# ON THE CONVERGENCE-ABSCISSAS OF THE GENERALIZED FACTORIAL SERIES 

## CHUJI TANAKA

1. Introduction. We consider the generalized factorial series

$$
\begin{align*}
F(s)=\sum_{n=1}^{\infty} a_{n}\left[\lambda_{1} \lambda_{2} \cdots \lambda_{n}\right] & {\left[\left(s+\lambda_{1}\right)\left(s+\lambda_{2}\right) \cdots\left(s+\lambda_{n}\right)\right]^{-1}, }  \tag{1.1}\\
& s=\sigma+i t, \lambda_{n}=r_{n} e^{i \phi_{n}}(n=1,2, \cdots),
\end{align*}
$$

where

$$
\begin{equation*}
\lim _{n \rightarrow \infty} r_{n}=+\infty,\left|\phi_{n}\right| \leqq \phi<\pi / 2 \quad(n=1,2, \cdots) . \tag{1.2}
\end{equation*}
$$

In his classical note [1, §6], E. Landau has studied (1.1) in the case in which $\sum_{n=1}^{\infty} 1 / r_{n}=+\infty, \phi_{n}=0(n=1,2, \cdots)$. Under additional conditions, he has determined convergence-abscissas of (1.1) in terms of coefficients $a_{n}(n=1,2, \cdots)$. S. Pincherle [2], G. Belardinelli [3], and T. Fort [4, 5] have studied (1.1) with complex $\lambda_{n}$ ( $n=1,2, \cdots$ ) satisfying (1.2) and some other conditions. In this note, without any additional conditions, we shall determine the con-vergence-abscissas of (1.1) with real $\lambda_{n}(n=1,2, \cdots)$ in terms of coefficients $a_{n}(n=1,2, \cdots)$. In the case in which the $\lambda_{n}$ are complex, the convergence-domains of (1.1) are not generally halfplanes, and so the convergence-abscissas of (1.1) have no meaning.

The main theorems are:
Theorem I. In the case $\phi_{n}=0(n=1,2, \cdots)$, (1.1) has three con-vergence-abscissas, i.e. a simple convergence-abscissa $\sigma_{s}$, a uniform con-vergence-abscissa $\sigma_{u}$, and an absolute convergence-abscissa $\sigma_{a}$ such that $\sigma_{s}=\sigma_{u} \leqq \sigma_{a}$.

Remark. (1) In the convergence-problem of (1.1), the sequence of points $-\lambda_{n}(n=1,2, \cdots)$ is excluded from the $s$-plane by small circles with centres at $-\lambda_{n}(n=1,2, \cdots)$ and radii $\epsilon, \epsilon$ being a small positive constant.
(2) The divergence of $\sum_{n=1}^{\infty} 1 / r_{n}$ is not necessary for the validity of Theorem 1.

Theorem II. If $\sum_{n=1}^{\infty} 1 / r_{n}<+\infty$, the necessary and sufficient condition for (1.1) to be simply (absolutely) convergent at $s=s_{0}$ distinct from $-\lambda_{n}(n=1,2, \cdots)$ is that $\sum_{n=1}^{\infty} a_{n}\left(\sum_{n=1}^{\infty}\left|a_{n}\right|\right)$ converges. If

[^0]furthermore $\phi_{n}=0(n=1,2, \cdots)$, then three possibilities now present themselves:

| Case | $\sum_{n=1}^{\infty}\left\|a_{n}\right\|$ | $\sum_{n=1}^{\infty} a_{n}$ | $\sigma_{s}=\sigma_{u}$ | $\sigma_{a}$ |
| :---: | :---: | :---: | :---: | :---: |
| I | $<+\infty$ | convergent | $=-\infty$ | $=-\infty$ |
| II | $=+\infty$ | convergent | $=-\infty$ | $=+\infty$ |
| III | $=+\infty$ | divergent | $=+\infty$ | $=+\infty$ |

Theorem III. If $\sum_{n=1}^{\infty} 1 / r_{n}=+\infty, \phi_{n}=0(n=1,2, \cdots)$, then the three convergence-abscissas of (1.1) are determined respectively by
(a) $\quad \sigma_{s}=\sigma_{u}=\limsup _{n \rightarrow \infty} 1 / l_{n} \cdot \log \left|\sum_{v=1}^{n} a_{\nu} \exp \left(\phi\left(l_{v}\right)-\phi\left(l_{n}\right)\right)\right|$,
(b) $\quad \sigma_{a}=\underset{n \rightarrow \infty}{\lim \sup } 1 / l_{n} \cdot \log \left\{\sum_{v=1}^{n}\left|a_{v}\right| \exp \left(\phi\left(l_{n}\right)-\phi\left(l_{n}\right)\right)\right\}$,
where
(c)

$$
l_{n}=\sum_{i=1}^{n} l / r_{i} \quad\left(0<l_{1}<l_{2}<\cdots<l_{n} \rightarrow+\infty\right)
$$

(d) $\phi(x)$ is the positive and differentiable function defined for $x>0$ such that
(i) $\phi(x) \uparrow+\infty, \phi^{\prime}(x) \rightarrow+\infty$ as $x \rightarrow+\infty$.
(ii) for any given $\epsilon>0, \int^{+\infty} \exp (-\epsilon x)\left|\phi^{\prime}(x)\right| d x<+\infty$.

Corollary I (Equiconvergence Theorem) (T. Fort [4, p. 239]). Under the same conditions as in Theorem III, (1.1) has the same abscissa of simple convergence and the same abscissa of absolute convergence as the Dirichlet series

$$
\begin{equation*}
G(s)=\sum_{n=1}^{\infty} a_{n} \exp \left(-l_{n} s\right) \tag{1.3}
\end{equation*}
$$

Corollary II. Under the same conditions as in Theorem III, we have
(a)

$$
\begin{aligned}
\sigma_{t}=\sigma_{u} & =\underset{x \rightarrow \infty}{\lim \sup } 1 / x \cdot \log \left|\sum_{[x] \leq l_{n}<x} a_{n}\right| \\
\sigma_{a} & =\limsup _{x \rightarrow \infty} 1 / x \cdot \log \left\{\sum_{[x] \leq L_{n}<x}\left|a_{n}\right|\right\},
\end{aligned}
$$

where $[x]$ denotes the greatest integer contained in $x$.
(b)

$$
0 \leqq \sigma_{a}-\sigma_{a} \leqq \limsup _{n \rightarrow \infty} 1 / l_{n} \cdot \log n .
$$

2. Proof of Theorem I. We first prove some necessary lemmas, which are analogues of theorems concerning ordinary factorial series [6, pp. 171-174].

Lemma I. If (1.1) is simply convergent at $s=s_{0}$, then (1.1) is uniformly convergent in the angular domain $D\left(s_{0}, \vartheta, \phi\right):\left|\arg \left(s-s_{0}\right)\right| \leqq \vartheta$ $<(\pi / 2-\phi)$, where $\vartheta$ is an arbitrary but fixed constant.

As a special case of Lemma I, we have
Lemma I'. If (1.1) with real $\lambda_{n}(n=1,2, \cdots)$ is simply convergent at $s=s_{0}$, then (1.1) is uniformly convergent in the angular domain $D\left(s_{0}, \vartheta, 0\right):\left|\arg \left(s-s_{0}\right)\right| \leqq \vartheta<\pi / 2$, where $\vartheta$ is an arbitrary but fixed constant.

Under the assumptions that $\lim _{n \rightarrow \infty} \phi_{n}=0$, and $\sum_{n=1}^{\infty} 1 / r_{n}=+\infty$, T. Fort [4, p. 237, Theorem IV] has proved that (1.1) converges uniformly in the angular domain $D\left(s_{0}, \vartheta, 0\right)$, provided that it converges simply at $s=s_{0}$. Since we can put $\phi=\epsilon$ in Lemma $I, \epsilon$ being any small positive constant, this theorem is evidently contained in Lemma I.

Proof of Lemma I. We first establish the inequality

$$
\begin{equation*}
\left|s+\lambda_{n}\right|>\left|s_{0}+\lambda_{n}\right|+r \sin (\eta / 2) \quad \text { for } n \geqq n_{1} \tag{2.1}
\end{equation*}
$$

where
(i) $s \in D\left(s_{0}, \vartheta, \phi\right), r=\left|s-s_{0}\right|, \vartheta=\pi / 2-(\phi+\eta)(\eta>0)$,
(ii) $n_{1}$ is a sufficiently large integer.

In fact, putting $\theta=\arg \left(s-s_{0}\right)-\arg \left(s_{0}+\lambda_{n}\right)$, where $s \in D\left(s_{0}, \vartheta, \phi\right)$, we have easily

$$
\pi / 2+\eta / 2 \leqq \theta<3 \pi / 2-\eta / 2 \quad \text { for } n \geqq n_{1}
$$

so that

$$
\begin{aligned}
\left|s+\lambda_{n}\right|^{2} & =r^{2}+\left|s_{0}+\lambda_{n}\right|^{2}-2 r\left|s_{0}+\lambda_{n}\right| \cos \theta \\
& \geqq\left\{\left|s_{0}+\lambda_{n}\right|+r \sin (\eta / 2)\right\}^{2} \quad \text { for } n \geqq n_{1},
\end{aligned}
$$

which proves (2.1). Let us put

$$
b_{n}=a_{n}\left[\lambda_{1} \cdots \lambda_{n}\right]\left[\left(s_{0}+\lambda_{1}\right)\left(s_{0}+\lambda_{2}\right) \cdots\left(s_{0}+\lambda_{n}\right)\right]^{-1}
$$

$$
\begin{equation*}
c_{n}(s)=\left[\left(s_{0}+\lambda_{1}\right)\left(s_{0}+\lambda_{2}\right) \cdots\left(s_{0}+\lambda_{n}\right)\right]\left[\left(s+\lambda_{1}\right)\left(s+\lambda_{2}\right) \cdots\right. \tag{2.2}
\end{equation*}
$$

$$
\left.\left(s+\lambda_{n}\right)\right]^{-1}
$$

Equation (2.1) yields

$$
\begin{align*}
& \left|\left(s_{0}+\lambda_{n}\right) /\left(s+\lambda_{n}\right)\right|<\rho_{n}\left[\rho_{n}+r \sin (\eta / 2)\right]^{-1},  \tag{2.3}\\
& \left|\left(s-s_{0}\right) /\left(s+\lambda_{n+1}\right)\right|<r\left[\rho_{n+1}+r \sin (\eta / 2)\right]^{-1}, \quad \text { for } n \geqq n_{1},
\end{align*}
$$

where $s \in D\left(s_{0}, \vartheta, \phi\right), r=\left|s-s_{0}\right|$, and $\rho_{n}=\left|s_{0}+\lambda_{n}\right|$. Hence

$$
\begin{align*}
\left|c_{n}(s)-c_{n+1}(s)\right| & =\left|c_{n}(s)\left(s-s_{0}\right)\left(s+\lambda_{n+1}\right)^{-1}\right|  \tag{2.4}\\
& <|K(s)| \cdot d_{n} \cdot r\left[\rho_{n+1}+r \sin (\eta / 2)\right]^{-1},
\end{align*}
$$

where
$K(s)=\left[\left(s_{0}+\lambda_{1}\right)\left(s_{0}+\lambda_{2}\right) \cdots\left(s_{0}+\lambda_{n_{1}-1}\right)\right]\left[\left(s+\lambda_{1}\right)\left(s+\lambda_{2}\right) \cdots\left(s+\lambda_{n_{1}-1}\right)\right]^{-1}$, and

$$
d_{n}=\prod_{i=n_{1}}^{n} \rho_{n}\left[\rho_{n}+r \sin (\eta / 2)\right]^{-1}
$$

In $D_{0}$, which we get by excluding from $D\left(s_{0}, \vartheta, \phi\right)$ the sequence of circles with centres at $-\lambda_{n}(n=1,2, \cdots)$ and radii $\epsilon, \epsilon$ being a small positive constant, we have evidently

$$
\begin{equation*}
|K(s)|<K \tag{2.5}
\end{equation*}
$$

where $K$ is a suitable constant. Since

$$
d_{n} \cdot r \cdot\left[\rho_{n+1}+r \sin (\eta / 2)\right]^{-1}=\operatorname{cosec}(\eta / 2)\left(d_{n}-d_{n+1}\right),
$$

taking account of (2.4) and (2.5), we have for any large $N$

$$
\begin{align*}
\sum_{n=n_{1}}^{N}\left|c_{n}(s)-c_{n+1}(s)\right| & <K \operatorname{cosec}(\eta / 2) \sum_{n=n_{1}}^{N}\left(d_{n}-d_{n+1}\right)  \tag{2.6}\\
& <K \operatorname{cosec}(\eta / 2) d_{n_{1}}
\end{align*}
$$

uniformly in $D_{0}$.
Since $\sum_{n=1}^{\infty} b_{n}$ is convergent by the hypothesis, on account of (2.6) and du Bois-Reymond's Theorem [7, p. 315], $F(s)=\sum_{n=1}^{\infty} b_{n} c_{n}(s)$ is uniformly convergent in $D_{0}$. q.e.d.

Lemma II. If (1.1) is absolutely convergent at $s=s_{0}$, then $\sum_{n=1}^{\infty}\left|a_{n}\right|\left|\left(\lambda_{1} \lambda_{2} \cdots \lambda_{n}\right)\left[\left(s+\lambda_{1}\right)\left(s+\lambda_{2}\right) \cdots\left(s+\lambda_{n}\right)\right]^{-1}\right|$ is uniformly convergent in the angular domain $D\left(s_{0}, \vartheta, \phi\right)$, where $D\left(s_{0}, \vartheta, \phi\right)$ has the same meaning as in Lemma I.

As a corollary, we get
Lemma II'. If (1.1) with real $\boldsymbol{\lambda}_{\boldsymbol{n}}(\boldsymbol{n}=1,2, \cdots)$ is absolutely convergent at $s=s_{0}$, then (1.1) is absolutely and uniformly convergent in the
angular domain $D\left(s_{0}, \vartheta, 0\right)$.
Proof of Lemma II. Using the same notation as in Lemma I, (2.1) and (2.3) are also valid. Since

$$
\begin{aligned}
\left|\left|c_{n}(s)\right|-\left|c_{n+1}(s)\right|\right| & =\left|c_{n}(s)\right| \cdot\left|1-\left|\left(s_{0}+\lambda_{n+1}\right)\left(s+\lambda_{n+1}\right)^{-1}\right|\right| \\
& \leqq\left|c_{n}(s)\right| \cdot\left|\left(s-s_{0}\right)\left(s+\lambda_{n+1}\right)^{-1}\right|
\end{aligned}
$$

on account of (2.4) and (2.5), we obtain for any large $N$

$$
\begin{equation*}
\sum_{n=n_{1}}^{N}| | c_{n}(s)\left|-\left|c_{n+1}(s)\right|\right|<K \operatorname{cosec}(\eta / 2) \cdot d_{n_{1}} \tag{2.7}
\end{equation*}
$$

uniformly in $D_{0}$. Since $\sum_{n=1}^{\infty}\left|b_{n}\right|$ is convergent by the hypothesis, it results by virtue of (2.7) and du Bois-Reymond's theorem that $\sum_{n=1}^{\infty}\left|b_{n} \cdot c_{n}(s)\right|$ is uniformly convergent in $D_{0}$. q.e.d.

Lemma III. If (1.1) is simply convergent at $s=s_{0}$, and furthermore there exists a point $s_{1}$ contained in the angular domain $D\left(s_{0}, \pi / 2-\phi\right)$ : $\left|\arg \left(s-s_{0}\right)\right| \leqq \pi / 2-\phi$, such that for a sufficiently large integer $n_{1}$, we have

$$
\left|\arg \left(s_{1}+\lambda_{n}\right)\right| \leqq \phi \quad \text { for } n \geqq n_{1}
$$

then (1.1) is uniformly convergent in the angular domain $D\left(s_{2}, \pi / 2-\phi\right)$, where $s_{2}=s_{1}+\epsilon \sec \phi, \epsilon$ being any small positive constant.

As an immediate consequence of Lemma III, we get
Lemma III'. If (1.1) with real $\lambda_{n}(n=1,2, \cdots)$ is simply convergent at $s=s_{0}$, then (1.1) is uniformly convergent in the half-plane $D: \Re(s)$ $\geqq \Re\left(s_{0}\right)+\epsilon, \epsilon$ being any small positive constant.

In fact, we can put $\phi=0, s_{1}=\Re\left(s_{0}\right)$, and $s_{2}=\Re\left(s_{0}\right)+\epsilon$ in Lemma III.
Proof of Lemma III. We first prove

$$
\begin{equation*}
\left|s+\lambda_{n}\right| \geqq\left|s_{3}+\lambda_{n}\right|+\epsilon / 2 \quad \text { for } n \geqq n_{1}, \tag{2.8}
\end{equation*}
$$

where $s \in D\left(s_{2}, \pi / 2-\phi\right)$, and $s_{3}=s_{1}+\epsilon / 2 \cdot \sec \phi$. In fact, putting $\alpha_{n}=\arg \left(s_{3}+\lambda_{n}\right)$, we have evidently

$$
\begin{equation*}
\left|\alpha_{n}\right| \leqq \phi \quad \text { for } n \geqq n_{1} . \tag{2.9}
\end{equation*}
$$

Projecting the vector $\left(s+\lambda_{n}\right)$ perpendicularly on the vector $\left(s_{2}+\lambda_{n}\right)$, we get easily

$$
\left|s+\lambda_{n}\right| \geqq\left|s_{3}+\lambda_{n}\right|+\epsilon / 2 \cdot \sec \phi \cdot \cos \alpha_{n}
$$

so that, by (2.9),

$$
\left|s+\lambda_{n}\right| \geqq\left|s_{8}+\lambda_{n}\right|+\epsilon / 2,
$$

which proves (2.8).
Let us put

$$
\begin{align*}
& b_{n}=a_{n}\left[\lambda_{1} \cdots \lambda_{n}\right]\left[\left(s_{3}+\lambda_{1}\right)\left(s_{3}+\lambda_{2}\right) \cdots\left(s_{3}+\lambda_{n}\right)\right]^{-1} \\
& c_{n}(s)= {\left[\left(s_{3}+\lambda_{1}\right)\left(s_{3}+\lambda_{2}\right) \cdots\left(s_{3}+\lambda_{n}\right)\right] }  \tag{2.10}\\
& \cdot {\left[\left(s+\lambda_{1}\right)\left(s+\lambda_{2}\right) \cdots\left(s+\lambda_{n}\right)\right]^{-1} }
\end{align*}
$$

By (2.8) and arguments similar to those employed in the proof of Lemma I, we have

$$
\begin{align*}
\left|c_{n}(s)-c_{n+1}(s)\right| & =\left|c_{n}(s)\right| \cdot\left|\left(s-s_{3}\right)\left(s+\lambda_{n+1}\right)^{-1}\right| \\
& <|K(s)| \cdot d_{n} \cdot\left(\rho_{n}+\epsilon / 2\right)^{-1}, \tag{2.11}
\end{align*}
$$

where

$$
\begin{gathered}
K(s)=\left(s-s_{8}\right)\left[\left(s_{3}+\lambda_{1}\right) \cdots\left(s_{3}+\lambda_{n_{1}-1}\right)\right] \\
\cdot\left[\left(s+\lambda_{1}\right) \cdots\left(s+\lambda_{n_{1}-1}\right)\right]^{-1} \\
\rho_{n}=\left|s_{8}+\lambda_{n}\right|, \quad d_{n}=\prod_{i=n_{1}}^{n} \rho_{i}\left(\rho_{i}+\epsilon / 2\right)^{-1} .
\end{gathered}
$$

Since $d_{n}\left(\rho_{n}+\epsilon / 2\right)^{-1}=2 / \epsilon \cdot\left(d_{n}-d_{n+1}\right)$, and $K(s)=O(1)$ in the domain $D_{0}$, as is easily seen by excluding from $D\left(s_{2}, \pi / 2-\phi\right)$ the sequence of small circles with centres at $-\lambda_{n}(n=1,2, \cdots)$ and radii $\epsilon^{\prime}>0$, by virtue of (2.11) we have

$$
\left|c_{n}(s)-c_{n+1}(s)\right|<2 K / \epsilon \cdot\left(d_{n}-d_{n+1}\right) \quad \text { for } n \geqq n_{1},
$$

uniformly in $D_{0}$, where $K$ is a suitable constant. Hence

$$
\begin{equation*}
\sum_{n=n_{1}}^{N}\left|c_{n}(s)-c_{n+1}(s)\right|<2 K / \epsilon \cdot\left(d_{n_{1}}-d_{N+1}\right)<2 K / \epsilon \cdot d_{n_{1}} \tag{2.12}
\end{equation*}
$$

uniformly in $D_{0}$ for any given $N$.
Since (1.1) is simply convergent at $s=s_{0}$ by virtue of Lemma I, it follows from (2.12) and du Bois-Reymond's theorem that $F(s)$
$=\sum_{n=1}^{\infty} b_{n} c_{n}(s)$ is uniformly convergent in $D_{0}$. q.e.d.
Now we are in a position to prove Theorem I.
Proof of Theorem I. If (1.1) is simply (absolutely) convergent at $s=s_{0}$, then (1.1) is also simply (absolutely) convergent at $s=s_{1}$ with $\Re\left(s_{0}\right)<\Re\left(s_{1}\right)$ by virtue of Lemma $I^{\prime}$ (Lemma II'). Hence there exists a simple (absolute) convergence-abscissa $\sigma_{s}\left(\sigma_{a}\right)$ of (1.1), and we have evidently $\sigma_{s} \leqq \sigma_{a}$.

For any given $\epsilon>0$, (1.1) is simply convergent at $s=\sigma_{\varepsilon}+\epsilon / 2$, so that by Lemma III', (1.1) is uniformly convergent for $\Re(s) \geqq \sigma_{s}+\epsilon$. But since (1.1) is not simply convergent on $s=\sigma_{s}-\epsilon$, (1.1) is not uni-
formly convergent for $\Re(s) \geqq \sigma_{s}-\epsilon$. Hence $\sigma_{u}$ coincides with $\sigma_{s}$. Thus we have $\sigma_{s}=\sigma_{u} \leqq \sigma_{a}$. q.e.d.
3. Proof of Theorem II. Since $\sum_{n=1}^{\infty} 1 / r_{n}<+\infty$, the infinite product $g(s)=\prod_{n=1}^{\infty}\left(1+s / \lambda_{n}\right)$ converges, so that we have

$$
\begin{equation*}
0<|g(s)|<+\infty \quad \text { for } s \neq-\lambda_{n}(n=1,2, \cdots) \tag{3.1}
\end{equation*}
$$

Let us put

$$
c_{n}(s)=\left[\lambda_{1} \cdots \lambda_{n}\right]\left[\left(s+\lambda_{1}\right)\left(s+\lambda_{2}\right) \cdots\left(s+\lambda_{n}\right) \cdot\right]^{-1}=\left[g_{n}(s)\right]^{-1}
$$

where $g_{n}(s)=\prod_{i=1}^{n}\left(1+s / \lambda_{i}\right)$. Since

$$
c_{n}(s)-c_{n+1}(s)=\left[g_{n}(s) \cdot \lambda_{n+1}\right]^{-1} \cdot s\left(1+s / \lambda_{n+1}\right)^{-1}
$$

by (3.1) we get

$$
\left|c_{n}(s)-c_{n+1}(s)\right|<K_{1}|g(s)|^{-1} \cdot 1 / r_{n+1} \quad \text { for } n \geqq n_{1}
$$

where (i) $K_{1}$ is a suitable constant, (ii) $n_{1}$ is a sufficiently large integer. Hence

$$
\begin{equation*}
\sum_{n=n_{1}}^{\infty}\left|c_{n}(s)-c_{n+1}(s)\right|<K_{1}|g(s)|^{-1} \cdot \sum_{n=n_{1}}^{\infty} 1 / r_{n+1}<+\infty \tag{3.2}
\end{equation*}
$$

If $\sum_{n=1}^{\infty} a_{n}$ converges, then by (3.2) and du Bois-Reymond's theorem, $F(s)=\sum_{n=1}^{\infty} a_{n} c_{n}(s)$ also converges for $s$ different from $-\lambda_{n}$ ( $n=1,2, \cdots$ ).

Next suppose that $F\left(s_{0}\right)=\sum_{n=1}^{\infty} b_{n}\left(s_{0}\right)$ converges for $s=s_{0} \neq-\lambda_{n}$ ( $n=1,2, \cdots$ ), where

$$
b_{n}\left(s_{0}\right)=a_{n}\left[\lambda_{1} \cdots \lambda_{n}\right]\left[\left(s_{0}+\lambda_{1}\right)\left(s_{0}+\lambda_{2}\right) \cdots\left(s_{0}+\lambda_{n}\right)\right]^{-1}
$$

Since $g_{n+1}\left(s_{0}\right)-g_{n}\left(s_{0}\right)=g_{n}\left(s_{0}\right) \cdot s_{0} \lambda_{n+1}$, by (3.1) we get

$$
\left|g_{n+1}\left(s_{0}\right)-g_{n}\left(s_{0}\right)\right|<\left|g\left(s_{0}\right)\right| \cdot K_{2} / r_{n+1} \quad \text { for } n \geqq n_{2}
$$

where (i) $K_{2}$ is a suitable constant, (ii) $n_{2}$ is a sufficiently large integer, so that

$$
\begin{equation*}
\sum_{n=n_{2}}^{\infty}\left|g_{n+1}\left(s_{0}\right)-g_{n}\left(s_{0}\right)\right|<\left|g\left(s_{0}\right)\right| \cdot K_{2} \cdot \sum_{n=n_{2}}^{\infty} 1 / r_{n+1}<+\infty \tag{3.3}
\end{equation*}
$$

Since $\sum_{n=1}^{\infty} b_{n}\left(s_{0}\right)$ converges, by (3.3) and du Bois-Reymond's theorem, $\sum_{n=1}^{\infty} a_{n}=\sum_{n=1}^{\infty} b_{n}\left(s_{0}\right) g_{n}\left(s_{0}\right)$ is also convergent.

By entirely similar arguments, we can prove that the necessarysufficient condition for (1.1) to converge absolutely at $s=s_{0}$ different from $-\lambda_{n}(n=1,2, \cdots)$ is that $\sum_{n=1}^{\infty}\left|a_{n}\right|<+\infty$.

If $\sum_{n=1}^{\infty} 1 / r_{n}<+\infty$ and $\phi_{n}=0(n=1,2, \cdots)$, then the second part
of Theorem II immediately follows from Theorem I and what is proved above.
4. Proof of Theorem III. Let us put

$$
\begin{equation*}
k=\underset{n \rightarrow \infty}{\lim \sup } 1 / l_{n} \cdot \log \left|\sum_{n=1}^{n} a_{v} \exp \left(\phi\left(l_{\nu}\right)-\phi\left(l_{n}\right)\right)\right| . \tag{4.1}
\end{equation*}
$$

We shall first establish the inequality

$$
\begin{equation*}
k \leqq \sigma_{s} \tag{4.2}
\end{equation*}
$$

Since (1.1) is simply convergent for $s=\sigma>\sigma_{s}$, there exists a constant $K$ such that

$$
\begin{equation*}
\left|S_{n}\right|<K \quad(n=1,2, \cdots) \tag{4.3}
\end{equation*}
$$

where

$$
S_{n}=\sum_{i=1}^{n} a_{i}\left[\lambda_{1} \cdots \lambda_{i}\right]\left[\left(\sigma+\lambda_{1}\right)\left(\sigma+\lambda_{2}\right) \cdots\left(\sigma+\lambda_{i}\right)\right]^{-1} .
$$

Putting $S_{0}=0$ and applying Abel's transformation, we have

$$
\begin{equation*}
\sum_{i=1}^{n} a_{i} \exp \left(\phi\left(l_{i}\right)\right)=\sum_{i=1}^{n-1} S_{i}(f(i)-f(i+1))+S_{n} f(n) \tag{4.4}
\end{equation*}
$$

where $f(i)=\exp \left(\phi\left(l_{i}\right)\right) \cdot \prod_{k=1}^{i}\left(1+\sigma / \lambda_{k}\right)$. On the other hand,

$$
\begin{equation*}
f(i)=Q(\sigma) \cdot \exp \left\{\phi\left(l_{i}\right)+l_{i}\left(\sigma+\epsilon_{i}(\sigma)\right)\right\} \quad \text { for } i>n_{1} \tag{4.5}
\end{equation*}
$$

where

$$
\begin{equation*}
Q(\sigma)=\prod_{n=1}^{n_{1}}\left(1+\sigma / \lambda_{n}\right) \exp \left(-\sigma / \lambda_{n}\right) \tag{i}
\end{equation*}
$$

$$
\begin{equation*}
\lim _{i \rightarrow \infty} \epsilon_{i}(\sigma)=0, \tag{ii}
\end{equation*}
$$

(iii)
$n_{1}$ is a sufficiently large integer.
In fact, since

$$
(1+x)=\exp \left(x+x^{2} \cdot \rho(x)\right),|\rho(x)| \leqq 1 \quad \text { for }|x| \leqq 1 / 2,
$$

we can easily obtain the relation

$$
\begin{align*}
f(i) & =\prod_{n=1}^{n_{1}}\left(1+\sigma / \lambda_{n}\right) \exp \left(-\sigma / \lambda_{n}\right) \\
& \times \exp \left\{\phi\left(l_{i}\right)+\sigma l_{i}+\sigma^{2} \cdot \vartheta(\sigma)\left(\sum_{n=1}^{i} 1 / \lambda_{n}^{2}\right)\right\}, \tag{4.6}
\end{align*}
$$

where (i) $\left|\sigma / \lambda_{n}\right| \leqq 1 / 2$ for $n>n_{1}$, (ii) $|\vartheta(\sigma)| \leqq 1$. Since $\lim _{i \rightarrow \infty} 1 / l_{i}$ - $\sum_{n=1}^{i} 1 / \lambda_{n}^{2}=0$, (4.6) gives (4.5).

Taking account of the hypothesis (d) part (i), we can easily prove that

$$
g(i) \uparrow \infty \quad \text { for } i>n_{2}
$$

where
(i) $g(i)=\exp \left(\phi\left(l_{i}\right)+l_{i}\left(\sigma+\epsilon_{i}(\sigma)\right)\right)$,
(ii) $n_{2}$ is a sufficiently large integer.

Therefore, putting $N=\operatorname{Max}\left(n_{1}, n_{2}\right)$, by (4.4) and (4.3) we have

$$
\begin{aligned}
\left|\sum_{i=1}^{n} a_{i} \exp \left(\phi\left(l_{i}\right)\right)\right| \leqq K \cdot & \left|\sum_{i=1}^{N} f(i)-f(i+1)\right|+K|Q(\sigma)| \\
& \cdot\left\{\sum_{i=N+1}^{n-1} g(i+1)-g(i)+g(n)\right\},
\end{aligned}
$$

so that for sufficiently large $n$,

$$
\left|\sum_{i=1}^{n} a_{i} \exp \left(\phi\left(l_{i}\right)\right)\right|<3 K \cdot|Q(\sigma)| \cdot g(n)
$$

Hence $k \leqq \sigma+\lim _{n \rightarrow \infty} \epsilon_{n}(\sigma)=\sigma$. Letting $\sigma \rightarrow \sigma_{\text {A }}$, we have $k \leqq \sigma_{\text {A }}$, which proves (4.2).

Next we shall prove

$$
\begin{equation*}
\sigma_{t} \leqq k \tag{4.7}
\end{equation*}
$$

By the definition of $k$, for any given $\delta>0$, there exists a constant $N$ such that

$$
\begin{equation*}
\left|T_{n}\right|<U_{n}=\exp \left\{\phi\left(l_{n}\right)+l_{n}(k+\delta / 2)\right\} \quad \text { for } n \geqq N \tag{4.8}
\end{equation*}
$$

where $T_{n}=\sum_{k=1}^{n} a_{i} \exp \left(\phi\left(l_{i}\right)\right)$. Taking account of $a_{n}=\left(T_{n}-T_{n-1}\right)$ $\exp \left(-\phi\left(l_{n}\right)\right)$, by Abel's transformation we get

$$
\begin{gather*}
\sum_{i=N+1}^{M} a_{i}\left[\lambda_{1} \cdots \lambda_{i}\right]\left[\left(k+\delta+\lambda_{1}\right)\left(k+\delta+\lambda_{2}\right) \cdots\left(k+\delta+\lambda_{i}\right)\right]^{-1}  \tag{4.9}\\
\quad=\sum_{i=N+1}^{M-1} T_{i}(h(i)-h(i+1))-T_{N} h(N+1)+T_{M} h(M)
\end{gather*}
$$

where $h(i)=\exp \left(-\phi\left(l_{i}\right)\right) \cdot\left[\prod_{k=1}^{k}\left(1+(k+\delta) / \lambda_{k}\right)\right]^{-1}$. By arguments similar to those employed before we may write

$$
\begin{equation*}
h(i)=K \cdot g(i) \quad \text { for } i>n_{1} \tag{4.10}
\end{equation*}
$$

where

$$
\begin{equation*}
K=\left[\prod_{n=1}^{n_{1}}\left(1+(k+\delta) / \lambda_{n}\right) \cdot \exp \left(-(k+\delta) / \lambda_{n}\right)\right]^{-1} \tag{i}
\end{equation*}
$$

(ii) $g(i)=\exp \left\{-\left(\phi\left(l_{i}\right)+l_{i}\left(k+\delta+\epsilon_{i}\right)\right)\right\}$,
(iii) $\lim _{i \rightarrow \infty} \epsilon_{i}=0$,
(iv) $\quad n_{1}$ is a sufficiently large integer.

Accordingly, by (4.8), (4.9), and (4.10) we obtain

$$
\begin{align*}
& \left|\sum_{i=N+1}^{M} a_{i}\left[\lambda_{1} \cdots \lambda_{i}\right]\left[\left(k+\delta+\lambda_{1}\right)\left(k+\delta+\lambda_{2}\right) \cdots\left(k+\delta+\lambda_{i}\right)\right]^{-1}\right|  \tag{4.11}\\
& \quad \leqq|K|\left\{\sum_{i=N+1}^{M-1} U_{i}|g(i)-g(i+1)|+U_{N} g(N+1)+U_{M} g(M)\right\} .
\end{align*}
$$

On the other hand, for sufficiently large $i$, we get easily

$$
\begin{aligned}
|g(i)-g(i+1)| & =O\left(\left|\int_{l_{i}}^{l_{i+1}} \frac{d}{d x} \exp (-(\phi(x)+x(k+\delta))) d x\right|\right) \\
& =O\left(1 / U_{i} \cdot \int_{l_{i}}^{l_{i+1}} \exp (-\delta / 2 \cdot x)\left|\phi^{\prime}(x)\right| d x\right)
\end{aligned}
$$

Hence, by (4.9), (4.10) and the hypothesis (d) part (ii), we get for sufficiently large $N$

$$
\begin{aligned}
& \left|\sum_{i=N+1}^{M} a_{i}\left[\lambda_{1} \cdots \lambda_{i}\right]\left[\left(k+\delta+\lambda_{1}\right)\left(k+\delta+\lambda_{2}\right) \cdots\left(k+\delta+\lambda_{i}\right)\right]^{-1}\right| \\
& =O\left(\int_{l_{M+1}}^{l_{M}} \exp (-\delta / 2 \cdot x)\left|\phi^{\prime}(x)\right| d x\right)+O\left(\exp \left(-l_{N+1}\left(\delta / 2+\epsilon_{N+1}\right)\right)\right) \\
& \quad+O\left(\exp \left(-l_{M}\left(\delta / 2+\epsilon_{M}\right)\right)\right)=o(1),
\end{aligned}
$$

so that (1.1) is simply convergent at $s=k+\delta$. Therefore

$$
\sigma_{t}<k+\delta
$$

for any given $\delta>0$, which proves (4.6).
Thus, by (4.3), (4.7), and Theorem 1, we have

$$
k=\sigma_{s}=\sigma_{u},
$$

which proves (a) of Theorem III. By the slight modification of the above arguments, we can also prove (b) of Theorem III.
5. Proof of corollaries. By M. Fujiwara's theorem [8], the simple convergence-abscissa $\sigma_{s}(G)$ and the absolute convergence-abscissa
$\sigma_{a}(G)$ of $G(s)$ are given respectively by

$$
\begin{align*}
& \sigma_{s}(G)=\underset{n \rightarrow \infty}{\lim \sup } 1 / l_{n} \cdot \log \left|\sum_{n=1}^{n} a_{\nu} \exp \left(l_{r}^{2}-l_{n}^{2}\right)\right|  \tag{5.1}\\
& \sigma_{a}(G)=\lim _{n \rightarrow \infty} \sup 1 / l_{n} \cdot \log \left\{\sum_{n=1}^{n}\left|a_{\nu}\right| \exp \left(l_{p}^{2}-l_{n}^{2}\right)\right\}
\end{align*}
$$

Since $\phi(x)=x^{2}$ evidently satisfies the conditions of Theorem III, taking account of Theorem III and (5.1) we get

$$
\sigma_{s}=\sigma_{s}(G), \quad \sigma_{a}=\sigma_{a}(G)
$$

which proves Corollary I.
By T. Kojima's theorem [9], we may write

$$
\begin{aligned}
\sigma_{s}(G) & =\underset{x \rightarrow \infty}{\lim \sup } 1 / x \cdot \log \left|\sum_{[x] \leqq l_{n}<x} a_{n}\right|, \\
\sigma_{a}(G) & =\limsup _{x \rightarrow \infty} 1 / x \cdot \log \left\{\sum_{[x] \leqq l_{n}<x}\left|a_{n}\right|\right\},
\end{aligned}
$$

so that the first part of Corollary II follows immediately from Corollary I. On the other hand, by a well known theorem [10, p. 49], we have

$$
0 \leqq \sigma_{a}(G)-\sigma_{s}(G) \leqq \lim _{n \rightarrow \infty} \sup 1 / 1_{n} \cdot \log n,
$$

which proves the second part of corollary II.
