Reduction Formulas for Multiple Series

By M. L. Glasser

Abstract. A simple procedure is given for reducing broad classes of multiple series to single series. Examples are given for double series.

Suppose that $A_1 A_2 = A_3$, where A_i is a function of u and possesses a series expansion $A_i = \sum_n \phi_i(n, u)$. Then we have

$$(1) \quad \sum_{m,n} \phi_1(n, u) \phi_2(m, u) = \sum_n \phi_3(n, u).$$

If both sides of (1) are multiplied by some function $f(u)$ and integrated over u , we shall have formally

$$(2) \quad \sum_{m,n} F_1(m, n) = \sum_n F_2(n).$$

This rather trivial procedure can lead to some remarkable and useful results, as we shall illustrate by some examples.

If f and g are two analytic functions, then, upon multiplication of their Taylor series, we obtain

$$(3) \quad \sum_{m,n=0}^{\infty} \frac{f^{(n)}(0) g^{(m)}(0)}{m! n!} F(m+n+1) = \sum_{n=0}^{\infty} \frac{(fg)^{(n)}(0)}{n!} F(n+1),$$

where F is any Mellin transform.

From the theory of elliptic functions [1], we have the Fourier series

$$\begin{aligned} (a) \quad \operatorname{cn}(2Kx/\pi) &= (2\pi/kK) \sum_0^{\infty} q^{(n+1/2)} (1+q^{2n+1})^{-1} \cos(2n+1)x, \\ (4) \quad (b) \quad (2K/\pi) \operatorname{dn}(2Kx/\pi) &= 1 + 4 \sum_1^{\infty} q^n (1+q^{2n})^{-1} \cos 2nx, \\ (c) \quad (2K/\pi) \operatorname{cn}(2Kx/\pi) \operatorname{dn}(2Kx/\pi) &= (2\pi/kK) \sum_0^{\infty} (2n+1) q^{n+1/2} (1-q^{2n+1})^{-1} \cos(2n+1)x, \end{aligned}$$

where $q = e^{-\pi K'/K}$. If we now let $K'/K = (2u/\pi)$, we find on multiplication of (4(a)) by (4(b)) that

$$(5) \quad \sum_{m,n=-\infty}^{\infty} \frac{\cos(2m+2n+1)x}{\cosh(2m+1)u \cosh 2nu} = 2 \sum_{n=0}^{\infty} \frac{(2n+1) \cos(2n+1)x}{\sinh(2n+1)u},$$

where the addition theorem and evenness for the cosine have been used to simplify the left-hand side.

Next, we multiply both sides of (5) by some summable function $f(x)$, with cosine transform $F(y)$, and integrate over x between the limits 0 and ∞ . Thus, we have

$$(6) \quad \sum_{m, n=-\infty}^{\infty} \frac{F(|2m+2n+1|)}{\cosh(2m+1)u \cosh 2nu} = 2 \sum_{n=0}^{\infty} \frac{(2n+1)F(2n+1)}{\sinh(2n+1)u}.$$

This remarkable result is valid for any summable function $F(x)$.

For example, consider $F_k(x) = 1$ for $(2k + \frac{3}{2}) > |x|$, 0 otherwise. Denoting the sum on the left-hand side of (6) by S_k , we find that it can be written

$$(7) \quad S_k = s_0 + s_1 + \cdots + s_k,$$

where

$$(8) \quad s_k = 4 \sum_{n=-\infty}^{\infty} [\cosh(4n+2k+1)u + \cosh(2k+1)u]^{-1}.$$

On the other hand, the sum on the right-hand side of (6) is finite and we have

$$(9) \quad S_k = 2[\operatorname{csch} u + 3 \operatorname{csch} 3u + \cdots + (2k+1) \operatorname{csch}(2k+1)u].$$

Therefore, $s_k = S_k - S_{k-1} = 2(2k+1) \operatorname{csch}(2k+1)u$ and, hence,

$$(10) \quad \begin{aligned} & \sum_{n=1}^{\infty} [\cosh 2nu + \cosh(2k+1)u]^{-1} \\ &= \frac{1}{2}[(2k+1) \operatorname{csch}(2k+1)u - \frac{1}{2} \operatorname{sech}^2(k + \frac{1}{2})u], \quad k = 0, 1, 2, \cdots \end{aligned}$$

In a similar way, we can derive

$$(11) \quad \sum_{m, n=-\infty}^{\infty} \frac{F(m+n+1) + F(m-n)}{\sinh(2m+1)u \cosh(2n+1)u} = 8 \sum_{n=1}^{\infty} \frac{nF(n)}{\cosh(2nu)},$$

$$(12) \quad \sum_{k, m, n=-\infty}^{\infty} \frac{F(k+m+n+1) + F(k-m+n)}{\cosh(2ku) \cosh(2m+1)u \sinh(2n+1)u} = 8 \sum_{n=1}^{\infty} \frac{n^2 F(n)}{\sinh(2nu)},$$

where F is any sine transform (and hence odd).

Thus, taking $F(1) = -F(-1) = 1$, $F(n) = 0$, $n \neq 1$, in (12), we obtain the interesting double series

$$(13) \quad \sum_{k, n=-\infty}^{\infty} \frac{\sinh[2(k+n)+1]u}{\cosh 2ku \sinh(2n+1)u [\cosh 2(2k+2n+1)u + \cosh 4u]} = \operatorname{csch}^2 2u.$$
