## A NOTE ON A REDUCIBLE CONTINUUM

## E. L. BETHEL

In [4], Knaster shows that there exists an irreducible compact metric continuum $M$ which has a monotone continuous decomposition $G$ such that each element of $G$ is nondegenerate and $M / G$ is an arc. Also, he raised the question as to whether there existed an irreducible continuum $M$ which has a monotone continuous decomposition $G$ such that each element of $G$ is an arc and $M / G$ is an arc. E. E. Moise settled this question in the negative in [5]. In [3], M. E. Hamstrom showed that if $G$ is a monotone continuous decomposition of a compact metric continuum such that each element of $G$ is a nondegenerate continuous curve and $M / G$ is an arc, then it is not the case that $M$ is irreducible. E. Dyer generalized this result by showing in [2] that if $M$ is a compact metric continuum and $G$ is a monotone continuous decomposition of $M$ such that each element of $G$ is nondegenerate and decomposable, then it is not the case that $M$ is irreducible. A purpose of this note is to extend Dyer's result somewhat.

The author is indebted to the referee for some suggestions which have been incorporated in this note. In particular, a weakened hypothesis in Theorem 2.

Theorem 1. Let $M$ denote a compact metric continuum and $G a$ nondegenerate monotone continuous decomposition of $M$ each of whose elements is nondegenerate. If $H$ is a subcollection of $G$ each of whose elements is snakelike and indecomposable, and if $H^{*}$ is dense in $M$, then uncountably many elements of $G$ are indecomposable.

Proof. Let $I_{1}$ denote an element of $H$, and let $C_{1}$ denote the first chain in a sequence of defining chains for $I_{1}$, and let $L_{1}$ and $L_{2}$ denote the end links of $C_{1}$. Since $H^{*}$ is dense in $M$, and $G$ is a continuous collection, $C_{1}$ contains two elements $I(10)$ and $I(11)$ of $H$ such that $I(10)$ and $I(11)$ intersects every link of $C_{1}$. Let $\left\{C_{n}(10)\right\}$ and $\left\{C_{n}(11)\right\}$ denote chain sequences which define $I(10)$ and $I(11)$ respectively.

[^0]It follows that there is some $C_{i}(10)$ of $\left\{C_{n}(10)\right\}$ and some $C_{j}(11)$ of $\left\{C_{n}(11)\right\}$ such that (1) each is a refinement of $C_{1}$, (2) each has links intersecting the first and last links of $C_{1}$, and (3) there exist points $A_{1}$ and $A_{2}$ of $L_{1}$ and $L_{2}$ respectively, such that if $U$ is a coherent two region collection of either $C_{i}(10)$ or $C_{j}(11)$ which intersects $A_{i}$, ( $i=1,2$ ), then $U^{*} \subset L_{i},(i=1,2)$. Furthermore, the closure of the union of both chains does not intersect $I_{1}$, and the diameter of each link is less than $1 / 2$. By Theorem 2 of [1], there is some $C(10)$ of $\left\{C_{n}(10)\right\}$ and a $C(11)$ of $\left\{C_{n}(11)\right\}$ such that $C(10)$ and $C(11)$ each is a refinement of and loop in $C_{i}(10)$ and $C_{j}(11)$ respectively. It is an easy exercise to show that both $C(10)$ and $C(11)$ loop in $C_{1}$ also.

Now repeat the process used for the construction of $C(10)$ and $C(11)$ in both $C(10)$ and $C(11)$, where $C(10)$ and $C(11)$ assume the role of $C_{1}$ and each of $I(10)$ and $I(11)$ assume the role of $I_{1}$. By induction, we may define a sequence of chains $\left\{C\left(i_{1} \cdots i_{n}\right)\right\},\left(i_{k}=0,1\right)$, such that (1) $I\left(i_{1} \cdots i_{n}\right)$ is an element of $H$ which is a subset of the union of the links of $C\left(i_{1} \cdots i_{n}\right)$ and intersects each link of $C\left(i_{1} \cdots i_{n}\right)$, (2) $C\left(i_{1} \cdots i_{n} k\right),(k=0,1)$, loops and is a refinement of $C\left(i_{1} \cdots i_{n}\right)$, and (3) each link of $C\left(i_{1} \cdots i_{n}\right)$ has diameter less than $1 / n$. Thus, each sequence $\left\{i_{n}\right\},\left(i_{n}=0,1\right)$, defines a sequence of chains such that the common part of the sequence of chains is an indecomposable continuum $I$ by Theorem 2 of [1]. Since $I\left(i_{1} \cdots i_{n}\right)$ intersects each link of $C\left(i_{1} \cdots i_{n}\right)$, we have a sequence of elements of $G$ converging to $I$, and $I \cap I\left(i_{1} \cdots i_{n}\right)=\varnothing$, it follows that $I \in G$. Since there are uncountably many sequences $\left\{i_{n}\right\}, G$ contains uncountably many snakelike indecomposable continua.

Theorem 2. Let $M$ denote a compact irreducible continuum, and let $G$ be a nondegenerate monotone continuous decomposition of $M$ each of whose elements is nondegenerate and either snakelike or decomposable. If $M / G$ has a dense set of separating points, then uncountably many elements of $G$ are indecomposable.

Proof. Suppose the contrary. Let $G^{\prime}$ denote the elements of $G$ which are indecomposable and suppose $G^{\prime}$ is countable. Now ( $G^{\prime}$ )* is not dense in $M$ since this would imply that $G^{\prime}$ is uncountable by Theorem 1. Let $A$ and $B$ denote two points between which $M$ is irreducible, and let $g$ denote a separating element of $G$ which does not belong to $G^{\prime}$. There exists an open set $D$ with respect to $M / G$ containing $g$ such that $\bar{D} \cap\left(H \cup g_{A} \cup g_{B}\right)=\varnothing$, where $g_{A}$ and $g_{B}$ are the elements of $G$ containing $A$ and $B$ respectively. There is some subcontinuum $K$ of $M / G$ such that $K$ is irreducible from $M / G-D$ to $g$. It follows that each element of $K$ is decomposable. Since the set of
separating points are dense in $M / G$, there is a separating point $g^{\prime}$ of $K$ distinct from $g$. Furthermore, there is a subcontinuum $K^{\prime}$ of $K$ irreducible from $g^{\prime}$ to $g$. But since each element of $K^{\prime}$ is decomposable, by Dyer's theorem, there is a proper subcontinuum $L$ of $\left(K^{\prime}\right)^{*}$ intersecting $g$ and $g^{\prime}$. Since $g$ and $g^{\prime}$ are separating points of $M / G$, it now easily follows that $M$ is not irreducible from $A$ to $B$, a contradiction. Hence, uncountably many elements of $G$ are indecomposable.

Remark. May the stipulation that $M / G$ has a dense set of separating points be removed or replaced by a weaker stipulation? Indeed, may the stipulation that the indecomposable elements be snakelike be removed?
