SUMS OF QUOTIENTS OF ADDITIVE FUNCTIONS

JEAN-MARIE DE KONINCK

ABSTRACT. Denote by $\omega(n)$ and $\Omega(n)$ the number of distinct prime factors of n and the total number of prime factors of n , respectively. Given any positive integer α , we prove that

$$\sum_{2 \leq n \leq x} \Omega(n)/\omega(n) = x + x \sum_{i=1}^{\alpha} a_i/(\log \log x)^i + O(x/(\log \log x)^{\alpha+1}),$$

where $a_1 = \sum_p 1/p(p-1)$ and all the other a_i 's are computable constants. This improves a previous result of R. L. Duncan.

Denote by $\omega(n)$ and $\Omega(n)$ the number of distinct prime factors of n and the total number of prime factors of n , respectively. R. L. Duncan [3] proved that

$$\sum_{2 \leq n \leq x} \Omega(n)/\omega(n) = x + O(x/\log \log x).$$

Duncan's result was based on the elementary estimate

$$(1) \quad \sum_{2 \leq n \leq x} 1/\omega(n) = O(x/\log \log x).$$

In a previous paper [1], we gave estimates of $\sum'_{n \leq x} 1/f(n)$ for a large class of additive functions $f(n)$ (where $\sum'$ denotes summation over those values of n for which $f(n) \neq 0$), which in particular improved considerably the estimate (1). Such sums were further studied by De Koninck and Galambos [2].

In this paper, we prove the following:

THEOREM. *Let α be an arbitrary positive integer; then*

$$\sum'_{n \leq x} \Omega(n)/\omega(n) = x + x \sum_{i=1}^{\alpha} a_i/(\log \log x)^i + O(x/(\log \log x)^{\alpha+1}),$$

where $a_1 = \sum_p 1/p(p-1)$ and all the other a_i 's are computable constants.

PROOF. Let t and u be real numbers satisfying $|t| \leq 1$, $|u| \leq 1$. Then, for $\text{Re } s > 1$, we have

$$\begin{aligned} \sum_{n=1}^{\infty} \frac{t^{\Omega(n)} u^{\omega(n)}}{n^s} &= \prod_p \left(1 + \frac{tu}{p^s} + \frac{t^2 u}{p^{2s}} + \frac{t^3 u}{p^{3s}} + \cdots \right) \\ &= (\zeta(s))^{tu} \prod_p \left(1 - \frac{1}{p^s} \right)^{tu} \prod_p \left(1 + \frac{tu}{p^s} + \frac{t^2 u}{p^{2s}} + \frac{t^3 u}{p^{3s}} + \cdots \right) \\ &= (\zeta(s))^{tu} H(t, u; s), \end{aligned}$$

say (Here $\zeta(s)$ denotes the Riemann zeta-function.)

Using a theorem of A. Selberg [5], as we did previously in [1], we obtain that

$$\sum_{n \leq x} t^{\Omega(n)} u^{\omega(n)} = (H(t, u; 1)/\Gamma(tu)) x \log^{tu-1} x + O(x \log^{tu-2} x),$$

uniformly for $|t| \leq 1$, $|u| \leq 1$, which certainly implies that

$$\begin{aligned} \sum_{n \leq x} t^{\Omega(n)} u^{\omega(n)} &= \frac{H(t, u; 1)}{\Gamma(tu)} x \log^{tu-1} x + O(x/\log x) \\ (2) \quad &= \frac{x}{\log x} \left\{ \frac{H(t, u; 1)}{\Gamma(tu)} \log^{tu} x + O(1) \right\}, \end{aligned}$$

uniformly for $|t| \leq 1$, $|u| \leq 1$.

Now differentiating both sides of (2) with respect to t gives

$$\begin{aligned} \sum_{n \leq x} \Omega(n) t^{\Omega(n)-1} u^{\omega(n)} &= \frac{x}{\log x} \left\{ \log^{tu} x \frac{d}{dt} \left(\frac{H(t, u; 1)}{\Gamma(tu)} \right) \right. \\ &\quad \left. + \frac{H(t, u; 1)}{\Gamma(tu)} \cdot \log^{tu} x \cdot \log \log x \cdot u + O(1) \right\}, \end{aligned}$$

which, by setting $t=1$ and dividing both sides by u , becomes

$$\begin{aligned} \sum_{n \leq x} \Omega(n) u^{\omega(n)-1} \\ (3) \quad &= (x/\log x) \{ G(u) \log^u x + F(u) \log^u x \cdot \log \log x + O(1/u) \} \end{aligned}$$

uniformly for $|u| \leq 1$, where

$$G(u) = \frac{1}{u} \frac{d}{dt} \left(\frac{H(t, u; 1)}{\Gamma(tu)} \right) \Big|_{t=1}$$

and

$$F(u) = \frac{H(1, u; 1)}{\Gamma(u)}$$

We now proceed to integrate both sides of (3) with respect to u between $\varepsilon(x) = (\log x)^{-1/2}$ and 1 ($x \geq 3$). First we have

$$\begin{aligned} \int_{\varepsilon(x)}^1 \left(\sum_{2 \leq n \leq x} \Omega(n) u^{\omega(n)-1} \right) du &= \sum_{2 \leq n \leq x} \Omega(n) \int_{\varepsilon(x)}^1 u^{\omega(n)-1} du \\ &= \sum'_{n \leq x} \frac{\Omega(n)}{\omega(n)} - \sum'_{n \leq x} \frac{\Omega(n)}{\omega(n)} (\varepsilon(x))^{\omega(n)} \\ &= \sum'_{n \leq x} \frac{\Omega(n)}{\omega(n)} + O\left(\varepsilon(x) \sum_{2 \leq n \leq x} \Omega(n)\right), \end{aligned}$$

since $\omega(n) \geq 1$ for $n \geq 2$. It can be proved [4] in an elementary way that $\sum_{2 \leq n \leq x} \Omega(n) = O(x \log \log x)$. Therefore,

$$\begin{aligned} \int_{\varepsilon(x)}^1 \left(\sum_{2 \leq n \leq x} \Omega(n) u^{\omega(n)-1} \right) du &= \sum'_{n \leq x} \frac{\Omega(n)}{\omega(n)} + O(x(\log \log x)(\log x)^{-1/2}) \\ (4) \quad &= \sum'_{n \leq x} \frac{\Omega(n)}{\omega(n)} + O\left(\frac{x}{(\log \log x)^{\alpha+1}}\right). \end{aligned}$$

On the other hand, as in [1], repeated integration by parts yields

$$\begin{aligned} \int_{\varepsilon(x)}^1 G(u) \log^u x \, du &= \log x \left\{ \frac{G(1)}{\log \log x} - \frac{G'(1)}{(\log \log x)^2} + \frac{G''(1)}{(\log \log x)^3} - \dots \right. \\ &\quad \left. + \frac{(-1)^{\alpha-1} G^{(\alpha-1)}(1)}{(\log \log x)^{\alpha}} + O\left(\frac{1}{(\log \log x)^{\alpha+1}}\right) \right\} \\ (5) \quad &+ \frac{(-1)^{\alpha+1}}{(\log \log x)^{\alpha+1}} \int_{\varepsilon(x)}^1 G^{(\alpha+1)}(u) \log^u x \, du \\ &= \log x \left\{ \frac{G(1)}{\log \log x} - \frac{G'(1)}{(\log \log x)^2} + \dots \right. \\ &\quad \left. + \frac{(-1)^{\alpha-1} G^{(\alpha-1)}(1)}{(\log \log x)^{\alpha}} + O\left(\frac{1}{(\log \log x)^{\alpha+1}}\right) \right\}. \end{aligned}$$

Similarly we obtain

$$\begin{aligned} \log \log x \int_{\varepsilon(x)}^1 F(u) \log^u x \, du &= \log x \left\{ F(1) - \frac{F'(1)}{\log \log x} + \frac{F'(1)}{(\log \log x)^2} - \dots \right. \\ (6) \quad &+ \frac{(-1)^{\alpha} F^{(\alpha)}(1)}{(\log \log x)^{\alpha}} + O\left(\frac{1}{(\log \log x)^{\alpha+1}}\right) \left. \right\}. \end{aligned}$$

Finally,

$$(7) \quad \frac{x}{\log x} \int_{\varepsilon(x)}^1 \frac{du}{u} = O\left(\frac{x \log \varepsilon(x)}{\log x}\right) = O\left(\frac{x \log \log x}{\log x}\right) \\ = O\left(\frac{1}{(\log \log x)^{\alpha+1}}\right)$$

Putting together relations (3), (4), (5), (6) and (7), we have that

$$\sum_{n \leq x} \frac{\Omega(n)}{\omega(n)} = x \left\{ F(1) + \frac{G(1) - F'(1)}{\log \log x} - \frac{G'(1) - F''(1)}{(\log \log x)^2} + \cdots \right. \\ \left. + (-1)^{\alpha-1} \frac{G^{(\alpha-1)}(1) - F^{(\alpha)}(1)}{(\log \log x)^{\alpha}} + O\left(\frac{1}{(\log \log x)^{\alpha+1}}\right) \right\}$$

A quite simple computation shows that $F(1)=1$ and that $G(1)-F'(1)=\sum_p 1/p(p-1)$, which proves our Theorem.

From the above reasoning it is clear that similar estimates of $\sum'_{n \leq x} g(n)/f(n)$ could be obtained for a larger class of additive functions f and g along the lines of our previous paper [1].
