomials on vector spaces.

3.1. Dual pairs and duality correspondence. Let $W \cong \mathbb{R}^{2m}$ be a $2m$-dimensional real vector space with symplectic form $\langle \cdot, \cdot \rangle$. Let $Sp(W) = Sp_{2m}(\mathbb{R})$ denote the isometry group of the form $\langle \cdot, \cdot \rangle$. A pair of subgroups $(G, G')$ of $Sp_{2m}(\mathbb{R})$ is called a reductive dual pair (in $Sp_{2m}(\mathbb{R})$) if

(a) $G$ is the centralizer of $G'$ in $Sp_{2m}(\mathbb{R})$ and vice versa, and
(b) both $G$ and $G'$ act reductively on $W$. 
The fundamental group of $Sp_{2m}(\mathbb{R})$ is the fundamental group of $U_m$, its maximal compact subgroup, and is isomorphic to $\mathbb{Z}$. Let $\widetilde{Sp}_{2m}(\mathbb{R})$ denote a choice of a double cover of $Sp_{2m}(\mathbb{R})$. We will refer to this as the metaplectic group. Also let $\tilde{U}_m$ denote the pull-back of the covering map on $U_m$. Shale-Weil constructed a distinguished representation $\omega$ of $\widetilde{Sp}_{2m}(\mathbb{R})$, which we shall refer to as the oscillator representation. This is a unitary representation and one realization is on the space of holomorphic functions on $\mathbb{C}^m$, commonly referred to as the Fock space. In this realization, the $\tilde{U}_m$-finite functions appear as polynomials on $\mathbb{C}^m$ which we denote as $\mathcal{P}(\mathbb{C}^m)$. A vector $v \in \mathcal{P}(\mathbb{C}^m)$ is $\tilde{U}_m$-finite if the span of $\tilde{U}_m \cdot v$ in $\mathcal{P}(\mathbb{C}^m)$ is finite dimensional.

Choose $z_1, z_2, \ldots, z_m$ as a system of coordinates on $\mathbb{C}^m$. The Lie algebra action of $sp_{2m}$ (the complexified Lie algebra of $Sp_{2m}(\mathbb{R})$) on $\mathcal{P}(\mathbb{C}^m)$ can be described by the following operators:

\begin{equation}
\omega(sp_{2m}) = sp_{2m}^{(1,1)} \oplus sp_{2m}^{(2,0)} \oplus sp_{2m}^{(0,2)},
\end{equation}

where

\begin{align}
sp_{2m}^{(1,1)} &= \text{Span} \left\{ \frac{1}{2} \left( z_i \frac{\partial}{\partial z_j} + z_j \frac{\partial}{\partial z_i} \right) \right\}, \\
sp_{2m}^{(2,0)} &= \text{Span} \left\{ z_i z_j \right\}, \\
sp_{2m}^{(0,2)} &= \text{Span} \left\{ \frac{\partial^2}{\partial z_i \partial z_j} \right\}.
\end{align}

The decomposition (3.1) is an instance of the complexified Cartan decomposition

\begin{equation}
sp_{2m} = \mathfrak{k} \oplus \mathfrak{p}^+ \oplus \mathfrak{p}^-,
\end{equation}

where $sp_{2m}^{(1,1)} \simeq \omega(\mathfrak{k})$, $sp_{2m}^{(2,0)} \simeq \omega(\mathfrak{p}^+)$ and $sp_{2m}^{(0,2)} \simeq \omega(\mathfrak{p}^-)$. If $\mathcal{P}(\mathbb{C}^m) = \sum_{s \geq 0} \mathcal{P}^s(\mathbb{C}^m)$ is the natural grading on $\mathcal{P}(\mathbb{C}^m)$, it is immediate that $sp_{2m}^{(i,j)}$ brings $\mathcal{P}^s(\mathbb{C}^m)$ to $\mathcal{P}^{s+i-j}(\mathbb{C}^m)$.

Let us restrict our dual pairs to the following:

\begin{equation}
(\mathfrak{o}_n(\mathbb{R}), Sp_{2k}(\mathbb{R})), \quad (U_n, U_{p,q}), \quad (Sp(n), O_{2k}^*).
\end{equation}

Observe that the first member is compact, and these pairs are usually loosely referred to as compact pairs.

To avoid technicalities involving covering groups, instead of the real groups $(G_0, G'_0)$, we shall discuss in the context of pairs $(G, \mathfrak{g}')$, where $G$ is a complexification of $G_0$ and $\mathfrak{g}'$ is a complexification of the Lie algebra of $G_0$. The use of the phrase “up to a central character” in the statements (a) to (c) below basically suppresses the technicalities involving covering groups. Each of these pairs can be conveniently realized as follows:

(a) $(\mathfrak{o}_n(\mathbb{R}), Sp_{2k}(\mathbb{R})) \subset Sp_{2nk}(\mathbb{R})$: Let $\mathbb{C}^n \otimes \mathbb{C}^k$ be the space of $n$ by $k$ complex matrices. The complexified pair $(\mathfrak{o}_n, sp_{2k})$ acts on $\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^k)$ which are the $\tilde{U}_{nk}$-finite functions. The group $O_n$ acts by left multiplication on $\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^k)$ and can be identified with the holomorphic extension of the $O_n(\mathbb{R})$ action on the Fock space. The action of the subalgebra $\mathfrak{gl}_k$ of $sp_{2k}$ is (up to a central character) the derived action coming from the natural right action of multiplication by $GL_k$. 
(b) \( (U_n, U_{p,q}) \subset S_{p2n(p+q)}(\mathbb{R}) \):

For this pair, we may identify the \( \widetilde{U}_{n(p+q)} \)-finite functions with the polynomial ring \( \mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^p \oplus (\mathbb{C}^n)^* \otimes \mathbb{C}^q) \). The complexified pair is \( (GL_n, \mathfrak{gl}_{p,q}) \).

There is a natural action of \( GL_n \) and \( GL_p \times GL_q \) on this polynomial ring as follows:

\[
(g, h_1, h_2) \cdot F(X, Y) = F(g^{-1}Xh_1, g^\dagger Yh_2),
\]

where \( X \in \mathbb{C}^n \otimes \mathbb{C}^p, Y \in (\mathbb{C}^n)^* \otimes \mathbb{C}^q, g \in GL_n, h_1 \in GL_p, \) and \( h_2 \in GL_q \). Obviously both left and right actions commute. Here \( \mathfrak{gl}_{p,q} \approx \mathfrak{gl}_{p+q} \), but we choose to differentiate the two because of the role of the subalgebra \( \mathfrak{gl}_p \oplus \mathfrak{gl}_q \), which acts by (up to a central character) the derived action of \( GL_p \times GL_q \) on the polynomial ring.

(c) \( (Sp(n), O_{2k}) \subset S_{4nk}(\mathbb{R}) \):

In this case, \( \mathcal{P}(\mathbb{C}^{2n} \otimes \mathbb{C}^k) \) are the \( \widetilde{U}_{2nk} \)-finite functions, with natural left and right actions by \( S_{2nk} \) and \( GL_k \), respectively. The complexified pair is \( (Sp_{2n}, \mathfrak{o}_{2k}) \), where the subalgebra \( \mathfrak{so}_k \) of \( \mathfrak{so}_k \) acts by (up to a central character) the derived right action of \( GL_k \).

With the realizations of these compact pairs \( (G, \mathfrak{g}') \subset S_{2m}(\mathbb{R}) \), let us look at the representations that appear. Form

\[
\mathfrak{g}'^{(i,j)} = \mathfrak{sp}_{2m}^{(i,j)} \cap \omega(\mathfrak{g}')
\]

to get

\[
(3.5) \quad \omega(\mathfrak{g}') = \mathfrak{g}'^{(1,1)} \oplus \mathfrak{g}'^{(2,0)} \oplus \mathfrak{g}'^{(0,2)}.
\]

Observe that \( G_0' \) is Hermitian symmetric in all three cases, and the decomposition above is an instance of the complexified Cartan decomposition

\[
(3.6) \quad \mathfrak{g}' = \mathfrak{t}' \oplus \mathfrak{p}'^+ \oplus \mathfrak{p}'^-,
\]

where \( \mathfrak{g}'^{(1,1)} \simeq \omega(\mathfrak{t}') \), \( \mathfrak{g}'^{(2,0)} \simeq \omega(\mathfrak{p}'^+) \) and \( \mathfrak{g}'^{(0,2)} \simeq \omega(\mathfrak{p}'^-) \). In particular, \( \mathfrak{t}' \) has a one-dimensional center and \( \mathfrak{p}'^\pm \) are the \( \pm i \) eigenspaces of this center. Each \( \mathfrak{p}'^\pm \) is an abelian Lie algebra. Note, in particular, that

\[
(3.7) \quad [\mathfrak{g}'^{(1,1)}, \mathfrak{g}'^{(2,0)}] \subset \mathfrak{g}'^{(2,0)} \quad \text{and} \quad [\mathfrak{g}'^{(1,1)}, \mathfrak{g}'^{(0,2)}] \subset \mathfrak{g}'^{(0,2)}.
\]

A representation \( (\rho, V_{\rho}) \) of \( \mathfrak{g}' \) is holomorphic if there is a non-zero vector \( v_0 \in V_{\rho} \) killed by \( \rho(\mathfrak{p}'^-) \). The following are the key properties of holomorphic representations:

(a) There is a non-trivial subspace

\[
(V_{\rho})_0 = \ker \rho(\mathfrak{p}'^-) = \{ v \in V_{\rho} \mid \rho(Y) \cdot v = 0 \text{ for all } Y \in \mathfrak{p}'^- \}
\]

which is \( \mathfrak{t}' \) irreducible. This is known as the lowest \( \mathfrak{t}' \)-type of \( \rho \).

(b) \( V_{\rho} \) is generated by \( (V_{\rho})_0 \), more precisely,

\[
V_{\rho} = \mathcal{U}(\mathfrak{p}'^+) \cdot V_0 = \mathcal{S}(\mathfrak{p}'^+) \cdot V_0.
\]

The second equality results because \( \mathfrak{p}'^+ \) is abelian.
Now one of the key features in the formalism of dual pairs is the branching decomposition of the oscillator representation. The branching property for compact pairs alluded to is (see [Ho2] and the references therein)

\[ P(C^m) \mid_{G \times g'} = \bigoplus_{\tau \in S \subset \hat{G}} \tau \otimes V_{\tau'}, \]

where \( S \) is a subset of the set of irreducible representations of \( G \), denoted by \( \hat{G} \). The representations \( V_{\tau'} \) (written to emphasize the correspondence \( \tau \leftrightarrow \tau' \) and the dependence on \( \tau \in \hat{G} \)) are irreducible holomorphic representations of \( g' \). They are known to be derived modules of irreducible unitary representations of some appropriate cover of \( G'_0 \) ([Ho3]). The key feature of this branching is the uniqueness of the correspondence, i.e., a representation of \( G \) appearing uniquely determines the representation of the \( g' \) module that appears and vice-versa. We refer to this as the duality correspondence.

This duality is subjugated to another correspondence in the space of harmonics.

**Theorem 3.1 ([Ho2], [KV]).** Let \( \mathcal{H} = \ker g^{(0,2)} \) be the space of harmonics. Then \( \mathcal{H} \) is a \( G \times K' \) module, and it admits a multiplicity-free \( G \times K' \) (hence \( G \times k' \)) decomposition

\[ \mathcal{H} = \bigoplus_{\tau \in S \subset \hat{G}} \tau \otimes \ker \rho_\tau'(g^{(0,2)}). \]

We also have the separation of variables theorem providing the following \( G \times g' \) decomposition:

\[ P(C^m) = \mathcal{H} \cdot S(g^{(2,0)}) = \left\{ \bigoplus_{\tau \in S \subset \hat{G}} \tau \otimes \ker \rho_\tau'(g^{(0,2)}) \right\} \cdot S(g^{(2,0)}) = \bigoplus_{\tau \in S \subset \hat{G}} \tau \otimes V_{\tau'}. \]

The structure of \( V_{\tau'} \) is even nicer in certain category of pairs, which we will refer to as the stable range. The stable range refers to the following:

(a) \((O(n), Sp_{2k}(\mathbb{R}))\) for \( n \geq 2k \);
(b) \((U(n), U_{p,q})\) for \( n \geq p + q \);
(c) \((Sp(n), O_{2k})\) for \( n \geq k \).

In the stable range, the holomorphic representations of \( g' \) that occur have \( \mathfrak{t}' \)-structure which are nicer ([HC], [Sc1], [Sc2]); namely,

\[ V_{\tau'} = S(g^{(2,0)}) \otimes \ker \tau'(g^{(0,2)}). \]

They are known as holomorphic discrete series or limits of holomorphic discrete series (in some limiting cases of the parameters determining \( \tau' \)) of the appropriate covering group of \( G'_0 \). It is these representations that will feature prominently in this paper.

Let us conclude by describing the duality correspondence for the compact dual pairs in the stable range. Parts of the following well-known result can be found in several places; see [EHW], [HC], [Ho2], [Ho3], [Sc1], [Sc2] for example.
Theorem 3.2. \( (O_n(\mathbb{R}), Sp_{2k}(\mathbb{R})) \): The duality correspondence for \( O_n \times sp_{2k} \) is
\begin{equation}
P(C^n \otimes C^k) = \bigoplus_{\lambda} E_{(n)}^\lambda \otimes \tilde{E}_{(2k)}^\lambda,
\end{equation}
where \( \lambda \) runs through the set of all non-negative integer partitions such that \( l(\lambda) \leq k \) and \( (\lambda_1') + (\lambda_2') \leq n \). The space \( \tilde{E}_{(2k)}^\lambda \) is an irreducible holomorphic representation of \( sp_{2k} \) of lowest \( gl_k \)-type \( F_{(k)}^\lambda \). In the stable range \( n \geq 2k \),
\[ \tilde{E}_{(2k)}^\lambda \simeq S(sp_{2k}^{(2,0)}) \otimes \tilde{F}_{(k)}^\lambda \simeq S(S^2 C^k) \otimes F_{(k)}^\lambda. \]
(b) \( (U_n, U_{p,q}) \): The duality correspondence for \( GL_n \times gl_{p,q} \) is
\begin{equation}
P(C^n \otimes C^p \otimes (C^n)^* \otimes C^q) = \bigoplus_{\lambda^+, \lambda^-} F_{(n)}^{(\lambda^+, \lambda^-)} \otimes \tilde{F}_{(p,q)}^{(\lambda^+, \lambda^-)},
\end{equation}
where the sum is over all non-negative integer partitions \( \lambda^+ \) and \( \lambda^- \) such that \( l(\lambda^+) \leq p \), \( l(\lambda^-) \leq q \) and \( l(\lambda^+) + l(\lambda^-) \leq n \). The space \( \tilde{F}_{(p,q)}^{(\lambda^+, \lambda^-)} \) is an irreducible holomorphic representation of \( gl_{p,q} \) with lowest \( gl_p \oplus gl_q \)-type \( F_{(p)}^{\lambda^+} \otimes F_{(q)}^{\lambda^-} \). In the stable range \( n \geq p + q \),
\[ \tilde{F}_{(p,q)}^{(\lambda^+, \lambda^-)} \simeq S(gl_{p,q}^{(2,0)}) \otimes F_{(p)}^{\lambda^+} \otimes F_{(q)}^{\lambda^-} \simeq S(C^p \otimes C^q) \otimes F_{(p)}^{\lambda^+} \otimes F_{(q)}^{\lambda^-}. \]
The degenerate case when \( q = 0 \) is particularly interesting. This is the \( GL_n \times GL_p \) duality:
\begin{equation}
P(C^n \otimes C^p) = \bigoplus_{\lambda} F_{(n)}^\lambda \otimes F_{(p)}^\lambda,
\end{equation}
where the sum is over all integer partitions \( \lambda \) such that \( l(\lambda) \leq \min(n,p) \).
(c) \( (Sp(n), O_{2k}) \): The duality correspondence for \( Sp_{2n} \times so_{2k} \) is
\begin{equation}
P(C^{2n} \otimes C^k) = \bigoplus_{\lambda} V_{(2n)}^\lambda \otimes \tilde{V}_{(2k)}^\lambda,
\end{equation}
where \( \lambda \) runs through the set of all non-negative integer partitions such that \( l(\lambda) \leq \min(n,k) \). The space \( \tilde{V}_{(2k)}^\lambda \) is an irreducible holomorphic representation of \( so_{2k} \) of lowest \( gl_k \)-type \( F_{(k)}^\lambda \). In the stable range \( n \geq k \),
\[ \tilde{V}_{(2k)}^\lambda \simeq S(so_{2k}^{(2,0)}) \otimes F_{(k)}^\lambda \simeq S(S^2 C^k) \otimes F_{(k)}^\lambda. \]

3.2. Symmetric pairs and reciprocity pairs. In the context of dual pairs, we would like to understand the branching of irreducible representations from \( G \) to \( H \), for symmetric pairs \( (H,G) \). Table I lists the symmetric pairs which we will cover in this paper.

If \( G \) is a classical group over \( \mathbb{C} \), then \( G \) can be embedded as one member of a dual pair in the symplectic group as described in \([Ho2]\). The resulting pairs of groups are \( (GL_n, GL_m) \) or \( (O_n, Sp_{2m}) \), each inside \( Sp_{2nm} \), and are called irreducible dual pairs. In general, a dual pair of reductive groups in \( Sp_{2r} \) is a product of such pairs.

Proposition 3.1. Let \( G \) be a classical group, or a product of two copies of a classical group. Let \( G \) belong to a dual pair \( (G,G') \) in a symplectic group \( Sp_{2m} \). Let \( H \subset G \) be a symmetric subgroup, and let \( H' \) be the centralizer of \( H \) in \( Sp_{2m} \). Then \( (H,H') \) is also a dual pair in \( Sp_{2m} \), and \( G' \) is a symmetric subgroup inside \( H' \).
Recall the duality correspondence for $G$.

These can be shown by fairly easy case-by-case checking. These are shown in Table II. We call these pair of pairs reciprocity pairs. These are special cases of see-saw pairs [Ku].

Consider the dual pairs $(G, G')$ and $(H, H')$ in $Sp_{2m}$. We illustrate them in the see-saw manner as follows:

$$G \quad \quad \quad G'$$
$$\cup \quad \quad \quad \cap$$

$$H \quad \quad \quad H'$$

Recall the duality correspondence for $G \times g'$ and $H \times h'$ on the space $P(C^m)$:

$$P(C^m) |_{G \times g'} = \bigoplus_{\sigma \in S \subseteq \hat{G}} \sigma \otimes V_{\sigma'} = \bigoplus_{\sigma \in S \subseteq \hat{G}} P(C^m)_{\sigma \otimes \sigma'},$$

$$P(C^m) |_{H \times h'} = \bigoplus_{\tau \in T \subseteq \hat{H}} \tau \otimes W_{\tau'} = \bigoplus_{\tau \in T \subseteq \hat{H}} P(C^m)_{\tau \otimes \tau'},$$

where we have written $P(C^m)_{\sigma \otimes \sigma'}$ and $P(C^m)_{\tau \otimes \tau'}$ as the $\sigma \otimes \sigma'$-isotypic component and $\tau \otimes \tau'$-isotypic component in $P(C^m)$, respectively. Given $\sigma$ and $\tau'$, we can seek the $\sigma \otimes \tau'$-isotypic component in $P(C^m)$ in two ways as follows:

$$(3.15) \quad P(C^m)_{\sigma \otimes \tau'} \simeq (\sigma |_H)_{\tau} \otimes V_{\sigma'} \simeq \tau \otimes (W_{\tau'} |_{h'})_{\sigma'}.$$
In other words, we have the equality of multiplicities (as pointed out in [Ho1])

$$[\sigma, \tau] = [W_{\tau'}, V_{\sigma'}],$$

(3.16)

that is, the multiplicity of \( \tau \) in \( \sigma \mid_H \) is equal to the multiplicity of \( V_{\sigma'} \) in \( W_{\tau'} \mid_{h'}. \) This is good enough for our purposes in this paper. However, this equality of multiplicities is just a feature of some deeper phenomenon—an isomorphism of certain branching algebras which captures the respective branching properties.

3.3. Branching algebras. One approach to branching problems exploits the fact that the representations have a natural product structure, embodied by the algebra of regular functions on the flag manifold of the group. For a reductive complex algebraic \( G \), let \( N_G \) be a maximal unipotent subgroup of \( G \). The group \( N_G \) is determined up to conjugacy in \( G \). Let \( A_G \) denote a maximal torus which normalizes \( N_G \), so that \( B_G = A_G \cdot N_G \) is a Borel subgroup of \( G \). Let \( \hat{A}_G^+ \) be the set of dominant characters of \( A_G \)—the semigroup of highest weights of irreducible representations of \( G \). It is well known (see for instance, [Ho4]) that the space of regular functions on the coset space \( G/N_G \) decomposes (under the action of \( G \) by left translations) as a direct sum of one copy of each irreducible representation \( V_\psi \), of highest weight \( \psi \), of \( G \):

$$\mathcal{R}(G/N_G) \cong \bigoplus_{\psi \in \hat{A}_G^+} V_\psi.$$

We note that \( \mathcal{R}(G/N_G) \) has the structure of an \( \hat{A}_G^+ \)-graded algebra, for which the \( V_\psi \) are the graded components. Let \( H \subset G \) be a reductive subgroup and \( A_H = A_G \cap H \) be a maximal torus of \( H \) normalizing \( N_H \), a maximal unipotent subgroup of \( H \), so that \( B_H = A_H \cdot N_H \) is a Borel subgroup of \( H \). We consider the algebra \( \mathcal{R}(G/N_G)^{N_H} \) of functions on \( G/N_G \) which are invariant under left translations by \( N_H \). This is an \( (\hat{A}_G^+ \times \hat{A}_H^+) \)-graded algebra. Knowledge of \( \mathcal{R}(G/N_G)^{N_H} \) as a \( (\hat{A}_G^+ \times \hat{A}_H^+) \)-graded algebra tell us how representations of \( G \) decompose when restricted to \( H \), in other words, it describes the branching rule from \( G \) to \( H \). We will call \( \mathcal{R}(G/N_G)^{N_H} \) the \( (G, H) \) branching algebra. When \( G \simeq H \times H \), and \( H \) is embedded diagonally in \( G \), the branching algebra describes the decomposition of tensor products of representations of \( H \), and we then call it the tensor product algebra for \( H \).

Let us briefly explain how branching algebras, dual pairs and reciprocity are related. For a reciprocity pair \( (G, g'), (H, h') \), the duality correspondences are subjugated to a correspondence in the space of harmonics \( \mathcal{H} \) (see Theorem 3.1). Branching from holomorphic discrete series of \( h' \) to \( g' \) behaves very much like finite-dimensional representations in relation to their highest weights and is captured entirely by the branching from the lowest \( K_{H'} \)-type to \( K_G \). Although \( \mathcal{H} \) is not an algebra, it can still be identified as a quotient algebra of \( \mathcal{P}(\mathbb{C}^m) \). With the \( G \times K_G \) as well as \( H \times K_H \) multiplicity-free decomposition of \( \mathcal{H} \), one allows \( \mathcal{H}^{N_H \times N_K \cdot g'} \) to be interpreted as a branching algebra from \( K_{H'} \) to \( K_G \) as well as a branching algebra from \( G \) to \( H \). This double interpretation solves two related branching problems simultaneously. Classical invariant theory also provides a flexible approach which allows an inductive approach to the computation of branching algebras, and makes evident natural connections between different branching algebras. We refer to readers to [HTW] for more details.
4. Proofs

4.1. Proofs of the tensor product formulas.

4.1.1. $\text{GL}_n \subset \text{GL}_n \times \text{GL}_n$. We consider the following see-saw pair and its complexification:

$$U_n \times U_n \quad \text{Complexified} \quad GL_n \times GL_n \quad \mathfrak{g}_l \quad \text{Compressed} \quad \mathfrak{gl}_{p,q} \oplus \mathfrak{gl}_{r,s}$$

Regarding the dual pair $(GL_n, \mathfrak{g}_l \oplus \mathfrak{gl}_{r,s})$, Theorem 3.2 gives the decomposition

$$\mathcal{P} \left( (C^n \otimes C^p \oplus (C^n)^* \otimes C^p) \oplus (C^n \otimes C^r \oplus (C^n)^* \otimes C^r) \right) \cong \bigoplus \left( F(\mu^+,\mu^-) \otimes F(\nu^+,\nu^-) \right) \otimes \left( F(\mu^+,\nu^-) \otimes F(\nu^+,\mu^-) \right),$$

where the sum is over non-negative integer partitions $\mu^+, \nu^+, \mu^-$, and $\nu^-$ such that

$$\ell(\mu^+) \leq p, \quad \ell(\mu^-) \leq q, \quad \ell(\nu^+) \leq r, \quad \ell(\nu^-) \leq s, \quad \ell(\mu^+ + \nu^-) \leq n, \quad \ell(\nu^+ + \mu^-) \leq n.$$

Regarding the dual pair $(GL_n, \mathfrak{g}_{p+r,q+s})$, Theorem 3.2 gives the decomposition

$$\mathcal{P} \left( (C^n \otimes C^{p+r} \oplus (C^n)^* \otimes C^{q+s}) \right) \cong \bigoplus F(\lambda^+,\lambda^-) \otimes F(\mu^+,\lambda^-) \otimes F(\nu^+,\mu^-) \otimes F(\lambda^+,\nu^-),$$

where the sum is over all non-negative integer partitions $\lambda^+$ and $\lambda^-$ such that $\ell(\lambda^+) + \ell(\lambda^-) \leq n$, $\ell(\lambda^+) \leq p + r$ and $\ell(\lambda^-) \leq q + s$.

We assume that we are in the stable range: $n \geq p + q + r + s$, so that as a $GL_{p+r} \times GL_{q+s}$ representation (see Theorem 3.2),

$$\tilde{F}(\lambda^+,\lambda^-) \cong S(C^{p+r} \otimes C^{q+s}) \otimes F(\mu^+,\lambda^-) \otimes F(\nu^+,\mu^-) \otimes F(\lambda^+,\lambda^-).$$

As a $GL_p \times GL_q \times GL_r \times GL_s$-representation, $\tilde{F}(\lambda^+,\lambda^-)$ is equivalent to

$$S(C^p \otimes C^q) \otimes S(C^r \otimes C^s) \otimes S(C^p \otimes C^r) \otimes S(C^q \otimes C^s) \otimes F(\mu^+,\lambda^-) \otimes F(\nu^+,\lambda^-).$$

Note that $n \geq p + q + r + s$ implies that $n \geq p + q$ and $n \geq r + s$, so that (see Theorem 3.2)

$$\tilde{F}(\mu^+,\mu^-) \cong S(C^p \otimes C^q) \otimes F(\mu^+,\mu^-) \otimes F(\mu^+,\mu^-) \otimes F(\mu^+,\mu^-) \otimes F(\mu^+,\mu^-)$$

and

$$\tilde{F}(\nu^+,\nu^-) \cong S(C^r \otimes C^s) \otimes F(\mu^+,\mu^-) \otimes F(\mu^+,\mu^-) \otimes F(\mu^+,\mu^-) \otimes F(\mu^+,\mu^-).$$

Our see-saw pair implies (see (3.15))

$$\left[ F(\mu^+,\mu^-) \otimes F(\nu^+,\nu^-) \right] = \left[ \tilde{F}(\lambda^+,\lambda^-) \otimes F(\mu^+,\mu^-) \otimes F(\nu^+,\nu^-) \right].$$

Using the fact that we are in the stable range,

$$\left[ F(\mu^+,\mu^-) \otimes F(\nu^+,\nu^-) \right] = \left[ S(C^p \otimes C^q) \otimes S(C^r \otimes C^s) \otimes F(\mu^+,\lambda^-) \otimes F(\nu^+,\mu^-) \otimes F(\lambda^+,\lambda^-) \otimes F(\mu^+,\lambda^-) \otimes F(\nu^+,\mu^-) \otimes F(\lambda^+,\lambda^-) \otimes F(\mu^+,\lambda^-) \otimes F(\nu^+,\mu^-) \otimes F(\lambda^+,\lambda^-) \otimes F(\mu^+,\lambda^-) \otimes F(\nu^+,\mu^-) \otimes F(\lambda^+,\lambda^-) \otimes F(\mu^+,\lambda^-) \otimes F(\nu^+,\mu^-) \otimes F(\lambda^+,\lambda^-) \right].$$
Next we will combine the standard decompositions
\[
F^{\lambda^+}_{(p+r)} \cong \bigoplus \alpha_1 \alpha_2 F^{\alpha_1}_{(p)} \otimes F^{\alpha_2}_{(r)},
\]
\[
F^{\lambda^-}_{(q+s)} \cong \bigoplus \beta_1 \beta_2 F^{\beta_1}_{(q)} \otimes F^{\beta_2}_{(s)}
\]
with the multiplicity-free decompositions (see (3.12))
\[
S(\mathbb{C}^p \otimes \mathbb{C}^q) \cong \bigoplus F^{\gamma_1}_{(p)} \otimes F^{\gamma_1}_{(s)},
\]
\[
S(\mathbb{C}^r \otimes \mathbb{C}^s) \cong \bigoplus F^{\gamma_2}_{(r)} \otimes F^{\gamma_2}_{(q)}.
\]
This implies the result
\[
\left[F^{(\mu^+, \mu^-)}_{(n)} \otimes F^{(\nu^+, \nu^-)}_{(n)} \right] = \sum c^{(\lambda^+, \lambda^-)}_{\alpha_1 \alpha_2} c^{\mu^+}_{\alpha_1} c^{\mu^-}_{\alpha_2} c^{\nu^+}_{\beta_1} c^{\nu^-}_{\beta_2} c^{\lambda^-}_{\gamma_1} c^{\lambda^+}_{\gamma_2} c^{\mu_1}_{\beta_1} c^{\mu_2}_{\beta_2} c^{\nu_1}_{\gamma_1} c^{\nu_2}_{\gamma_2} c^{\mu_1}_{\beta_1} c^{\mu_2}_{\beta_2}.
\]

4.1.2. \( \mathbf{O}_n \subset \mathbf{O}_n \times \mathbf{O}_n \). We consider the following see-saw pair and its complexification:
\[
\mathbf{O}_n(\mathbb{R}) \times \mathbf{O}_n(\mathbb{R}) \rightarrow sp_{2p}(\mathbb{R}) \oplus sp_{2q}(\mathbb{R}) \quad \text{complexified}
\]
\[
\mathbf{O}_n(\mathbb{R}) \rightarrow sp_{2(p+q)}(\mathbb{R}) \quad \text{O}_n \rightarrow \mathbf{sp}_{2(p+q)}(\mathbb{R})
\]

Regarding the dual pair \((O_n \times O_n, \mathbf{sp}_{2p} \oplus \mathbf{sp}_{2q})\), Theorem 3.2 gives the decomposition
\[
\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^p \oplus \mathbb{C}^n \otimes \mathbb{C}^q) \cong \bigoplus \left(E^{(n)}_{(2p)} \otimes E^{(n)}_{(2q)}\right),
\]
where the sum is over non-negative integer partitions \(\mu\) and \(\nu\) such that
\[
\ell(\mu) \leq p, \quad (\mu_1') + (\mu_2') \leq n, \\
\ell(\nu) \leq q, \quad (\nu_1') + (\nu_2') \leq n.
\]

Regarding the dual pair \((O_n, \mathbf{sp}_{2(p+q)})\), Theorem 3.2 gives the decomposition
\[
\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^{p+q}) \cong \bigoplus \left(E^{(n)}_{(2q)} \otimes E^{(n)}_{(2p)}\right),
\]
where the sum is over all non-negative integer partitions \(\lambda\) such that \(\ell(\lambda) \leq p+q\), and \((\lambda_1') + (\lambda_2') \leq n\).

We assume that we are in the stable range: \(n \geq 2(p+q)\), so that as a \(GL_{p+q}\) representation (see Theorem 3.2),
\[
\widetilde{E}^\lambda_{(2(p+q))} \cong S(S^2 \mathbb{C}^{p+q}) \otimes F^{\lambda}_{(p+q)}.
\]
As a \(GL_p \times GL_q\)-representation, \(\widetilde{E}^\lambda_{(2(p+q))}\) is equivalent to
\[
S(S^2 \mathbb{C}^p) \otimes S(S^2 \mathbb{C}^q) \otimes S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F^{\lambda}_{(p+q)}.
\]
Note that \(n \geq 2(p+q)\) implies that \(n \geq 2p\) and \(n \geq 2q\), so that (see Theorem 3.2)
\[
\widetilde{E}^\mu_{(2p)} \cong S(S^2 \mathbb{C}^p) \otimes F^{\mu}_{(p)}
\]
and
\[
\widetilde{E}^{\nu}_{(2q)} \cong S(S^2 \mathbb{C}^q) \otimes F^{\nu}_{(q)}.
\]
Our see-saw pair implies (see (3.15)) that
\[
[E^{(n)}_{(n)} \otimes E^{(n)}_{(n)}] = [\widetilde{E}^\lambda_{(2(p+q))}, \widetilde{E}^\mu_{(2p)} \otimes \widetilde{E}^{\nu}_{(2q)}].
\]
Using the fact that we are in the stable range,
\[
\left[ E_{(2(p+q))}^\mu, E_{(2p)}^\nu \otimes E_{(2q)}^\lambda \right] = \left[ S(S^2C^p) \otimes S(S^2C^q) \otimes C^\nu \otimes C^\lambda \right] = \left[ S(C^p \otimes C^q) \otimes F_{(p+q)}^\lambda, S(S^2C^q) \otimes F_{(p)}^\mu \otimes S(S^2C^p) \otimes F_{(q)}^\nu \right].
\]
Next we will combine the decomposition
\[
F_{(p+q)}^\lambda \cong \bigoplus \alpha \beta \gamma c_{\alpha \beta}^\lambda F_{(p)}^\alpha \otimes F_{(q)}^\beta
\]
with the multiplicity-free decomposition (see (3.12))
\[
S(C^p \otimes C^q) \cong \bigoplus F_{(p)}^\gamma \otimes F_{(q)}^\gamma
\]
to obtain the result, but first note that in the above decompositions \(\alpha, \beta,\) and \(\gamma\) range over all non-negative integer partitions such that \(\ell(\alpha) \leq p, \ell(\beta) \leq q\) and \(\ell(\gamma) \leq \min(p, q)\). So we obtain
\[
\left[ E_{(2(p+q))}^\mu, E_{(2p)}^\nu \right] = \sum_{\alpha, \beta, \gamma} c_{\alpha \beta}^\lambda c_{\alpha \gamma}^\mu c_{\beta \gamma}^\nu.
\]
The above sum is over all non-negative integer partitions \(\alpha, \beta, \gamma\) such that \(\ell(\alpha) \leq p,\) \(\ell(\beta) \leq q\) and \(\ell(\gamma) \leq \min(p, q)\), however, the support of the Littlewood-Richardson coefficients is contained inside the set of such \((\alpha, \beta, \gamma)\) when we choose \(p\) and \(q\) such that \(\ell(\lambda) \leq \lfloor n/2 \rfloor := p + q,\) with \(\ell(\mu) := p\) and \(\ell(\nu) := q\).

### 4.1.3. \(Sp_{2n} \subset Sp_{2n} \times Sp_{2n}\)

We consider the following see-saw pair and its complexification:
\[
Sp(n) \times Sp(n) \quad \text{ and } \quad Sp_{2n} \times Sp_{2n} = \mathfrak{so}_{2p} \oplus \mathfrak{so}_{2q}
\]
Regarding the dual pair \((Sp_{2n}, \mathfrak{so}_{2p} \oplus \mathfrak{so}_{2q})\), Theorem 3.2 gives the decomposition
\[
\mathcal{P} \left( C^{2n} \otimes C^p \otimes C^{2n} \otimes C^q \right) \cong \bigoplus \left( V_{(2n)}^\mu \otimes \tilde{V}_{(2n)}^\nu \right) \otimes \left( \tilde{V}_{(2p)}^\mu \otimes \tilde{V}_{(2q)}^\nu \right),
\]
where the sum is over non-negative integer partitions \(\mu\) and \(\nu\) such that \(\ell(\mu) \leq \min(n, p), \ell(\nu) \leq \min(n, q)\).

Regarding the dual pair \((Sp_{2n}, \mathfrak{so}_{2(p+q)})\), Theorem 3.2 gives the decomposition
\[
\mathcal{P} \left( C^{2n} \otimes C^{p+q} \right) \cong \bigoplus V_{(2n)}^\lambda \otimes \tilde{V}_{(2(p+q))}^\lambda,
\]
where the sum is over all non-negative integer partitions \(\lambda\) such that \(\ell(\lambda) \leq \min(n, p + q)\).

We assume that we are in the stable range: \(n \geq p + q\), so that as a \(GL_{p+q}\) representation (see Theorem 3.2),
\[
\tilde{V}_{(2(p+q))}^\lambda \cong S(\wedge^2 \mathbb{C}^{p+q}) \otimes F_{(p+q)}^\lambda.
\]
As a \(GL_{p} \times GL_{q}\)-representation, \(\tilde{V}_{(2(p+q))}^\lambda\) is equivalent to
\[
S(\wedge^2 \mathbb{C}^p) \otimes S(\wedge^2 \mathbb{C}^q) \otimes S(C^{p} \otimes C^{q}) \otimes F_{(p+q)}^\lambda.
\]
Note that \( n \geq p + q \) implies that \( n \geq p \) and \( n \geq q \), so that (see Theorem 3.2)
\[
\tilde{V}^\mu_{(2p)} \cong S(\wedge^2 \mathbb{C}^p) \otimes F^\mu_{(p)}
\]
and
\[
\tilde{V}^\nu_{(2q)} \cong S(\wedge^2 \mathbb{C}^q) \otimes F^\nu_{(q)}.
\]
Our see-saw pair implies (see (3.15)) that
\[
[\tilde{V}^\mu_{(2n)} \otimes \tilde{V}^\nu_{(2n)}, \tilde{V}^\lambda_{(2n)}] = \left[ \tilde{V}^\lambda_{(2(p+q))}, \tilde{V}^\mu_{(2p)} \otimes \tilde{V}^\nu_{(2q)} \right].
\]
Using the fact that we are in the stable range,

\[
[\tilde{V}^\mu_{(2(p+q))}, \tilde{V}^\nu_{(2p)} \otimes \tilde{V}^\gamma_{(2q)}] = \begin{bmatrix}
S(\wedge^2 \mathbb{C}^p) \otimes S(\wedge^2 \mathbb{C}^q) \otimes S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F^\lambda_{(p+q)} & S(\wedge^2 \mathbb{C}^p) \otimes F^\mu_{(p)} \otimes S(\wedge^2 \mathbb{C}^q) \otimes F^\nu_{(q)} \\
S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F^\lambda_{(p+q)} & F^\mu_{(p)} \otimes F^\nu_{(q)}
\end{bmatrix}.
\]
Next we will combine the decomposition
\[
F^\lambda_{(p+q)} \cong \bigoplus c_{\alpha, \beta, \gamma}^\lambda F^\alpha_{(p)} \otimes F^\beta_{(q)}
\]
with the multiplicity-free decomposition (see (3.12))
\[
S(\mathbb{C}^p \otimes \mathbb{C}^q) \cong \bigoplus F^\gamma_{(p)} \otimes F^\gamma_{(q)}
\]
to obtain the result, but first note that in the above decompositions \( \alpha, \beta, \) and \( \gamma \) range over all non-negative integer partitions such that \( \ell(\alpha) \leq p, \ell(\beta) \leq q \) and \( \ell(\gamma) \leq \min(p, q) \). So we obtain
\[
[\tilde{V}^\mu_{(2n)} \otimes V^\nu_{(2n)}, V^\lambda_{(2n)}] = \sum_{\alpha, \beta, \gamma} c_{\alpha, \beta, \gamma}^\lambda c_{\alpha}^\mu c_{\beta}^\nu c_{\gamma}^\nu,
\]
The above sum is over all non-negative integer partitions \( \alpha, \beta, \gamma \) such that \( \ell(\alpha) \leq p, \ell(\beta) \leq q \) and \( \ell(\gamma) \leq \min(p, q) \). However, the support of the Littlewood-Richardson coefficients is contained inside the set of such \( (\alpha, \beta, \gamma) \) when we choose \( p \) and \( q \) such that \( \ell(\lambda) \leq [n/2] := p + q \), with \( \ell(\mu) := p \) and \( \ell(\nu) := q \).

4.2. Proofs of the direct sum branching rules.

4.2.1. \( \text{GL}_n \times \text{GL}_m \subseteq \text{GL}_{n+m} \). We consider the following see-saw pair and its complexification:

\[
\begin{align*}
U_{n+m} \cup & \quad U_{n} \times U_{m} \\
\cup & \quad u_{p,q} \quad \text{Complexified} \\
\cup & \quad gl_{p,q} \\
\cup & \quad GL_{n+m} \cup \quad gl_{p+q} \cup \quad gl_{p+q}
\end{align*}
\]

Regarding the dual pair \( (GL_{n+m}, gl_{p+q}) \), Theorem 3.2 gives the decomposition
\[
P \left( \mathbb{C}^{n+m} \otimes \mathbb{C}^p \otimes \mathbb{C}^{n+m} \otimes \mathbb{C}^q \right) \cong \bigoplus F_{(n+m)}^{(\lambda^+, \lambda^-)} \otimes \widetilde{F}_{(p+q)}^{(\lambda^+, \lambda^-)},
\]
where the sum is over non-negative integer partitions \( \lambda^+ \) and \( \lambda^- \) such that \( \ell(\lambda^+) \leq p, \ell(\lambda^-) \leq q \) and \( \ell(\lambda^+) + \ell(\lambda^-) \leq n + m \). Regarding the dual pair \( (GL_n \times GL_m, gl_{p+q} \oplus gl_{p+q}) \), Theorem 3.2 gives the decomposition
\[
P \left( \mathbb{C}^n \otimes \mathbb{C}^p \otimes \mathbb{C}^m \otimes \mathbb{C}^p \otimes \mathbb{C}^m \otimes \mathbb{C}^q \right) \cong \bigoplus \left(F_{(n)}^{(\mu^+, \mu^-)} \otimes F_{(m)}^{(\nu^+, \nu^-)}\right) \otimes \left(\widetilde{F}_{(p+q)}^{(\mu^+, \mu^-)} \otimes \widetilde{F}_{(p+q)}^{(\nu^+, \nu^-)}\right),
\]

where the sum is over all non-negative integer partitions $\mu^+, \mu^-, \nu^+$ and $\nu^-$ such that
\[
\ell(\mu^+) + \ell(\mu^-) \leq n, \quad \ell(\nu^+) + \ell(\nu^-) \leq m,
\]
\[
\ell(\mu^+) \leq p, \quad \ell(\mu^-) \leq q,
\]
\[
\ell(\nu^+) \leq p, \quad \ell(\nu^-) \leq q.
\]
We assume that we are in the stable range: $\min(n, m) \geq p + q$, so that as a $GL_p \times GL_q$ representation (see Theorem 3.2),
\[
\overline{F}_{(p,q)}^{(\mu^+, \mu^-)} \cong S(C^p \otimes C^q) \otimes F^\mu_+(p) \otimes F^\mu_-(q),
\]
\[
\overline{F}_{(p,q)}^{(\nu^+, \nu^-)} \cong S(C^p \otimes C^q) \otimes F^\nu_+(p) \otimes F^\nu_-(q).
\]
Note that $\min(n, m) \geq p + q$ implies that $n + m \geq p + q$, so that (see Theorem 3.2)
\[
\overline{F}_{(p,q)}^{(\lambda^+, \lambda^-)} \cong S(C^p \otimes C^q) \otimes F^\lambda_+(p) \otimes F^\lambda_-(q).
\]
Our see-saw pair implies (see (3.15)) that
\[
\left[ \overline{F}_{(p,q)}^{(\mu^+, \mu^-)} \otimes \overline{F}_{(p,q)}^{(\nu^+, \nu^-)}, \overline{F}_{(p,q)}^{(\lambda^+, \lambda^-)} \right] = \left[ F_{(n+m)}^{(\mu^+, \mu^-)} \otimes F_{(n)}^{(\nu^+, \nu^-)} \right].
\]
Using the fact that we are in the stable range,
\[
\left[ \overline{F}_{(p,q)}^{(\mu^+, \mu^-)} \otimes \overline{F}_{(p,q)}^{(\nu^+, \nu^-)}, \overline{F}_{(p,q)}^{(\lambda^+, \lambda^-)} \right] = \left[ S(C^p \otimes C^q) \otimes F^\mu_+(p) \otimes F^\mu_-(q) \right] \otimes \left[ S(C^p \otimes C^q) \otimes F^\nu_+(p) \otimes F^\nu_-(q) \right] = \left[ F_{(n+m)}^{(\mu^+, \mu^-)} \otimes F_{(n)}^{(\nu^+, \nu^-)} \right].
\]
Next combine the above decomposition with (see (3.12))
\[
S(C^p \otimes C^q) \cong \bigoplus F^\delta_{(p)} \otimes F^\delta_{(q)},
\]
where the sum is over all non-negative integer partitions $\delta$ with at most $(p, q)$ parts. We then obtain
\[
\left[ \bigoplus_{\delta} F^\delta_{(p)} \otimes F^\delta_{(q)} \right] \left[ F_{(n+m)}^{(\lambda^+, \lambda^-)} \otimes F_{(n)}^{(\mu^+, \mu^-)} \otimes F_{(m)}^{(\nu^+, \nu^-)} \right] = \left[ \bigoplus_{\delta} F^\delta_{(p)} \otimes F^\delta_{(q)} \right] \left[ F_{(n+m)}^{(\lambda^+, \lambda^-)} \otimes F_{(n)}^{(\mu^+, \mu^-)} \otimes F_{(m)}^{(\nu^+, \nu^-)} \right].
\]
We combine this fact with the following two tensor product decompositions:
\[
F^\mu_+(p) \otimes F^\nu_+(q) \cong \bigoplus c^\mu_+ \nu_+ F^\gamma_+(p) \otimes F^\gamma_+(q) \quad \text{and} \quad F^\mu_-(p) \otimes F^\nu_-(q) \cong \bigoplus c^\mu_- \nu_- F^\gamma_-(q)
\]
(where $\gamma^+$ and $\gamma^-$ have at most $p$ and $q$ parts respectively), and then tensor the constituents with $F^\delta_{(p)} \otimes F^\delta_{(q)}$,
\[
F^\gamma_+(p) \otimes F^\delta_{(p)} \cong \bigoplus c^\gamma_+ \delta F^\lambda_+(p) \otimes F^\lambda_+(q) \quad \text{and} \quad F^\gamma_-(q) \otimes F^\delta_{(q)} \cong \bigoplus c^\gamma_- \delta F^\lambda_-(q)
\]
to obtain the result.
4.2.2. $O_n \times O_m \subset O_{n+m}$. We consider the following see-saw pair and its complexification:

\[
O_{n+m}(\mathbb{R}) \bigcup O_n(\mathbb{R}) \bigcap O_m(\mathbb{R}) \rightarrow \mathfrak{sp}_{2k}(\mathbb{R}) \bigcup \mathfrak{sp}_{2k}(\mathbb{R})
\]

Complexified

\[
O_{n+m} \rightarrow \mathfrak{sp}_{2k} \bigcup \mathfrak{sp}_{2k}
\]

Regarding the dual pair $(O_{n+m}, \mathfrak{sp}_{2k})$, Theorem 3.2 gives the decomposition

\[
\mathcal{P}(\mathbb{C}^{n+m} \otimes \mathbb{C}^k) \cong \bigoplus E^\lambda_{(n+m)} \otimes \tilde{E}^\lambda_{(2k)},
\]

where the sum is over non-negative integer partitions $\lambda$ such that $\ell(\lambda) \leq k$ and $(\lambda')_1 + (\lambda')_2 \leq n + m$. Regarding the dual pair $(O_n \times O_m, \mathfrak{sp}_{2k} \oplus \mathfrak{sp}_{2k})$, Theorem 3.2 gives the decomposition

\[
\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^k \otimes \mathbb{C}^m \otimes \mathbb{C}^k) \cong \bigoplus \left( E^\mu_{(n)} \otimes E^\nu_{(m)} \right) \otimes \left( \tilde{E}^\nu_{(2k)} \otimes \tilde{E}^\mu_{(2k)} \right),
\]

where the sum is over all non-negative integer partitions $\mu$ and $\nu$ such that $\ell(\mu) \leq k$, $\ell(\nu) \leq k$, $(\mu')_1 + (\mu')_2 \leq n$ and $(\nu')_1 + (\nu')_2 \leq m$.

We assume that we are in the stable range: $\min(n, m) \geq 2k$, so that as $GL_k$ representations (see Theorem 3.2),

\[
\tilde{E}^\mu_{(2k)} \cong S(S^2 \mathbb{C}^k) \otimes F^\mu_{(k)} \quad \text{and} \quad \tilde{E}^\nu_{(2k)} \cong S(S^2 \mathbb{C}^k) \otimes F^\nu_{(k)}.
\]

Note that $\min(n, m) \geq 2k$ implies that $n + m \geq 2k$, so that (see Theorem 3.2)

\[
\tilde{E}^\lambda_{(2k)} \cong S(S^2 \mathbb{C}^k) \otimes F^\lambda_{(k)}.
\]

Our see-saw pair implies (see (3.15)) that

\[
\left[ \tilde{E}^\mu_{(2k)} \otimes \tilde{E}^\nu_{(2k)}, \tilde{E}^\lambda_{(2k)} \right] = \left[ E^\mu_{(n+m)}, E^\nu_{(n)} \otimes E^\nu_{(m)} \right].
\]

Using the fact that we are in the stable range,

\[
\left[ \tilde{E}^\mu_{(2k)} \otimes \tilde{E}^\nu_{(2k)}, \tilde{E}^\lambda_{(2k)} \right] = \left[ S(S^2 \mathbb{C}^k) \otimes F^\mu_{(k)} \right] \otimes \left( S(S^2 \mathbb{C}^k) \otimes F^\nu_{(k)} \right) \otimes \left( S(S^2 \mathbb{C}^k) \otimes F^\lambda_{(k)} \right)
\]

\[
= \left[ S(S^2 \mathbb{C}^k) \otimes F^\mu_{(k)} \otimes F^\nu_{(k)}, F^\lambda_{(k)} \right].
\]

Next combine with the well-known multiplicity-free decomposition (see for instance, Theorem 3.1 of [Hay] on page 32)

\[
S(S^2 \mathbb{C}^k) \cong \bigoplus F^\delta_{(k)},
\]

where the sum is over all non-negative integer partitions $\delta$ with at most $k$ parts. We then obtain

\[
\left[ E^\lambda_{(n+m)}, E^\mu_{(n)} \otimes E^\nu_{(m)} \right] = \left[ \bigoplus F^\delta_{(k)}, F^\mu_{(k)} \otimes F^\nu_{(k)}, F^\lambda_{(k)} \right].
\]

Combine this fact with the following two tensor product decompositions:

\[
F^\mu_{(k)} \otimes F^\nu_{(k)} \cong \bigoplus c^\gamma_{\mu, \nu} F^\gamma_{(k)} \quad \text{and} \quad F^\gamma_{(k)} \otimes F^\delta_{(k)} \cong \bigoplus c^\chi_{\gamma, \delta} F^\chi_{(k)}
\]

(where $\gamma$ is a non-negative integer partition with at most $k$ parts) and the result follows.
4.2.3. \( \text{Sp}_{2n} \times \text{Sp}_{2m} \subset \text{Sp}_{2(n+m)} \). We consider the following see-saw pair and its complexification:

\[
\text{Sp}(n+m) \quad \cup \quad \text{Sp}(n) \times \text{Sp}(m) \quad \ni \quad \text{Complexified} \quad \text{Sp}_{2(n+m)} \quad \cup \quad \text{Sp}_{2n} \times \text{Sp}_{2m}
\]

Regarding the dual pair \( (\text{Sp}_{2(n+m)}, \mathfrak{so}_{2k}) \), Theorem 3.2 gives the decomposition

\[
\mathcal{P}(C^{2(n+m)} \otimes \mathbb{C}^k) \cong \bigoplus \nu (V^\mu_{(2n)} \otimes V^\nu_{(2m)}) \otimes (\bar{V}^\mu_{(2k)} \otimes \bar{V}^\nu_{(2k)}),
\]

where the sum is over non-negative integer partitions \( \lambda \) such that \( \ell(\lambda) \leq \min(n+m, k) \). Regarding the dual pair \( (\text{Sp}_{2n} \times \text{Sp}_{2m}, \mathfrak{so}_{2k} \oplus \mathfrak{so}_{2k}) \), Theorem 3.2 gives the decomposition

\[
\mathcal{P}(C^{2n} \otimes \mathbb{C}^k \otimes C^{2m} \otimes \mathbb{C}^k) \cong \bigoplus \nu (V^\mu_{(2n)} \otimes V^\nu_{(2m)}) \otimes (\bar{V}^\mu_{(2k)} \otimes \bar{V}^\nu_{(2k)}),
\]

where the sum is over all non-negative integer partitions \( \mu \) and \( \nu \) such that \( \ell(\mu) \leq \min(n, k) \), \( \ell(\nu) \leq \min(m, k) \).

We assume that we are in the stable range: \( \min(n, m) \geq k \), so that as \( GL_k \) representations (see Theorem 3.2),

\[
\bar{V}^\mu_{(2k)} \cong S(\wedge^2 \mathbb{C}^k) \otimes F^\mu_{(k)} \quad \text{and} \quad \bar{V}^\nu_{(2k)} \cong S(\wedge^2 \mathbb{C}^k) \otimes F^\nu_{(k)}.
\]

Note that \( \min(n, m) \geq k \) implies that \( n + m \geq k \), so that (see Theorem 3.2)

\[
\bar{V}^\lambda_{(2k)} \cong S(\wedge^2 \mathbb{C}^k) \otimes F^\lambda_{(k)}.
\]

Our see-saw pair implies (see (3.15)) that

\[
\left[ \bar{V}^\mu_{(2k)} \otimes \bar{V}^\nu_{(2k)}, \bar{V}^\lambda_{(2k)} \right] = \left[ V^\lambda_{(n+m)}, V^\mu_{(n)} \otimes V^\nu_{(m)} \right].
\]

Using the fact that we are in the stable range,

\[
\left[ \bar{V}^\mu_{(2k)} \otimes \bar{V}^\nu_{(2k)}, \bar{V}^\lambda_{(2k)} \right] = \left[ \left( S(\wedge^2 \mathbb{C}^k) \otimes F^\mu_{(k)} \right) \otimes \left( S(\wedge^2 \mathbb{C}^k) \otimes F^\nu_{(k)} \right), S(\wedge^2 \mathbb{C}^k) \otimes F^\lambda_{(k)} \right]
\]

\[
= \left[ S(\wedge^2 \mathbb{C}^k) \otimes F^\mu_{(k)} \otimes F^\nu_{(k)}, F^\lambda_{(k)} \right].
\]

Next combine with the well-known multiplicity-free decomposition (see for instance, Theorem 3.8.1 of [HC] on page 44)

\[
S(\wedge^2 \mathbb{C}^k) \cong \bigoplus F^{(2\delta)'}_{(k)},
\]

where the sum is over all non-negative integer partitions \( \delta \) such that \( (2\delta)' \) has at most \( k \) parts. We then obtain

\[
\left[ V^\lambda_{(2(n+m))}, V^\mu_{(2n)} \otimes V^\nu_{(2m)} \right] = \left[ \left( \bigoplus F^{(2\delta)'}_{(k)} \right) \otimes F^\mu_{(k)} \otimes F^\nu_{(k)}, F^\lambda_{(k)} \right].
\]

Combine this fact with the following two tensor product decompositions:

\[
F^\mu_{(k)} \otimes F^\nu_{(k)} \cong \bigoplus c_{\mu, \nu}^\gamma F^\gamma_{(k)} \quad \text{and} \quad F^\gamma_{(k)} \otimes F^{(2\delta)'}_{(k)} \cong \bigoplus c_{\gamma, (2\delta)'}^\lambda F^\lambda_{(k)}
\]

(where \( \gamma \) is a non-negative integer partition with at most \( k \) parts) and the result follows.
4.3. Proofs of the polarization branching rules.

4.3.1. \( \mathbf{GL}_n \subset O_{2n} \). We consider the following see-saw pair and its complexification:

\[
\begin{align*}
O_{2n}(\mathbb{R}) & \subset \mathfrak{sp}_{2k}(\mathbb{R}) \quad \text{Complexified} \quad O_{2n} & \subset \mathfrak{sp}_{2k} \\
U(n) & \subset u_{k,k} \quad U(n) & \subset GL_n \quad GL_n & \subset \mathfrak{gl}_{k,k}
\end{align*}
\]

Regarding the dual pair \((O_{2n}, \mathfrak{sp}_{2k})\), Theorem 3.2 gives the decomposition

\[
\mathcal{P}(\mathbb{C}^{2n} \otimes \mathbb{C}^k) \cong \bigoplus E_{(2n)}^\lambda \otimes \tilde{E}_{(k,k)}^\lambda,
\]

where the sum is over all non-negative integer partitions \(\lambda\) such that \(\ell(\lambda) \leq k\) and \((\lambda')_1 + (\lambda')_2 \leq 2n\). Since the standard \(O_{2n}\) representation \(\mathbb{C}^{2n} \cong \mathbb{C}^n \oplus (\mathbb{C}^n)^*\) is a \(GL_n\) representation, regarding the dual pair \((GL_n, \mathfrak{gl}_{k,k})\), Theorem 3.2 gives the decomposition

\[
\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^k \otimes (\mathbb{C}^n)^* \otimes \mathbb{C}^k) \cong \bigoplus F_{(n)}^{(\mu^+, \mu^-)} \otimes \tilde{F}_{(k,k)}^{(\mu^+, \mu^-)},
\]

where the sum is over non-negative integer partitions \(\mu^+\) and \(\mu^-\) with at most \(k\) parts such that \(\ell(\mu^+) + \ell(\mu^-) \leq n\).

We assume that we are in the stable range: \(n \geq 2k\), so that as a \(GL_k \times GL_k\) representation (see Theorem 3.2),

\[
\tilde{F}_{(k,k)}^{(\mu^+, \mu^-)} \cong S(\mathbb{C}^k \otimes \mathbb{C}^k) \otimes F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-}.
\]

Note that \(n \geq 2k\) implies that \(n \geq k\), so that as \(GL_k\) representations (see Theorem 3.2)

\[
\tilde{E}_{(2k)}^\lambda \cong S(\mathbb{C}^k \otimes \mathbb{C}^k) \otimes F_{(k)}^{\lambda}.
\]

Our see-saw pair implies (see (3.15)) that

\[
\begin{bmatrix}
\tilde{F}_{(k,k)}^{(\mu^+, \mu^-)}, \tilde{E}_{(2k)}^\lambda
\end{bmatrix} = \begin{bmatrix}
E_{(2n)}^\lambda, F_{(n)}^{(\mu^+, \mu^-)}
\end{bmatrix}.
\]

Using the fact that we are in the stable range,

\[
\begin{bmatrix}
\tilde{F}_{(k,k)}^{(\mu^+, \mu^-)}, \tilde{E}_{(2k)}^\lambda
\end{bmatrix} = \begin{bmatrix}
S(\mathbb{C}^k \otimes \mathbb{C}^k) \otimes F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-}, S(\mathbb{C}^k \otimes \mathbb{C}^k) \otimes F_{(k)}^{\lambda} \\
S(\mathbb{C}^k \otimes \mathbb{C}^k) \otimes F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-}, S(\mathbb{C}^k \otimes \mathbb{C}^k) \otimes F_{(k)}^{\lambda}
\end{bmatrix}.
\]

Note that in the above we used the fact that as a \(GL_k\)-representation, \(\otimes^2 \mathbb{C}^k \cong S^2 \mathbb{C}^k \oplus \wedge^2 \mathbb{C}^k\).

Next combine with the well-known multiplicity-free decomposition

\[
S(\otimes \mathbb{C}^k) \cong \bigoplus F_{(k)}^{(2\delta)'},
\]

where the sum is over all non-negative integer partitions \(\delta\) such that \((2\delta)'\) has at most \(k\) parts. We then obtain

\[
\begin{bmatrix}
E_{(2n)}^\lambda, F_{(n)}^{(\mu^+, \mu^-)}
\end{bmatrix} = \begin{bmatrix}
\bigoplus_{\delta} F_{(k)}^{(2\delta)'} \otimes F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-}, F_{(k)}^{\lambda}
\end{bmatrix}.
\]

Combine this fact with the following two tensor product decompositions:

\[
F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-} \cong \bigoplus E_{\mu^+ \mu^-}^\gamma F_{(k)}^\gamma \quad \text{and} \quad F_{(k)}^\gamma \otimes F_{(k)}^{(2\delta)'} \cong \bigoplus E_{\gamma}^{(2\delta)'} F_{(k)}^\gamma.
\]
(where \( \gamma \) is a non-negative integer partition with at most \( k \) parts) and the result follows.

4.3.2. \( \text{GL}_n \subset \text{Sp}_{2n} \). We consider the following see-saw pair and its complexification:

\[
\begin{align*}
\text{Sp}(n) & \rightarrow \mathfrak{so}_{2k}^n \quad \text{Complexified} \\
\cup & \quad \cap \quad \sim \quad \cup & \quad \cap \\
\text{U}(n) & \rightarrow \mathfrak{u}_{k,k} \\
& \text{GL}_n - \mathfrak{gl}_{k,k}
\end{align*}
\]

Regarding the dual pair \((\text{Sp}_{2n}, \mathfrak{so}_{2k})\), Theorem 3.2 gives the decomposition

\[
\mathcal{P}(\mathbb{C}^{2n} \otimes \mathbb{C}^k) \cong \bigoplus V_{(2n)}^\lambda \otimes \tilde{V}_{(2k)}^\lambda,
\]

where the sum is over all non-negative integer partitions \( \lambda \) such that \( \ell(\lambda) \leq \min(n, k) \). Since the standard \( \text{Sp}_{2n} \) representation \( \mathbb{C}^{2n} \cong \mathbb{C}^n \oplus (\mathbb{C}^n)^* \) is a \( \text{GL}_n \) representation, regarding the dual pair \((\text{GL}_n, \mathfrak{gl}_{k,k})\), Theorem 3.2 gives the decomposition

\[
\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^k \otimes (\mathbb{C}^n)^* \otimes \mathbb{C}^k) \cong \bigoplus F_{(n)}^{(\mu^+, \mu^-)} \otimes F_{(k,k)}^{(\mu^+, \mu^-)},
\]

where the sum is over non-negative integer partitions \( \mu^+ \) and \( \mu^- \) with at most \( k \) parts such that \( \ell(\mu^+) + \ell(\mu^-) \leq n \).

We assume that we are in the stable range: \( n \geq 2k \), so that as \( \text{GL}_k \times \text{GL}_k \) representations (see Theorem 3.2),

\[
\tilde{F}_{(k,k)}^{(\mu^+, \mu^-)} \cong S(\mathbb{C}^k \otimes \mathbb{C}^k) \otimes F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-}.
\]

Note that \( n \geq 2k \) implies that \( n \geq k \), so that as a \( \text{GL}_k \) representation (see Theorem 3.2),

\[
\tilde{V}_{(2k)}^\lambda \cong S(\wedge^2 \mathbb{C}^k) \otimes F_{(k)}^\lambda.
\]

Our see-saw pair implies (see (3.15)) that

\[
\begin{bmatrix}
F_{(k,k)}^{(\mu^+, \mu^-)}, \tilde{V}_{(2k)}^\lambda \\
\end{bmatrix} = \begin{bmatrix}
V_{(2n)}^\lambda, F_{(n)}^{(\mu^+, \mu^-)} \\
\end{bmatrix}.
\]

Using the fact that we are in the stable range,

\[
\begin{bmatrix}
F_{(k,k)}^{(\mu^+, \mu^-)}, \tilde{V}_{(2k)}^\lambda \\
\end{bmatrix} = \begin{bmatrix}
S(\mathbb{C}^k \otimes \mathbb{C}^k) \otimes F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-}, S(\wedge^2 \mathbb{C}^k) \otimes F_{(k)}^\lambda \\
\end{bmatrix} = \begin{bmatrix}
S(\bigotimes^2 \mathbb{C}^k) \otimes F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-}, F_{(k)}^\lambda \\
\end{bmatrix}.
\]

Note that in the above we used the fact that as a \( \text{GL}_k \)-representation, \( \bigotimes^2 \mathbb{C}^k \cong S^2 \mathbb{C}^k \oplus \wedge^2 \mathbb{C}^k \).

Next combine with the well-known multiplicity-free decomposition

\[
S(\bigotimes^2 \mathbb{C}^k) \cong \bigoplus F_{(k)}^{\delta},
\]

where the sum is over all non-negative integer partitions \( \delta \) with at most \( k \) parts.

We then obtain

\[
\begin{bmatrix}
V_{(2n)}^\lambda, F_{(n)}^{(\mu^+, \mu^-)} \\
\end{bmatrix} = \begin{bmatrix}
\bigoplus F_{(k)}^{\delta} \otimes F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-} \\
\end{bmatrix}.
\]

Combine this fact with the following two tensor product decompositions:

\[
F_{(k)}^{\mu^+} \otimes F_{(k)}^{\mu^-} \cong \bigoplus c_{\mu^+ \mu^-}^\gamma F_{(k)}^{\gamma} \quad \text{and} \quad F_{(k)}^{\gamma} \otimes F_{(k)}^{\delta} \cong \bigoplus c_{\gamma \delta}^\lambda F_{(k)}^\lambda
\]
(where $\gamma$ is a non-negative integer partition with at most $k$ parts) and the result follows.

4.4. **Proofs of the bilinear form branching rules.**

4.4.1. $O_n \subset \mathfrak{gl}_n$. We consider the following see-saw pair and its complexification:

\[
GL_n(\mathbb{R}) \cup \mathfrak{sp}(2(p+q)) \rightarrow \bigcup \mathfrak{gl}_{p,q} \cap O_n(\mathbb{R}) \rightarrow \bigcap \mathfrak{sp}_{2(p+q)}
\]

Regarding the dual pair $(GL_n, \mathfrak{gl}_{p,q})$, Theorem 3.2 gives the decomposition

\[
\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^p \otimes (\mathbb{C}^n)^* \otimes \mathbb{C}^q) \cong \bigoplus F^{(\lambda^+,\lambda^-)}_{(n)} \otimes \tilde{F}^{(\lambda^+,\lambda^-)}_{(2(p+q))},
\]

where the sum is over non-negative integer partitions $\lambda^+$ and $\lambda^-$ with at most $p$ and $q$ parts, respectively, and such that $\ell(\lambda^+) + \ell(\lambda^-) \leq n$. Noting that $\mathbb{C}^n \cong (\mathbb{C}^n)^*$ is an $O_n$ representation, regarding the dual pair $(O_n, \mathfrak{sp}_{2(p+q)})$, Theorem 3.2 gives the decomposition

\[
\mathcal{P}(\mathbb{C}^n \otimes \mathbb{C}^{p+q}) \cong \bigoplus E^\lambda_{(n)} \otimes \tilde{E}^\lambda_{(2(p+q))},
\]

where the sum is over all non-negative integer partitions $\lambda$ such that $\ell(\lambda) \leq p + q$ and $(\lambda'_1 + \lambda'_2) \leq n$.

We assume that we are in the stable range: $n \geq 2(p+q)$, so that as $GL_{p+q}$ representations (see Theorem 3.2),

\[
\tilde{E}^\mu_{(2(p+q))} \cong S(S^2\mathbb{C}^{p+q}) \otimes F^\mu_{(p+q)}.
\]

Note that $n \geq 2(p+q)$ implies that $n \geq p+q$, so that as $GL_p \times GL_q$ representations (see Theorem 3.2),

\[
\tilde{F}^{(\lambda^+,\lambda^-)}_{(p,q)} \cong S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F^\lambda_{(p)} \otimes F^\lambda_{(q)}.
\]

Our see-saw pair implies (see (3.15) that

\[
\left[ E^\mu_{(2(p+q))}, \tilde{F}^{(\lambda^+,\lambda^-)}_{(p,q)} \right] = \left[ F^{(\lambda^+,\lambda^-)}_{(n)}, E^\mu_{(n)} \right].
\]

Using the fact that we are in the stable range,

\[
\left[ \tilde{E}^\mu_{(2(p+q))}, \tilde{F}^{(\lambda^+,\lambda^-)}_{(p,q)} \right] = \left[ S(S^2\mathbb{C}^{p+q}) \otimes F^\mu_{(p+q)}, S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F^\lambda_{(p)} \otimes F^\lambda_{(q)} \right]
\]

\[
= \left[ S(S^2\mathbb{C}^p \otimes S^2\mathbb{C}^q \otimes \mathbb{C}^p \otimes \mathbb{C}^q) \otimes F^\mu_{(p+q)}, S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F^\lambda_{(p)} \otimes F^\lambda_{(q)} \right]
\]

Next we combine the decompositions

\[
F^\mu_{(p+q)} \cong \bigoplus c_{\alpha \beta} F^\mu_{(p)} \otimes F^\nu_{(q)}
\]

with the multiplicity-free decompositions

\[
S(S^2\mathbb{C}^p) \cong \bigoplus F^{2\gamma}_{(p)} \quad \text{and} \quad S(S^2\mathbb{C}^q) \cong \bigoplus F^{2\delta}_{(q)},
\]
where the sums are over all non-negative integer partitions \( \gamma \) and \( \delta \) with at most \( p \) and \( q \) parts respectively. We then obtain
\[
[F_{(n)}^{(\lambda^+, \lambda^-)}, F_{(n)}^{\gamma}] = \left[ \bigoplus F_{(p)}^{\mu} \otimes \left( \bigoplus F_{(q)}^{\delta} \otimes \left( \bigoplus c_{\alpha \beta}^{\mu} F_{(p)}^{\alpha} \otimes F_{(q)}^{\beta} \right) \right), F_{(p)}^{\lambda^+} \otimes F_{(q)}^{\lambda^-} \right].
\]
Combine this fact with the following two tensor product decompositions:
\[
F_{(p)}^{\alpha} \otimes F_{(p)}^{2\gamma} \cong \bigoplus \alpha \beta \gamma^{2\delta} F_{(p)}^{\lambda^+} \quad \text{and} \quad F_{(q)}^{\beta} \otimes F_{(q)}^{2\delta} \cong \bigoplus \gamma \beta \gamma^{2\epsilon} F_{(q)}^{\lambda^-},
\]
and the result follows.

4.4.2. \( \text{Sp}_{2n} \subset \text{GL}_{2n} \). We consider the following see-saw pair and its complexification:
\[
U_{2n} - \mathfrak{u}_{p,q} \quad \text{Complexified} \quad GL_{2n} - \mathfrak{gl}_{p,q}
\]
\[
\text{Sp}(n) - \mathfrak{so}_{2(n+p+q)} \quad \text{Sp}_{2n} - \mathfrak{so}_{2(p+q)}
\]
Regarding the dual pair \((\text{GL}_{2n}, \mathfrak{gl}_{p,q})\), Theorem 3.2 gives the decomposition
\[
\mathcal{P} \left( \mathbb{C}^{2n} \otimes \mathbb{C}^p \otimes (\mathbb{C}^{2n})^* \otimes \mathbb{C}^q \right) \cong \bigoplus F_{(2n)}^{(\lambda^+, \lambda^-)} \otimes \tilde{F}_{(p,q)}^{(\lambda^+, \lambda^-)},
\]
where the sum is over all non-negative integer partitions \( \lambda^+ \) and \( \lambda^- \) with at most \( p \) and \( q \) parts, respectively, and such that \( \ell(\lambda^+) + \ell(\lambda^-) \leq 2n \). Noting that \((\mathbb{C}^{2n})^* \simeq \mathbb{C}^{2n}\) as \( \text{Sp}_{2n} \) modules, regarding the dual pair \((\text{Sp}_{2n}, \mathfrak{so}_{2(p+q)})\), Theorem 3.2 gives the decomposition
\[
\mathcal{P} \left( \mathbb{C}^{2n} \otimes \mathbb{C}^{p+q} \right) \cong \bigoplus V_{(2n)}^{\lambda} \otimes \tilde{V}_{(p+q)}^{\lambda},
\]
where the sum is over all non-negative integer partitions \( \lambda \) such that \( \ell(\lambda) \leq \min(2n, p+q) \).

We assume that we are in the stable range: \( n \geq p + q \), so that as \( \text{GL}_{p+q} \) representations (see Theorem 3.2)
\[
\tilde{V}_{(2(p+q))}^{\mu} \cong S(\mathbb{C}^{p+q}) \otimes F_{(p+q)}^{\mu}.
\]
Note that \( n \geq p + q \) implies that \( 2n \geq p + q \), so that as \( \text{GL}_p \times \text{GL}_q \) representations (see Theorem 3.2),
\[
\tilde{F}_{(p,q)}^{(\lambda^+, \lambda^-)} \cong S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F_{(p)}^{\lambda^+} \otimes F_{(q)}^{\lambda^-}.
\]
Our see-saw pair implies (see (3.15)) that
\[
\left[ \tilde{V}_{(2(p+q))}^{\mu} \right]^{(\lambda^+, \lambda^-)} = \left[ F_{(2n)}^{(\lambda^+, \lambda^-)}, V_{(2n)}^{\mu} \right].
\]
Using the fact that we are in the stable range,
\[
\left[ \tilde{V}_{(2(p+q))}^{\mu} \right]^{(\lambda^+, \lambda^-)} = \left[ S(\mathbb{C}^{p+q}) \otimes F_{(p+q)}^{\mu}, S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F_{(p)}^{\lambda^+} \otimes F_{(q)}^{\lambda^-} \right]
\]
\[
= \left[ S(\mathbb{C}^p \otimes \mathbb{C}^q \otimes \mathbb{C}^p \otimes \mathbb{C}^q) \otimes F_{(p+q)}^{\mu}, S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F_{(p)}^{\lambda^+} \otimes F_{(q)}^{\lambda^-} \right]
\]
\[
= \left[ S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes S(\mathbb{C}^p \otimes \mathbb{C}^q) \otimes F_{(p+q)}^{\mu} \otimes F_{(p)}^{\lambda^+} \otimes F_{(q)}^{\lambda^-} \right].
\]
Next we combine the decompositions
\[
F_{(p+q)}^{\mu} \cong \bigoplus c_{\alpha \beta}^{\mu} F_{(p)}^{\alpha} \otimes F_{(q)}^{\beta}.
\]
with the multiplicity-free decompositions
\[ S(\wedge^2 C^p) \cong \bigoplus F^{(2\gamma)'}_{(p)} \quad \text{and} \quad S(\wedge^2 C^q) \cong \bigoplus F^{(2\delta)'}_{(q)} \]
where the sums are over all non-negative integer partitions \( \gamma \) and \( \delta \) such that \( (2\gamma)' \) and \( (2\delta)' \) have at most \( p \) and \( q \) parts, respectively. We then obtain
\[ \left[ F^{(\lambda_+, \lambda_-)}_{(2\alpha)}, V^{(\mu)}_{(2\alpha)} \right] = \left( \bigoplus c^{\lambda, \gamma}_{(p)} F^{(\gamma)'}_{(p)} \otimes F^{\lambda_+}_{(p)} \right) \otimes \left( \bigoplus c^{\lambda, \delta}_{(q)} F^{(\delta)'}_{(q)} \otimes F^{\lambda_-}_{(q)} \right). \]
Combine with the following two tensor product decompositions:
\[ F^{(\alpha)}_{(p)} \otimes F^{(2\gamma)'}_{(p)} \cong \bigoplus c^{\lambda, \gamma}_{(p)} F^{\lambda_+}_{(p)} \quad \text{and} \quad F^{(\beta)}_{(q)} \otimes F^{(2\delta)'}_{(q)} \cong \bigoplus c^{\lambda, \delta}_{(q)} F^{\lambda_-}_{(q)}, \]
and the result follows.

Acknowledgement

We are grateful to the referee for his elaborate and in-depth comments. Most notably, for the vast number of references and comments on related works for branching rules and tensor products of infinite-dimensional representations.
