SHARP MORREY-SOBOLEV INEQUALITIES
AND THE DISTANCE FROM EXTREMALS

ANDREA CIANCHI

Abstract. Quantitative versions of sharp estimates for the supremum of Sobolev functions in \( W^{1,p}(\mathbb{R}^n) \), \( p > n \), with remainder terms depending on the distance from the families of extremals, are established.

1. Introduction and results

The present paper is concerned with the Morrey-Sobolev embedding theorem stating that any weakly differentiable function \( u \) in \( \mathbb{R}^n \), \( n \geq 2 \), with \( |\nabla u| \in L^p(\mathbb{R}^n) \) for some \( p > n \), and decaying to 0 at infinity, is essentially bounded (and, in fact, locally Hölder continuous) in \( \mathbb{R}^n \) (see e.g. [Ad, M2, Z]). A special form of such an embedding tells us that

\[
\|u\|_{L^{\infty}(\mathbb{R}^n)} \leq C_{1}(p, n) \mathcal{L}^n(\text{sprt} u)^{\frac{1}{n}} \|\nabla u\|_{L^p(\mathbb{R}^n)}
\]

for every \( u \) as above fulfilling (1.1) (see e.g. [T2, Theorem 2E]). Here,

\[
C_{1}(p, n) = n^{-1/p} \omega_n^{-1/n} \left( \frac{p-1}{p-n} \right)^{1/p'},
\]

where \( \mathcal{L}^n \) denotes the Lebesgue measure in \( \mathbb{R}^n \), \( \text{sprt} u \) stands for \( \{x \in \mathbb{R}^n : |u(x)| > 0\} \), and \( \|\nabla u\|_{L^p(\mathbb{R}^n)} \) denotes the \( L^p(\mathbb{R}^n) \) norm of the length of the gradient \( \nabla u \).

In particular, an optimal version of the relevant estimate yields

\[
\|u\|_{L^{\infty}(\mathbb{R}^n)} \leq C_{1}(p, n) \mathcal{L}^n(\text{sprt} u)^{\frac{1}{n}} \|\nabla u\|_{L^p(\mathbb{R}^n)}
\]

for every \( u \) as above fulfilling (1.1) (see e.g. [T2, Theorem 2E]). Here,

\[
C_{1}(p, n) = n^{-1/p} \omega_n^{-1/n} \left( \frac{p-1}{p-n} \right)^{1/p'},
\]

where \( \omega_n = \pi^{n/2}/\Gamma(1+n/2) \), the measure of the unit ball in \( \mathbb{R}^n \), and \( p' = \frac{p}{p-1} \), the Hölder conjugate of \( p \). The constant \( C_{1}(p, n) \) in (1.2) is the best possible, since equality holds whenever \( u \) agrees with any of the functions \( v_{a,b,x_0} : \mathbb{R}^n \to [0, +\infty) \) given by

\[
v_{a,b,x_0}(x) = \begin{cases} 
  a \left( b^{\frac{p-n}{p-1}} - |x-x_0|^{\frac{p-n}{p-1}} \right) & \text{if } |x-x_0| \leq b, \\
  0 & \text{otherwise},
\end{cases}
\]

for some \( a \in \mathbb{R} \), \( b \geq 0 \) and \( x_0 \in \mathbb{R}^n \).

When assumption (1.1) is dropped, bounds for \( \|u\|_{L^{\infty}(\mathbb{R}^n)} \) by \( \|\nabla u\|_{L^p(\mathbb{R}^n)} \) are possible only in conjunction with some other norm \( \|u\|_{L^q(\mathbb{R}^n)} \), with \( q \in [1, \infty) \).
Theorem 1.1. Let $p > n$. Then there exist positive constants $\alpha$ and $C_3$, depending only on $p$ and $n$, such that
\begin{equation}
\|u\|_{L^\infty(\mathbb{R}^n)} \leq C_3 \left( \inf_{a,b,x_0} \frac{\|u - u_{a,b,x_0}\|_{L^\infty(\mathbb{R}^n)}}{\|u\|_{L^\infty(\mathbb{R}^n)}} \right)^\alpha
\end{equation}
for every weakly differentiable function $u \in L^\infty(\mathbb{R}^n)$ satisfying (1.1) and such that $|\nabla u| \in L^p(\mathbb{R}^n)$. Here, the infimum is extended over all $a \in \mathbb{R}$, $b \geq 0$ and $x_0 \in \mathbb{R}^n$, and is understood to agree with 0 if $u \equiv 0$.

The counterpart of Theorem 1.1 for inequality (1.5) is contained in the next statement.

Theorem 1.2. Let $p > n$. Then there exist positive constants $\beta$ and $C_4$, depending only on $p$ and $n$, such that
\begin{equation}
\|u\|_{L^\infty(\mathbb{R}^n)} \leq C_4 \left( \inf_{a,b,x_0} \frac{\|u - u_{a,b,x_0}\|_{L^\infty(\mathbb{R}^n)}}{\|u\|_{L^\infty(\mathbb{R}^n)}} \right)^\beta
\end{equation}
for every weakly differentiable function $u \in L^\infty(\mathbb{R}^n)$ satisfying (1.5) and such that $|\nabla u| \in L^p(\mathbb{R}^n)$. Here, the infimum is extended over all $a \in \mathbb{R}$, $b \geq 0$ and $x_0 \in \mathbb{R}^n$, and is understood to agree with 0 if $u \equiv 0$.
for every weakly differentiable function \( u \in L^1(\mathbb{R}^n) \) such that \( |\nabla u| \in L^p(\mathbb{R}^n) \). Here, the infimum is defined similarly as in Theorem \ref{thm:1.1}.

The remaining part of the paper is devoted to the proofs of Theorems \ref{thm:1.1} and \ref{thm:1.2} which will be accomplished in Sections 2 and 3 respectively. Let us just recall that Sobolev type inequalities, with optimal constants, are known for \( p \in [1, n) \) as well (and are probably even more popular than \ref{thm:1.2} and \ref{thm:1.4}), and go back to \cite{BB} and \cite{CFMP} in the case when \( 1 < p < n \). Sharp Sobolev and related inequalities involving remainder terms have been the object of a quite rich literature in the last few decades, including \cite{BFT, BWW, BL, BN, DHA, FMT, GGS}. In particular, our recent paper \cite{C} deals with an inequality estimating the distance from extremals, in the spirit of Theorems \ref{thm:1.1} and \ref{thm:1.2}, but in the opposite endpoint situation, having a geometric character, where \( p = 1 \). As far as intermediate values of \( p \in (1, n) \) are concerned, a quantitative form of the optimal Sobolev inequality for \( p = 2 \) was established in \cite{BE} by Hilbert spaces and PDE’s techniques; the general case requires methods different from those of \cite{BE, C} and of this paper, and is the object of \cite{CFMP}.

2. Proof of Theorem \ref{thm:1.1}

Our approach to Theorem \ref{thm:1.1} consists of two steps. First, inequality \ref{eq:1.9} is established for spherically symmetric functions. Second, the (normalized) distance in \( L^\infty(\mathbb{R}^n) \) of any \( u \) from a suitable translate of its Schwarz symetral \( u^* \) is estimated in terms of the gap between the two sides of \ref{eq:1.2}. Recall that, given any measurable function \( u : \mathbb{R}^n \to \mathbb{R} \) satisfying

\[
\mathcal{L}^n(\{|u| > t\}) < +\infty \quad \text{for every } t > 0,
\]

its decreasing rearrangement \( u^* : [0, +\infty) \to [0, +\infty] \) is defined by

\[
u^*(s) = \sup\{t \geq 0 : \mathcal{L}^n(\{|u| > t\}) > s\} \quad \text{for } s \in [0, +\infty),
\]

and its Schwarz symetral \( u^* : \mathbb{R}^n \to [0, +\infty] \) by

\[
u^*(x) = u^*(\omega_n |x|^n) \quad \text{for } x \in \mathbb{R}^n.
\]

The above definitions entail that

\[
\mathcal{L}^n(\{|u^* > t\}) = \mathcal{L}^1(\{|u^* > t\}) = \mathcal{L}^n(\{|u| > t\}) \quad \text{for } t > 0,
\]

whence

\[
\|u^*\|_{L^q(\mathbb{R}^n)} = \|u^*\|_{L^q(0,\infty)} = \|u\|_{L^q(\mathbb{R}^n)} \quad \text{for every } q \in [1, \infty).
\]

A much deeper property is provided by the Pólya-Szegö principle, which tells us that if \( u \) fulfills \ref{eq:2.1}, is weakly differentiable in \( \mathbb{R}^n \) and \( |\nabla u| \in L^p(\mathbb{R}^n) \) for some \( p \in [1, \infty] \), then \( u^* \) is locally absolutely continuous in \( (0, +\infty) \), \( u^* \) is weakly differentiable in \( \mathbb{R}^n \), and

\[
\|\nabla u^*\|_{L^p(\mathbb{R}^n)} \leq \|\nabla u\|_{L^p(\mathbb{R}^n)}
\]

(see e.g. \cite{BZ, H, K, S, T1}). Moreover, since

\[
|\nabla u^*(x)| = n\omega_n^{1/n}s^{1/n'}(-u''(s)) \quad \text{for a.e. } x \in \mathbb{R}^n,
\]

where \( s = \omega_n |x|^n \), one has

\[
\|\nabla u^*\|_{L^p(\mathbb{R}^n)} = \|n\omega_n^{1/n}s^{1/n'}(-u''(s))\|_{L^p(0,\infty)}.
\]
Our discussion of inequality (1.9) for spherically symmetric functions is inspired by the approach of [12], and requires the following quantitative version of Hölder’s inequality.

**Lemma 2.1.** Let $(X, m)$ be a (positive) measure space, and let $p \geq 2$. Assume that $f \in L^p(X, m)$ and $g \in L^{p'}(X, m)$, and set

$$\vartheta = \left( \frac{\int_X |g|^p dm}{\int_X |f|^p dm} \right)^{\frac{1}{p'}}. \quad (2.8)$$

Then

$$\int_X |fg| dm + \frac{1}{p} \int_X |\vartheta f - (g/\vartheta)|^{p'} dm \leq \|f\|_{L^p} \|g\|_{L^{p'}}. \quad (2.9)$$

**Proof.** One has

$$rs + \frac{1}{p} |r - s|^{p'} \leq \frac{r^p}{p} + \frac{s^{p'}}{p'} \quad \text{for every } r, s \geq 0.$$

Applying this inequality with $r = \vartheta f$ and $s = g/\vartheta$ and integrating over $X$ yield (2.9). \qed

A key tool in the second step of our proof, dealing with the distance between $u$ and (a suitable translate of) $u^\bullet$, is a quantitative form of inequality (2.5), recently proved in [CEFT, Theorem 4.1] (see also [CF] for the one-dimensional case), which reads as follows. Let $n \geq 1$ and let $p > 1$. Given any weakly differentiable function $u$ satisfying (1.1) and such that $|\nabla u| \in L^p(\mathbb{R}^n)$, define

$$E(u) = \frac{\int_{\mathbb{R}^n} |\nabla u|^p dx}{\int_{\mathbb{R}^n} |u^\bullet|^p dx} - 1,$$

and

$$\int |\nabla u^\bullet|^p dx = \frac{1}{\mathcal{L}^n(\text{sprt } u)} \int_{\mathbb{R}^n} |\nabla u^\bullet|^p dx$$

and

$$M_{u^\bullet}(\sigma) = \frac{\mathcal{L}^n(\{ |\nabla u^\bullet| \leq \sigma \} \cap \{ 0 < u^\bullet < \text{esssup } |u| \})}{\mathcal{L}^n(\text{sprt } u)} \quad \text{for } \sigma > 0.$$  

Then there exist positive constants $r_1$, $r_2$, $r_3$ and $C$, depending only on $p$ and $n$, such that

$$\min_{x_0 \in \mathbb{R}^n} \|u(\cdot) \pm u^\bullet(\cdot - x_0)\|_{L^1(\mathbb{R}^n)} \leq C \left( \int |\nabla u^\bullet|^p dx \right)^{1/p} \mathcal{L}^n(\text{sprt } u)^{1 + \frac{1}{p}} \left[ M_{u^\bullet}(\sigma) + E(u)^{r_1} + \left( \frac{\int |\nabla u^\bullet|^p dx}{\sigma} \right)^{1/p} E(u)^{r_2} \right]^{r_3} \quad (2.10)$$

for every $\sigma > 0$. Notice that, in particular, the exponents $r_1$, $r_2$ and $r_3$ in (2.10) can be chosen arbitrarily small.

**Proof of Theorem 1.1** Assume, for the time being, that

$$\mathcal{L}^n(\text{sprt } u) = 1 \quad (2.11)$$

and

$$\|u\|_{L^\infty(\mathbb{R}^n)} = 1. \quad (2.12)$$
Set
\[ \epsilon = C_1(p, n)^p \| \nabla u \|_{L^p(\mathbb{R}^n)}^p - 1. \] (2.13)

Owing to (2.5), (2.4) and (1.2),
\[ 0 \leq \| \nabla u \|_{L^p(\mathbb{R}^n)}^p - \| \nabla u \|_{L^p(\mathbb{R}^n)}^p \leq \frac{\epsilon}{C_1(p, n)^p} \]
(2.14)
and
\[ 0 \leq C_1(p, n) \| \nabla u \|_{L^p(\mathbb{R}^n)} - 1 \leq C_1(p, n)^p \| \nabla \star \|_{L^p(\mathbb{R}^n)} - 1 \leq \epsilon. \] (2.15)

Inequality (2.14) will be used to estimate \( \min \max \inf \| u(\cdot) \pm \star(\cdot - x_0) \|_{L^\infty(\mathbb{R}^n)}, \)
whereas (2.15) will provide an estimate for \( \inf_{a,b} \| \star(\cdot - x_0) - v_{a,b,x_0}(\cdot) \|_{L^\infty(\mathbb{R}^n)}. \)
These estimates will immediately lead to (1.9).

Consider the latter first. Define
\[ \lambda = C_1(p, n)^\frac{1}{p} \left( \int_0^1 (n\omega_n^{1/n} s^{1/n'} (-u^{s'}(s)))^p ds \right)^{1/p'}, \]
(2.16)
and
\[ \Lambda = n\omega_n^{1/n} \lambda. \] (2.17)

Equations (2.4) and (2.12), an application of Lemma 2.1 and (2.7) tell us that
\[ 1 = u^*(0) = \int_0^1 (-u^{s'}(s)) ds \]
(2.18)
\[ \leq \frac{1}{n\omega_n^{1/n}} \left( \int_0^1 (n\omega_n^{1/n} s^{1/n'} (-u^{s'}(s)))^p ds \right)^{1/p} \left( \int_0^1 s^{p'/n'} ds \right)^{1/p'} - \frac{1}{p} \int_0^1 |\Lambda s^{1/n'} (-u^{s'}(s)) - (s^{-1/n'/\Lambda})^{1/(p-1)}|^p ds \]
\[ = C_1(p, n) \| \nabla \star \|_{L^p(\mathbb{R}^n)} - 1 - \frac{1}{p} \int_0^1 |\Lambda s^{1/n'} (-u^{s'}(s)) - (s^{-1/n'}/\Lambda)^{1/(p-1)}|^p ds. \]

Coupling (2.15) and (2.18) yields
\[ \int_0^1 |\Lambda s^{1/n'} (-u^{s'}(s)) - (s^{-1/n'}/\Lambda)^{1/(p-1)}|^p ds \leq pe. \] (2.19)

Now, define \( \phi : [0, 1] \to [0, \infty) \) as
\[ \phi(s) = \frac{1 - s^{-1/p'/n'}}{\Lambda s^{1/p'/n'}(1 - p'/n')} \quad \text{for } s \in [0, 1]. \]
Then,
\[ \phi(\omega_n x^n) = v_{a,b,x_0}(x) \quad \text{if } \omega_n x^n \leq 1, \]
provided that \( a \) and \( b \) are suitably chosen. Since \( u^*(1) = \phi(1) = 0, \)
(2.20)
\[ \| u^* - \phi \|_{L^\infty((0,1))} \leq \int_0^1 |u^{s'}(s) - \phi(s)| ds \]
\[ \leq \left( \int_0^1 |s^{1/n'}(-u^{s'}(s)) - s^{-1/(n'(p-1)}\Lambda s^{p-1/n'}|^p ds \right)^{1/p} \left( \int_0^1 s^{p'/n'} ds \right)^{1/p}. \]
Hence, by (2.19) and (2.17),

\[
(2.21) \quad \|u^* - \phi\|_{L^\infty(0,1)} \leq C_5 \epsilon^{\frac{1}{p}} \left( \int_0^1 (n\omega_n^{1/n} s^{1/n'} (-u^*(s)))^p \, ds \right)^{\frac{1}{p}}
\]

for some constant $C_5$, depending only on $p$ and $n$. Owing to (2.7) and (2.15), inequality (2.21) entails that, for every $x_0 \in \mathbb{R}^n$,

\[
(2.22) \quad \inf_{a,b} \|u^*(\cdot - x_0) - v_{a,b,x_0}(\cdot)\|_{L^\infty(\mathbb{R}^n)} \leq C_5 \epsilon^{\frac{1}{p}} ((1 + \epsilon)/C_1(p,n))^{\frac{1}{p'}}.
\]

When $\epsilon \leq 1$, inequality (2.22) yields

\[
\inf_{a,b} \|u^*(\cdot - x_0) - v_{a,b,x_0}(\cdot)\|_{L^\infty(\mathbb{R}^n)} \leq C_5 \epsilon^{\frac{1}{p}} (2/C_1(p,n))^{\frac{1}{p'}}
\]

for every $x_0 \in \mathbb{R}^n$. On the other hand, if $\epsilon > 1$, then trivially

\[
\inf_{a,b} \|u^*(\cdot - x_0) - v_{a,b,x_0}(\cdot)\|_{L^\infty(\mathbb{R}^n)} \leq \|u^*\|_{L^\infty(\mathbb{R}^n)} = 1 \leq \epsilon^{\frac{1}{p'}}
\]

for every $x_0 \in \mathbb{R}^n$. Thus, there exists a constant $C_6$, depending only on $p$ and $n$, such that, under (2.11) and (2.12),

\[
(2.23) \quad \inf_{a,b} \|u^*(\cdot - x_0) - v_{a,b,x_0}(\cdot)\|_{L^\infty(\mathbb{R}^n)} \leq C_6 \epsilon^{\frac{1}{p}}
\]

for every $x_0 \in \mathbb{R}^n$.

Now we estimate $\min_{\pm} \inf_{x_0} \|u(\cdot) \pm u^*(\cdot - x_0)\|_{L^\infty(\mathbb{R}^n)}$. It is at this stage that the quantitative Pólya–Szegö inequality (2.10) comes into play. Let $r_1, r_2, r_3$ be any positive numbers which make (2.10) true. By (2.6),

\[
(2.24) \quad M_{u^*}(\sigma) \leq \mathcal{L}^1(\{s \in [0,1] : n\omega_n^{1/n} s^{1/n'} (-u^*(s)) \leq \sigma\}) \quad \text{for every } \sigma > 0.
\]

Thanks to inequality (2.24) and to the inclusion

\[
\{\varphi \leq t\} \subset \{|\varphi - \psi| \geq t\} \cup \{\psi \leq 2t\},
\]

which holds for any functions $\varphi, \psi : [0,1] \to [0, +\infty)$ and every $t > 0$, we get that

\[
(2.25) \quad M_{u^*}(\sigma) \leq \mathcal{L}^1(\{s \in [0,1] : |\Lambda s^{1/n'} (-u^*(s)) - (s^{-1/n'} / \Lambda)^{\frac{1}{n'}}| \geq \lambda \sigma\})
\]

\[
+ \mathcal{L}^1(\{s \in [0,1] : (s^{-1/n'} / \Lambda)^{\frac{1}{n'}} \leq 2\lambda \sigma\}) \quad \text{for every } \sigma > 0.
\]

By (2.19),

\[
(2.26) \quad \mathcal{L}^1(\{s \in [0,1] : |\Lambda s^{1/n'} (-u^*(s)) - (s^{-1/n'} / \Lambda)^{\frac{1}{n'}}| \geq \lambda \sigma\}) \leq \frac{p \epsilon}{(\lambda \sigma)^p} \quad \text{for every } \sigma > 0.
\]

On the other hand,

\[
(2.27) \quad \mathcal{L}^1(\{s \in [0,1] : (s^{-1/n'} / \Lambda)^{\frac{1}{n'}} \leq 2\lambda \sigma\})
\]

\[
\leq \max\{1 - [(2\lambda \sigma)^{p-1} \Lambda]^{-n'}, 0\} \leq [(2\lambda \sigma)^{p-1} \Lambda]^{-n'} \quad \text{for every } \sigma > 0.
\]
Combining (2.25)-(2.27) yields

\[(2.28) \quad M_u^\star (\sigma) \leq \frac{p \epsilon}{(\lambda \sigma)^p} + [(2 \lambda \sigma)^{p-1} \Lambda]^{n'} \text{ for every } \sigma > 0.\]

Let \( \gamma \) be a number in \((0, 1)\) so close to 1 that \( r_2 - \frac{1-\gamma}{p} > 0 \), where \( r_2 \) is the exponent appearing in (2.10). On choosing \( \sigma = \frac{1}{\Lambda} \frac{(1-\gamma)}{p} \) in (2.28), and observing that

\[(2.29) \quad \lambda = C_1(p, n)^{1/p} \|
abla u^\star \|_{L^r(\mathbb{R}^n)}^{1/p'} \leq C_1(p, n) \|
abla u^\star \|_{L^\infty(\mathbb{R}^n)}^{1/p'} = C_1(p, n),\]

we obtain

\[(2.30) \quad M_u^\star \left( \frac{(1-\gamma)}{p} \right) \leq p \epsilon + \left( 2^{p-1} n \omega_n^{1/n} C_1(p, n) \right)^{\frac{1-\gamma}{p} \gamma}.\]

By (2.14) and (2.15),

\[(2.31) \quad E(u) \leq \frac{\epsilon}{C_1(p, n)^p \|\nabla u^\star\|_{L^r(\mathbb{R}^n)}^p} \leq \epsilon.\]

Hence, owing to (2.25) and (2.31),

\[(2.32) \quad \left( \int |\nabla u^\star|^p \, dx \right)^{1/p} \epsilon^{\frac{1-\gamma}{p}} E(u)^{r_2} \leq \|
abla u\|_{L^r(\mathbb{R}^n)} E(u)^{r_2 - \frac{1-\gamma}{p} \gamma}.\]

From (2.10) applied with \( \sigma = \frac{1}{\Lambda} \frac{(1-\gamma)}{p} \), one deduces via (2.3), (2.30), (2.31), (2.32) that a constant \( C_7 \), depending only on \( p \) and \( n \), exists such that

\[(2.33) \quad \min_{\pm} \inf_{x_0} \| u(\cdot) + u^\star (\cdot - x_0) \|_{L^1(\mathbb{R}^n)} \leq C_7 \|
abla u\|_{L^r(\mathbb{R}^n)} (\epsilon^{\gamma} + \epsilon^{\frac{1-\gamma}{p} n'} + \epsilon^{r_2} + \|
abla u\|_{L^r(\mathbb{R}^n)} \epsilon^{r_2 - \frac{1-\gamma}{p} \gamma}).\]

To fix ideas, let us suppose that \( \min_{\pm} \) is attained in (2.33) with the minus sign, the other case being completely analogous. Assume, for a moment, that \( \epsilon \leq 1 \). Then, by (2.33) and (2.13), positive constants \( C_8 \) and \( \delta \), depending only on \( p \) and \( n \), exist such that

\[(2.34) \quad \inf_{x_0} \| u(\cdot) - u^\star (\cdot - x_0) \|_{L^1(\mathbb{R}^n)} \leq C_8 \epsilon^{\delta}.\]

Inequalities (1.5) and (2.3) entail that, for every \( x_0 \in \mathbb{R}^n \),

\[(2.35) \quad \| u(\cdot) - u^\star (\cdot - x_0) \|_{L^\infty(\mathbb{R}^n)} \leq C_2(p, n) \| u(\cdot) - u^\star (\cdot - x_0) \|_{L^1(\mathbb{R}^n)}^{1-\eta} \|
abla u(\cdot) - u^\star (\cdot - x_0) \|_{L^r(\mathbb{R}^n)}^{\eta} \leq 2^\eta C_2(p, n) \| u(\cdot) - u^\star (\cdot - x_0) \|_{L^1(\mathbb{R}^n)}^{1-\eta} \|
abla u\|_{L^r(\mathbb{R}^n)}^\eta.\]

On exploiting again the fact that \( \epsilon \leq 1 \), we deduce from (2.13), (2.34) and (2.35) that

\[(2.36) \quad \inf_{x_0} \| u(\cdot) - u^\star (\cdot - x_0) \|_{L^\infty(\mathbb{R}^n)} \leq C_9 \epsilon^{\delta(1-\eta)}.\]
for some positive constant \(C_9\) depending only on \(p\) and \(n\). Combining (2.36) and (2.23) tells us that
\[
\inf_{a,b,x_0} \|u - v_{a,b,x_0}\|_{L^\infty(\mathbb{R}^n)}
\leq \inf_{x_0} \left(\|u(\cdot) - u^\star(\cdot - x_0)\|_{L^\infty(\mathbb{R}^n)} + \inf_{a,b} \|u^\star(\cdot - x_0) - v_{a,b,x_0}(\cdot)\|_{L^\infty(\mathbb{R}^n)}\right)
\leq C_9\epsilon^{\delta(1-n)} + C_6\epsilon^{1/p} \leq (C_9 + C_6)\epsilon^\nu,
\]
if \(u\) satisfies (2.11), (2.12) and \(\epsilon \leq 1\). Here \(\nu = \min\{1/p, \delta(1-\eta)\}\). Since a constant \(C\) exists such that \(s^p - 1 \leq C(s - 1)\) if \(0 \leq s \leq 2^{1/p}\), inequality (2.37) ensures that
\[
\inf_{a,b,x_0} \|u - v_{a,b,x_0}\|_{L^\infty(\mathbb{R}^n)} \leq C_{10}(C_1(p,n)\|\nabla u\|_{L^p(\mathbb{R}^n)} - 1)^\nu
\]
for some positive constant \(C_{10}\) depending only on \(p\) and \(n\), and for every function \(u\) as in the statement satisfying, in addition, (2.11), (2.12) and (2.13). A proof of type (2.38) trivially continues to hold even if \(\epsilon > 1\), provided that (2.11) and (2.12) are in force, since in this case
\[
\inf_{a,b,x_0} \|u - v_{a,b,x_0}\|_{L^\infty(\mathbb{R}^n)}^{1/\nu} \leq \inf_{a,b,x_0} \|u - v_{a,b,x_0}\|_{L^\infty(\mathbb{R}^n)}
\leq 1 \leq \frac{1}{2^{1/p} - 1}(C_1(p,n)\|\nabla u\|_{L^p(\mathbb{R}^n)} - 1).
\]
Finally, if \(u\) is just as in the statement, then an application of (2.38) to the function \(\overline{u}\) given by
\[
\overline{u}(x) = \frac{u(cx)}{\|u\|_{L^\infty(\mathbb{R}^n)}} \quad \text{for } x \in \mathbb{R}^n,
\]
where \(c = L^n(\text{sprt } u)^{1/n}\) (a function fulfilling (2.11) and (2.12)), yields (1.9), with \(\alpha = 1/\nu\).

3. PROOF OF THEOREM 1.2

The outline of the proof of Theorem 1.2 is similar to that of Theorem 1.1. However, some complications arise, owing to the fact that Theorem 1.2 deals with a multiplicative inequality, and that functions whose support need not have finite measure are involved.

Proof of Theorem 1.2 Set
\[
C_{11} = \frac{1}{n\omega_n^{1/n}} \left(\frac{\Gamma(1 + p')\Gamma(1 - p'/n')}{\Gamma(2 + p'/n)}\right)^{1/p'}.
\]
Assume, for the time being, that \(u\) satisfies the additional conditions (2.12) and (3.1)
\[
\|u\|_{L^1(\mathbb{R}^n)} = C_{11}\left(\frac{1}{n} - \frac{1}{p}\right)\|\nabla u^\star\|_{L^p(\mathbb{R}^n)}.
\]
Define
\[
\delta = C_{2}(p,n)^{p/\eta}\|u\|_{L^1(\mathbb{R}^n)}^{(1-n)/(n-\eta)}\|\nabla u^\star\|_{L^p(\mathbb{R}^n)} - 1.
\]
Then, by (2.5), (2.4) and (1.3),
\[
0 \leq C_{2}(p,n)^{p/\eta}\|u\|_{L^1(\mathbb{R}^n)}^{(1-n)/(n-\eta)}\left(\|\nabla u\|_{L^p(\mathbb{R}^n)}^p - \|\nabla u^\star\|_{L^p(\mathbb{R}^n)}^p\right) \leq \delta
\]
and

\begin{equation}
0 \leq C_2(p, n)\|u^\#\|_{L^1_n(\Omega)}^{1-\eta} \|\nabla u^\#\|^p_{L^p(\mathbb{R}^n)} - 1
\leq C_2(p, n)^{\rho/\eta}\|u^\#\|_{L^1_n(\Omega)}^{(1-\eta)\rho/n} \|\nabla u^\#\|^p_{L^p(\mathbb{R}^n)} - 1 \leq \delta.
\end{equation}

Next set

\begin{equation}
\theta = \frac{1}{(n\omega_n^{1/n})^{1/p}} \left( \int_0^1 ((1-s)s^{-1/n'})^{p'} ds \right)^{\frac{1}{p'}} \left( \int_0^1 (n\omega_n^{1/n} s^{1/n'} (-u^{\#'}(s)))^{p} ds \right)^{-\frac{1}{p'}};
\end{equation}

and observe that

\begin{equation}
\theta = C_{11}^{\rho/p} \left( \int_{|u^\#| > u^\#(1)} |\nabla u^\#|^p dx \right)^{-\frac{1}{p'}};
\end{equation}

moreover, define

\begin{equation}
\Theta = n\omega_n^{1/n} \theta.
\end{equation}

The following chain holds:

\begin{equation}
1 = u^\#(0) = \int_0^1 u^\#(s) ds + \int_0^1 (1-s) (-u^{\#'}(s)) ds
\leq \int_0^1 u^\#(s) ds + \frac{1}{n\omega_n^{1/n}} \left( \int_0^1 ((1-s)s^{-1/n'})^{p'} ds \right)^{\frac{1}{p'}} \left( \int_0^1 (n\omega_n^{1/n} s^{1/n'} (-u^{\#'}(s)))^{p} ds \right)^{-\frac{1}{p'}}
- \frac{1}{p} \int_0^1 |\Theta s^{1/n'} (-u^{\#'}(s)) - ((1-s)s^{-1/n'} / \Theta) |^{p'} ds
= \int_0^\infty u^\#(s) ds + C_{11} \left( \int_0^\infty (n\omega_n^{1/n} s^{1/n'} (-u^{\#'}(s)))^{p} ds \right)^{\frac{1}{p'}} - \int_1^\infty u^\#(s) ds
\end{equation}

- \frac{1}{p} \int_0^1 |\Theta s^{1/n'} (-u^{\#'}(s)) - ((1-s)s^{-1/n'} / \Theta) |^{p'} ds
= C_2(p, n)\|u^\#\|_{L^1_n(\Omega)}^{1-\eta} \|\nabla u^\#\|^p_{L^p(\mathbb{R}^n)} - \int_1^\infty u^\#(s) ds
\end{equation}

- \frac{1}{p} \int_0^1 |\Theta s^{1/n'} (-u^{\#'}(s)) - ((1-s)s^{-1/n'} / \Theta) |^{p'} ds,

where the inequality is a consequence of Lemma 2.1 and the last equality of \textbf{3.1}. From \textbf{3.4} and \textbf{3.7} we deduce that

\begin{equation}
\int_0^1 |\Theta s^{1/n'} (-u^{\#'}(s)) - ((1-s)s^{-1/n'} / \Theta) |^{p'} ds \leq p\delta,
\end{equation}

\begin{equation}
\int_1^\infty u^\#(s) ds \leq \delta,
\end{equation}

From \textbf{3.8} and \textbf{3.9} we deduce that
and
\begin{equation}
\int_1^\infty (n\omega_n^{1/n} s^{1/n'}(-(u^*(s)))^p)ds \leq \frac{p\delta}{C_{11}} \left( \int_0^\infty (n\omega_n^{1/n} s^{1/n'}(-(u^*(s)))^p)ds \right)^{\frac{1}{p'}}.
\end{equation}

Notice that, in deriving (3.10), we have made use of the fact that \( p(s^{1/p} - r^{1/p}) \geq (s-r)s^{-1/p'} \) if \( 0 < r \leq s \).

Define \( \psi : [0, \infty) \rightarrow [0, \infty) \) as
\begin{equation}
\psi(s) = \begin{cases} 
J_s(1-r)^{1-\eta} r^{-\frac{s}{p'} \Theta} dr & \text{if } s \in [0, 1], \\
0 & \text{otherwise}.
\end{cases}
\end{equation}

Hence,
\begin{equation}
\psi(\omega_n |x|^n) = w_{a,b,0}(x) \quad \text{for } x \in \mathbb{R}^n,
\end{equation}

and for an appropriate choice of \( a \) and \( b \). Then, via an analogous argument as in the proof of (2.21), inequality (3.8) entails that
\begin{equation}
\|u^* - u^*(1) - \psi\|_{L^\infty((0,1)} \leq C_{12}\delta^{\frac{1}{p'}} \left( \int_0^\infty (n\omega_n^{1/n} s^{1/n'}(-(u^*(s)))^p)ds \right)^{\frac{1}{p'}}
\end{equation}
for some positive constant \( C_{12} \) depending only on \( p \) and \( n \). Hence, by (3.11) and (3.12), one gets
\begin{equation}
\|u^* - u^*(1) - \psi\|_{L^\infty((0,1)} \leq C_{13}\delta^{1/p}(1 + \delta)^{1/p'}
\end{equation}
for some positive constant \( C_{13} \) depending only on \( p \) and \( n \). On the other hand, defining \( U : [0, \infty) \rightarrow [0, \infty) \) as
\begin{equation}
U(s) = u^*(s + 1) \quad \text{for } s \geq 0,
\end{equation}
one has by (3.11) applied with \( u^* \) replaced by \( U \)
\begin{equation}
U(0) \leq C_{2}(p, n) \left( \int_0^\infty U(s)ds \right)^{1-\eta} \left( \int_0^\infty (n\omega_n^{1/n} s^{1/n'}(-U'(s)))^p)ds \right)^{\frac{1}{p'}}.
\end{equation}
Thus,
\begin{equation}
u^*(1) \leq C_{2}(p, n) \left( \int_1^\infty u^*(s)ds \right)^{1-\eta} \left( \int_1^\infty (n\omega_n^{1/n} s^{1/n'}(-u^*(s)))^p)ds \right)^{\frac{1}{p'}}
\end{equation}
\begin{equation}
\leq C_{2}(p, n)\delta^{1-\eta} \left( \frac{p\delta}{C_{11}} \|\nabla u^*\|_{L^p(\mathbb{R}^n)} \right)^{\frac{1}{p'}}
\end{equation}
\begin{equation}
= C_{14}\delta^{1-\eta/p'} \left( \|u^*\|_{L^1(\mathbb{R}^n)} \right)^{\frac{1}{p'}}
\end{equation}
\begin{equation}
\leq C_{14}\delta^{1-\eta/p'} ((1 + \delta)/C_{2}(p, n)) \frac{1}{p'},
\end{equation}
for some positive constant \( C_{14} \) depending only on \( p \) and \( n \). Notice that the second inequality is a consequence of (3.9) and (3.10), the equality of (3.11), and the last inequality of (3.13). Inequalities (3.11) and (3.13), and the fact that \( 1 - \eta/p' > 1/p \), easily imply that a constant \( C_{15} \), depending only on \( p \) and \( n \), exists such that
\begin{equation}
\inf_{a,b} \|u^*(\cdot - x_0) - w_{a,b,x_0}(\cdot)\|_{L^\infty(\mathbb{R}^n)} \leq C_{15}\delta^{\frac{1}{p'}}
\end{equation}
for every \( x_0 \in \mathbb{R}^n \).

Our next task is to estimate \( \inf \|u(\cdot) \pm u^*(\cdot - x_0)\|_{L^\infty(\mathbb{R}^n)} \). Define \( u_1 \) and \( u_2 : \mathbb{R}^n \rightarrow \mathbb{R} \) as
\begin{equation}
u_1(x) = \text{sign}(u(x)) \max\{|u(x)| - u^*(1), 0\}
\end{equation}
and
\[ u_2(x) = \text{sign}(u(x)) \min\{|u(x)|, u^*(1)\} \]
for \( x \in \mathbb{R}^n \), so that \( u = u_1 + u_2 \). A similar argument as in the proof of (2.28), exploiting (3.8), enables us to derive that
\[
M_{u_1} (\sigma) \leq \frac{p\delta}{(\theta \sigma)^p} + C_{16}[(\theta \sigma)^{p-1}(\Theta)^{n'} + (\theta \sigma)^{p-1}\Theta] \quad \text{for every } \sigma > 0,
\]
for some absolute constant \( C_{16} \). We skip the details of this derivation. Let us limit ourselves to mentioning that here we have made use of the inclusion
\[
\{ s \in [0, 1] : (1 - s)\frac{1}{\sigma - p, \Theta} s - \frac{1}{\sigma - n'} \leq t \} 
\subset \{ s \in [0, 1/2] : s^{-\sigma(1-p)\gamma} \leq t \} \cup \{ s \in [1/2, 1] : (1 - s)\frac{1}{\sigma - 1} \Theta - \frac{1}{\sigma - n'} \leq t \}
\]
for \( t > 0 \). Inequality (3.15), with \( \gamma = \frac{1}{\sigma} \frac{1}{\sigma - p, \Theta} \) and \( \gamma \in (0, 1) \) to be fixed later, and equation (3.15) entail that
\[
M_{u_1} (\delta) \leq \frac{p\delta}{\theta} - p \delta^\gamma + C_{17} \\delta^{\frac{1-n}{p}} \left( \int_{\{ u_1 \geq u^*(1) \}} |\nabla u^*|^p dx \right)^{-\frac{1}{p} - \frac{n}{p}} \quad (3.16)
\]
for some constant \( C_{17} \) depending only on \( p \) and \( n \). On the other hand,
\[
E(u_1) = \frac{\int_{\{ u_1 \geq u^*(1) \}} |\nabla u|^p dx - \int_{\{ u_1 \geq u^*(1) \}} |\nabla u^*|^p dx}{\int_{\{ u_1 \geq u^*(1) \}} |\nabla u^*|^p dx} 
\leq \frac{\int_{\mathbb{R}^n} |\nabla u|^p dx - \int_{\mathbb{R}^n} |\nabla u^*|^p dx}{\int_{\{ u_1 \geq u^*(1) \}} |\nabla u^*|^p dx} 
\leq \frac{C_2(p, n)^{p/\gamma}}{\delta} \| u \|_{L^r(\mathbb{R}^n)} \int_{\{ u_1 \geq u^*(1) \}} |\nabla u^*|^p dx 
= \frac{C_{18} \delta}{\int_{\mathbb{R}^n} |\nabla u^*|^p dx} \int_{\{ u_1 \geq u^*(1) \}} |\nabla u^*|^p dx 
\quad (3.17)
\]
for some constant \( C_{18} \) depending only on \( p \) and \( n \). Here, the first inequality follows from (3.3) applied to \( u_2 \), the second inequality from (3.10), and the last equality from (3.1). Finally, by (3.9) and (3.13),
\[
\int_{\mathbb{R}^n} |u_2|^p dx = \int_{1}^{\infty} u^*(s) ds \leq \delta + C_{14} \delta^{1-n/p'} (1 + \delta)/C_2(p, n) \quad (3.18)
\]
Now, let us apply (2.10) with \( u \) replaced by \( u_1 \), with \( \sigma = \frac{1}{\sigma} \frac{1}{\sigma - p, \Theta} \), and with \( r_1, r_2, r_3 \) so small that \( 1 - \frac{\sigma - p}{\sigma - n'} > 0 \), \( \frac{1}{p} - \frac{\sigma - p}{\sigma - n'} > 0 \) and \( \frac{1}{p} - \frac{\sigma - p}{\sigma - n'} > 0 \). Furthermore, we chose \( \gamma \) satisfying \( r_2 - \frac{1}{\sigma - p} > 0 \). Thus, from (3.10)–(3.18) and from the estimate \(|\{ |u_1| > 0 \}| \leq 1 \), we infer that a positive constant \( C_{19} \), depending only on \( p \) and \( n \),
exists such that

\[ (3.19) \]

\[
\min_{\pm} \inf_{x_0} \| u(\cdot) \pm u^\ast (\cdot - x_0) \|_{L^1(\mathbb{R}^n)} \\
\leq \min_{\pm} \inf_{x_0} \| u_1(\cdot) \pm u_1^\ast (\cdot - x_0) \|_{L^1(\mathbb{R}^n)} + 2 \int_{\mathbb{R}^n} |u_2| dx \\
\leq C_{19} \left[ \delta^{r_3} \left( \int_{\{u^\ast > u^\ast (1)\}} |\nabla u^\ast|^p dx \right)^{1/2} + \delta \left( \int_{\{u^\ast > u^\ast (1)\}} |\nabla u^\ast|^p dx \right)^{1/2 - \frac{r_3}{p}} \right] \\
+ \delta \left( \int_{\{u^\ast > u^\ast (1)\}} |\nabla u^\ast|^p dx \right)^{1 - \frac{1}{p}, r_2} \left( \int_{\{u^\ast > u^\ast (1)\}} |\nabla u^\ast|^p dx \right)^{1 - \frac{1}{p}, r_3} \\
+ 2\delta + 2C_{14} \delta^{1 - n/p'} (1 + \delta)/C_2 (p, n)^{n/p'}.
\]

Note that, owing to our choice of \( r_1, r_2, r_3 \) and \( \gamma \), all the exponents of \( \delta \) and of \( \int_{\{u^\ast > u^\ast (1)\}} |\nabla u^\ast|^p dx \) in (3.19) are positive. Furthermore, \( (1 - \frac{1}{n})r_1r_3 + \frac{1}{p} - r_1r_3 > 0 \) and \( (1 - \frac{1}{n})r_2r_3 + \frac{r_2}{p} + \frac{1}{p} - r_2r_3 > 0 \). Consequently, since, by (3.1) and (3.2),

\[ (3.20) \]

\[
\int_{\{u^\ast > u^\ast (1)\}} |\nabla u^\ast|^p dx \leq \int_{\mathbb{R}^n} |\nabla u^\ast|^p dx \leq \int_{\mathbb{R}^n} |\nabla u|^p dx \leq C_{20} (1 + \delta)^n
\]

for some positive constant \( C_{20} \), depending only on \( p \) and \( n \), inequality (3.19) ensures that

\[ (3.21) \]

\[
\min_{\pm} \inf_{x_0} \| u(\cdot) \pm u^\ast (\cdot - x_0) \|_{L^1(\mathbb{R}^n)} \leq C_{21} \sum_{i=1}^7 \delta^{v_i} (1 + \delta)^{\rho_i}
\]

for some positive constants \( C_{21} \) and \( v_i, \rho_i, i = 1, \ldots, 7 \), depending only on \( p \) and \( n \). From (3.14), (3.21) and (1.3), one can conclude that

\[ (3.22) \]

\[
\inf_{a, b, x_0} \| u - w_{a, b, x_0} \|_{L^\infty(\mathbb{R}^n)} \leq C_{22} \delta^v
\]

for some positive constants \( C_{22} \) and \( v \), depending only on \( p \) and \( n \), and for every \( u \) satisfying the additional constraints (2.12), (3.1) and \( \delta \leq 1 \). A similar argument as at the end of the proof of Theorem 1.1 eventually leads to (1.10) for every \( u \) as in the statement. \( \square \)
