BOUNDEDNESS OF ADMISSIBLE AREA FUNCTION ON NONISOTROPIC LIPSCHITZ SPACE

JINSHOU GAO AND HOUYU JIA

(Communicated by Joseph A. Ball)

ABSTRACT. Let B be the unit ball in C^n , let S be the unit sphere, and let $S_\beta(f)$ be the admissible area function. In this paper, we show that if $f \in Lip_\alpha(S)$, then $S_\beta(f) \in Lip_\alpha(S)$ and there exists a constant C such that $\|S_\beta(f)\|_{Lip_\alpha} \leq C\|f\|_{Lip_\alpha}$.

1. INTRODUCTION

Let B be the unit ball in C^n , $d\nu$ the normalized Lebesgue measure on B , $d\sigma$ the normalized surface measure on the boundary S of B .

For $\xi \in S$ and $0 < \delta \leq 2$, let $Q_\delta(\xi) = \{\eta \in S : d(\xi, \eta) = |1 - \langle \xi, \eta \rangle| < \delta\}$ be a nonisotropic ball of S .

We denote by $f \in Lip_\alpha(S)$ the nonisotropic Lipschitz space of order $0 < \alpha < 1$ if

$$\sup_{\xi, \eta \in S} \frac{|f(\xi) - f(\eta)|}{d(\xi, \eta)^\alpha} := \|f\|_{Lip_\alpha} < \infty.$$

We shall follow the convention of identifying the function f on the unit sphere with invariant harmonic extensions into the unit ball defined via the Poisson formula:

$$f(z) = \int_S P(z, \xi) f(\xi) d\sigma(\xi),$$

where $P(z, \xi)$ is the Poisson-Szegö kernel

$$P(z, \xi) = \frac{(1 - |z|^2)^n}{|1 - \langle z, \xi \rangle|^{2n}}.$$

For $F \in C^1(B)$, let $DF = (\frac{\partial F}{\partial x_1}, \frac{\partial F}{\partial y_1}, \dots, \frac{\partial F}{\partial x_n}, \frac{\partial F}{\partial y_n})$ ($k = 1, 2, \dots, n$) be the real gradient of F and $\nabla F = (\frac{\partial F}{\partial z_1}, \frac{\partial F}{\partial z_2}, \dots, \frac{\partial F}{\partial z_n})$ the complex gradient of F , $z_k = x_k + iy_k$.

Let $\tilde{\nabla}$ denote the invariant gradient on B , that is,

$$\tilde{\nabla} f(z) = \nabla(f \circ \varphi_z)(0),$$

where φ_z is the involution automorphism of B satisfying $\varphi_z(0) = z, \varphi_z(z) = 0$. It has been shown in [1] that for $a \in B$,

$$\varphi_a(z) = \frac{a - P_a z - (1 - |a|^2)^{\frac{1}{2}} Q_a z}{1 - \langle z, a \rangle}$$

where $P_a z = \frac{\langle z, a \rangle}{|a|^2} a, P_0 z = 0, Q_a = I - P_a$ and

$$\varphi'_a(0) = -(1 - |a|^2)P_a - \sqrt{1 - |a|^2}Q_a.$$

Now, by a simple computation we get that

$$\begin{aligned} |\widetilde{\nabla} f(z)|^2 &= |\nabla(f \circ \varphi_z)(0)|^2 = |\nabla f(z)\varphi'_z(0)|^2 = |\varphi'_z(0)\nabla f(z)|^2 \\ &= (1 - |z|^2)^2 |P_{\bar{z}}\nabla f(z)|^2 + (1 - |z|^2) |Q_{\bar{z}}\nabla f(z)|^2 \\ (1.1) \quad &= (1 - |z|^2)(|\nabla f(z)|^2 - |\langle \nabla f(z), \bar{z} \rangle|^2) \\ &= (1 - |z|^2)(|\nabla f(z)|^2 - |Rf(z)|^2) \end{aligned}$$

where Rf is the radial derivative of f .

If $u \in C^1(B)$, the admissible area function is defined on S by

$$S_\beta u(\xi) = \left\{ \int_{D_\beta(\xi)} |\widetilde{\nabla} u|^2 (1 - |z|^2)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}}$$

where $D_\beta(\xi)$ denotes the admissible approach region with $\beta > 1$:

$$D_\beta(\xi) = \{z \in B : |1 - \langle z, \xi \rangle| < \frac{\beta}{2}(1 - |z|^2)\}.$$

In [2] S. Y. Chang proved the boundedness of S_β on L^p ($1 < p < +\infty$); P. Ahern and J. Bruna [3] studied the characterization of Hardy-Sobolev spaces by $S_\beta(f)$.

The aim of this paper is to study the behavior of $S_\beta(f)$ where $f \in Lip_\alpha(S)$ ($0 < \alpha < 1$).

Theorem 1.1. *If $f \in Lip_\alpha(S)$ ($0 < \alpha < 1$) and $S_\beta(f) < +\infty$ a.e. on S , then $S_\beta f \in Lip_\alpha(S)$ and there exists a constant C such that*

$$\|S_\beta(f)\|_{Lip_\alpha} \leq C\|f\|_{Lip_\alpha}.$$

Throughout this paper we shall use the letter C to denote constants, and it may change from line to line.

2. PRELIMINARIES

Lemma 2.1. *Let $z \in B, \xi \in S$. We have*

$$|\widetilde{\nabla} P(z, \xi)| \leq n \left(\frac{(1 - |z|^2)^n}{|1 - \langle z, \xi \rangle|^{2n}} + \frac{(1 - |z|^2)^{n+1}}{|1 - \langle z, \xi \rangle|^{2n+1}} + \frac{(1 - |z|^2)^{n+\frac{1}{2}}}{|1 - \langle z, \xi \rangle|^{2n+\frac{1}{2}}} \right).$$

Proof. Notice firstly that $P(z, \xi) = \bar{P}(z, \xi)$ and

$$|\widetilde{D}P(z, \xi)| = |\widetilde{\nabla} P(z, \xi)|.$$

To calculate $|\widetilde{\nabla} P(z, \xi)|$ we will use formula (1.1). We have

$$\nabla P(z, \xi) = -n \left(\frac{(1 - |z|^2)^{n-1}}{|1 - \langle z, \xi \rangle|^{2n}} \bar{z} - \frac{(1 - |z|^2)^n (1 - \overline{\langle z, \xi \rangle})}{|1 - \langle z, \xi \rangle|^{2n+2}} \bar{\xi} \right)$$

and

$$\begin{aligned} P_{\bar{z}} \nabla P(z, \xi) &= -n \left(\frac{(1 - |z|^2)^{n-1}}{|1 - \langle z, \xi \rangle|^{2n}} - \frac{(1 - |z|^2)^n (1 - \overline{\langle z, \xi \rangle}) \langle \bar{\xi}, \bar{z} \rangle}{|z|^2 |1 - \langle z, \xi \rangle|^{2n+2}} \right) \bar{z}, \\ Q_{\bar{z}} \nabla P(z, \xi) &= -n \frac{(1 - |z|^2)^n (1 - \overline{\langle z, \xi \rangle}) (|z|^2 \bar{\xi} - \langle \bar{\xi}, \bar{z} \rangle \bar{z})}{|z|^2 |1 - \langle z, \xi \rangle|^{2n+2}}. \end{aligned}$$

Hence

$$\begin{aligned} |\tilde{\nabla} P(z, \xi)| &\leq (1 - |z|^2) |P_{\bar{z}} \nabla P(z, \xi)| + (1 - |z|^2)^{\frac{1}{2}} |Q_{\bar{z}} \nabla P(z, \xi)| \\ &\leq n \left(\frac{(1 - |z|^2)^n}{|1 - \langle z, \xi \rangle|^{2n}} + \frac{(1 - |z|^2)^{n+1}}{|1 - \langle z, \xi \rangle|^{2n+1}} + \frac{(1 - |z|^2)^{n+\frac{1}{2}}}{|1 - \langle z, \xi \rangle|^{2n+\frac{1}{2}}} \right). \end{aligned}$$

□

The following lemma is well known; see [4].

Lemma 2.2. *Let $f \in L^1(S)$ and $0 < \alpha < 1$. Then the norm $\|f\|_{Lip_\alpha}$ is equivalent to*

$$\sup_Q \frac{1}{|Q|^{1+\frac{\alpha}{n}}} \int_Q |f - f_Q| d\sigma$$

where $f_Q = \frac{1}{|Q|} \int_Q f(\xi) d\sigma(\xi)$.

Lemma 2.3. *Let $f \in Lip_\alpha(S)$, $\gamma \geq 0$. Let Q_0 be a nonisotropic ball of radius $\delta > 0$ and center η^* . If $|1 - \langle \eta, \eta^* \rangle| < \frac{\delta}{16}$, then there exists a constant C depending only on n, γ so that for any $z \in B$ that satisfies $|1 - \langle z, \eta \rangle| < \frac{\delta}{16}$, we have*

$$\int_{S \setminus Q_0} \frac{|f(\xi) - f_{Q_0}|}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} d\sigma(\xi) \leq C \delta^{-(n+\gamma-\alpha)} \|f\|_{Lip_\alpha}.$$

Proof. For $\xi \in S \setminus Q_0$ and $z \in B$ that satisfies $|1 - \langle z, \eta \rangle| < \frac{\delta}{16}$, $|1 - \langle \eta, \eta^* \rangle| < \frac{\delta}{16}$, we have

$$\begin{aligned} |f(\xi) - f_{Q_0}| &\leq \frac{1}{|Q_0|} \int_{Q_0} |f(\xi) - f(\eta')| d\sigma(\eta') \\ &\leq \frac{1}{|Q_0|} \int_{Q_0} |1 - \langle \xi, \eta' \rangle|^\alpha d\sigma(\eta') \|f\|_{Lip_\alpha} \\ &\leq C |1 - \langle z, \xi \rangle|^\alpha \|f\|_{Lip_\alpha}. \end{aligned}$$

Hence

$$\begin{aligned} &\int_{S \setminus Q_0} \frac{|f(\xi) - f_{Q_0}|}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} d\sigma(\xi) \\ &\leq C \|f\|_{Lip_\alpha} \int_{S \setminus Q_0} \frac{1}{|1 - \langle z, \xi \rangle|^{2n+\gamma-\alpha}} d\sigma(\xi) \\ &\leq C \delta^{-(n+\gamma-\alpha)} \|f\|_{Lip_\alpha}. \end{aligned}$$

□

To be convenient, we denote $r(z) = (1 - |z|^2)$ ($z \in B$).

Lemma 2.4. *Let Q_0 be a nonisotropic ball of radius $\delta > 0$ and center η^* , let R be a nonisotropic ball of radius $r(z)$ and center at η^* , and let $f \in \text{Lip}_\alpha(S)$. Then*

$$(2.1) \quad |f_R - f_{Q_0}| \leq C(1 + |\ln[\frac{r(z)}{\delta}]|)r(z)^\alpha \|f\|_{\text{Lip}_\alpha} \quad (r(z) > \delta),$$

$$(2.2) \quad |f_R - f_{Q_0}| \leq C(1 + |\ln[\frac{r(z)}{\delta}]|)\delta^\alpha \|f\|_{\text{Lip}_\alpha} \quad (r(z) < \delta).$$

Proof. We only prove (2.1), the proof of (2.2) being similar.

Since $r(z) > \delta$, we choose k such that $2^k\delta < r(z) \leq 2^{k+1}\delta$. Then $\frac{2^{k+1}\delta}{r(z)} \leq 2$ and $k \leq \log_2 \frac{r(z)}{\delta}$, and

$$\begin{aligned} |f_R - f_{Q_0}| &= \left| \frac{1}{|R|} \int_R (f(\xi) - f_{Q_0}) d\sigma(\xi) \right| \\ &\leq C(r(z))^{-n} \int_R |f(\xi) - f_{Q_0}| d\sigma(\xi) \\ &\leq C(r(z))^{-n} \int_{Q_{k+1}} |f(\xi) - f_{Q_0}| d\sigma(\xi). \end{aligned}$$

As in the proof of Lemma 2.3 we have

$$\begin{aligned} \int_{Q_{k+1}} |f(\xi) - f_{Q_0}| d\sigma(\xi) &\leq C(k+2)|Q_{k+1}|^{1+\frac{\alpha}{n}} \|f\|_{\text{Lip}_\alpha} \\ &\leq C(k+2)2^{k+1}\delta^{n+\alpha} \|f\|_{\text{Lip}_\alpha}. \end{aligned}$$

Thus

$$\begin{aligned} |f_R - f_{Q_0}| &\leq C(k+2)2^{k+1}\delta^{n+\alpha} (r(z))^{-n} \|f\|_{\text{Lip}_\alpha} \\ &\leq C2^{n+\alpha} (2 + |\log_2[\frac{r(z)}{\delta}]|) (r(z))^\alpha \|f\|_{\text{Lip}_\alpha}. \end{aligned}$$

Since $1 + |\ln[\frac{r(z)}{\delta}]|$ is equivalent to $2 + |\log_2[\frac{r(z)}{\delta}]|$, (2.1) is proved, which completes the proof of the lemma. $\square$

Lemma 2.5. *Let R' be a nonisotropic ball of radius $4\alpha r(z)$ and center at η^* , and let $f \in \text{Lip}_\alpha(S)$. Then*

$$\int_S \frac{|f(\xi) - f_{R'}|}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} d\sigma(\xi) \leq C(r(z))^{-(n+\gamma-\alpha)} \|f\|_{\text{Lip}_\alpha}.$$

Proof. Argue as in the proof of Lemma 2.3. $\square$

Lemma 2.6. *Let Q_0 be a nonisotropic ball of radius δ and center at η^* . If $\frac{\beta}{2}r(z) \geq \frac{\delta}{16}$, $|1 - \langle \eta, \eta^* \rangle| < \frac{\delta}{16}$, $|1 - \langle z, \eta \rangle| < \frac{\beta}{2}r(z)$, we have*

$$\int_S \frac{|f(\xi) - f_{Q_0}|}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} d\sigma(\xi) \leq C(r(z))^{-(n+\gamma-\alpha)} (1 + |\ln[\frac{r(z)}{\delta}]|) \|f\|_{\text{Lip}_\alpha}.$$

Proof.

$$\int_S \frac{|f(\xi) - f_{Q_0}|}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} d\sigma(\xi) \leq \int_S \frac{|f(\xi) - f_{R'}|}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} d\sigma(\xi) + |f_{R'} - f_{Q_0}| \int_S \frac{d\sigma(\xi)}{|1 - \langle z, \xi \rangle|^{2n+\gamma}}.$$

By Lemma 2.4 and Lemma 2.5, we have

$$\begin{aligned} \int_S \frac{|f(\xi) - f_{R'}|}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} d\sigma(\xi) &\leq C(r(z))^{-(n+\gamma-\alpha)} \|f\|_{Lip_\alpha}, \\ |f_{R'} - f_{Q_0}| &\leq C(r(z))^\alpha (1 + |\ln[\frac{r(z)}{\delta}]|) \|f\|_{Lip_\alpha}. \end{aligned}$$

We also have (see [1, P17])

$$\int_S \frac{d\sigma(\xi)}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} \approx r(z)^{-(n+\gamma)}.$$

Hence

$$\begin{aligned} &\int_S \frac{|f(\xi) - f_{Q_0}|}{|1 - \langle z, \xi \rangle|^{2n+\gamma}} d\sigma(\xi) \\ &\leq C(r(z))^{-(n+\gamma-\alpha)} \|f\|_{Lip_\alpha} + C(r(z))^{-(n+\gamma-\alpha)} (1 + |\ln[\frac{r(z)}{\delta}]|) \|f\|_{Lip_\alpha} \\ &\leq C(r(z))^{-(n+\gamma-\alpha)} (1 + |\ln[\frac{r(z)}{\delta}]|) \|f\|_{Lip_\alpha}. \end{aligned}$$

□

3. THE PROOF OF THEOREM 1.1

Let $h_Q(\xi) = (f(\xi) - f_Q)\chi_{S \setminus Q}(\xi)$. To complete the proof of Theorem 1.1, we need the following theorem.

Theorem 3.1. *Let $f \in Lip_\alpha(\xi)$, let Q be a nonisotropic ball of radius δ and center at η^* , and let $\frac{1}{16}Q = \{\xi \in S : |1 - \langle \xi, \eta^* \rangle| < \frac{\delta}{16}\}$. Suppose that there is an $\eta' \in \frac{1}{16}Q$ so that $S_\beta(h_Q)(\eta') < \infty$. Then there exists a constant C , depending only on n and β , such that $S_\beta(h_Q)(\eta) < \infty$ and $|S_\beta(h_Q)(\eta) - S_\beta(h_Q)(\eta')| \leq C\delta^\alpha \|f\|_{Lip_\alpha}$ for all $\eta \in \frac{1}{16}Q$.*

Proof. Let $D_\beta^-(\eta) = D_\beta(\eta) \cap \{\frac{\beta r(z)}{2} \leq \frac{\delta}{16}\}$ and $D_\beta^+(\eta) = D_\beta(\eta) \cap \{\frac{\beta r(z)}{2} > \frac{\delta}{16}\}$.

We have

$$\begin{aligned} (3.1) \quad S_\beta(h_Q)(\eta) &= \left\{ \int_{D_\beta(\eta)} |\tilde{\nabla} \int_S P(z, \xi) h_Q(\xi) d\sigma(\xi)|^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\ &= \left\{ \int_{D_\beta^-(\eta)} |\tilde{\nabla} \int_S P(z, \xi) h_Q(\xi) d\sigma(\xi)|^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\ &\quad + \left\{ \int_{D_\beta^+(\eta)} |\tilde{\nabla} \int_S P(z, \xi) h_Q(\xi) d\sigma(\xi)|^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\ &= \left\{ \int_{D_\beta^-(\eta)} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\ &\quad + \left\{ \int_{D_\beta^+(\eta)} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\ &:= I_1 + I_2. \end{aligned}$$

By Lemma 2.1, we have

$$I_1 \leq n \left\{ \int_{D_{\beta}^-(\eta)} \left(\int_{S \setminus Q} \left(\frac{(1-|z|^2)^n}{|1-\langle z, \xi \rangle|^{2n}} + \frac{(1-|z|^2)^{n+1}}{|1-\langle z, \xi \rangle|^{2n+1}} + \frac{(1-|z|^2)^{n+\frac{1}{2}}}{|1-\langle z, \xi \rangle|^{2n+\frac{1}{2}}} \right) \right. \right. \\ \left. \left. \times |f(\xi) - f_Q| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}}.$$

If $z \in D_{\beta}^-(\eta)$, by Lemma 2.3, we get

$$\begin{aligned} \left(\int_{S \setminus Q} \frac{(1-|z|^2)^n}{|1-\langle z, \xi \rangle|^{2n}} |f(\xi) - f_Q| d\sigma(\xi) \right)^2 &\leq C(r(z))^{2n} \delta^{-2(n-\alpha)} \|f\|_{Lip_{\alpha}}^2, \\ \left(\int_{S \setminus Q} \frac{(1-|z|^2)^{n+1}}{|1-\langle z, \xi \rangle|^{2n+1}} |f(\xi) - f_Q| d\sigma(\xi) \right)^2 &\leq C(r(z))^{2n+2} \delta^{-2(n+1-\alpha)} \|f\|_{Lip_{\alpha}}^2, \\ \left(\int_{S \setminus Q} \frac{(1-|z|^2)^{n+\frac{1}{2}}}{|1-\langle z, \xi \rangle|^{2n+\frac{1}{2}}} |f(\xi) - f_Q| d\sigma(\xi) \right)^2 &\leq C(r(z))^{2n+1} \delta^{-2(n+\frac{1}{2}-\alpha)} \|f\|_{Lip_{\alpha}}^2. \end{aligned}$$

It follows that

$$\begin{aligned} I_1 &\leq C \left\{ \int_{D_{\beta}^-(\eta)} [(r(z))^{2n} \delta^{-2(n-\alpha)} + (r(z))^{2n+2} \delta^{-2(n+1-\alpha)} \right. \\ &\quad \left. + (r(z))^{2n+1} \delta^{-2(n+\frac{1}{2}-\alpha)}] r(z)^{-(n+1)} \|f\|_{Lip_{\alpha}}^2 d\nu(z) \right\}^{\frac{1}{2}} \\ &= C \left(\delta^{-2(n-\alpha)} \int_{D_{\beta}^-(\eta)} (r(z))^{n-1} d\nu(z) + \delta^{-2(n+1-\alpha)} \int_{D_{\beta}^-(\eta)} (r(z))^{n+1} d\nu(z) \right. \\ &\quad \left. + \delta^{-2(n+\frac{1}{2}-\alpha)} \int_{D_{\beta}^-(\eta)} (r(z))^n d\nu(z) \right)^{\frac{1}{2}} \|f\|_{Lip_{\alpha}} \\ &\leq C \left(\delta^{-2(n+1-2\alpha)} \int_{D_{\beta}^-(\eta)} d\nu(z) \right)^{\frac{1}{2}} \|f\|_{Lip_{\alpha}}. \end{aligned}$$

Arguing as in [2, P116], we get

$$\int_{D_{\beta}^-(\eta)} d\nu(z) \leq C\delta^{n+1}.$$

Hence

$$(3.2) \quad I_1 \leq C\delta^{\alpha} \|f\|_{Lip_{\alpha}}.$$

Next, we estimate I_2 :

$$\begin{aligned} I_2 &= \left\{ \int_{D_{\beta}^+(\eta)} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\ (3.3) \quad &\leq \left\{ \int_{D_{\beta}^+(\eta) \cap D_{\beta}(\eta')} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\ &\quad + \left\{ \int_{D_{\beta}^+(\eta) \setminus D_{\beta}(\eta')} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}}. \end{aligned}$$

For the first term above, we have

$$\begin{aligned}
 (3.4) \quad & \left\{ \int_{D_\beta^+(\eta) \cap D_\beta(\eta')} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\
 & \leq \left\{ \int_{D_\beta(\eta')} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\
 & = S_\beta(h_Q)(\eta').
 \end{aligned}$$

For the second term above, we have

$$\begin{aligned}
 & \left\{ \int_{D_\beta^+(\eta) \setminus D_\beta(\eta')} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\
 & \leq n \left\{ \int_{D_\beta^+(\eta) \setminus D_\beta(\eta')} \left(\int_{S \setminus Q} \left(\frac{(1 - |z|^2)^n}{|1 - \langle z, \xi \rangle|^{2n}} + \frac{(1 - |z|^2)^{n+1}}{|1 - \langle z, \xi \rangle|^{2n+1}} + \frac{(1 - |z|^2)^{n+\frac{1}{2}}}{|1 - \langle z, \xi \rangle|^{2n+\frac{1}{2}}} \right) \right. \right. \\
 & \quad \left. \left. \times |f(\xi) - f_Q| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}}.
 \end{aligned}$$

Using Lemma 2.6, it follows that

$$\begin{aligned}
 \left(\int_{S \setminus Q} \frac{(1 - |z|^2)^n}{|1 - \langle z, \xi \rangle|^{2n}} |f(\xi) - f_Q| d\sigma(\xi) \right)^2 & \leq C(r(z))^{2\alpha} (1 + |\ln[\frac{r(z)}{\delta}]|)^2 \|f\|_{Lip_\alpha}^2, \\
 \left(\int_{S \setminus Q} \frac{(1 - |z|^2)^{n+1}}{|1 - \langle z, \xi \rangle|^{2n+1}} |f(\xi) - f_Q| d\sigma(\xi) \right)^2 & \leq C(r(z))^{2\alpha} (1 + |\ln[\frac{r(z)}{\delta}]|)^2 \|f\|_{Lip_\alpha}^2, \\
 \left(\int_{S \setminus Q} \frac{(1 - |z|^2)^{n+\frac{1}{2}}}{|1 - \langle z, \xi \rangle|^{2n+\frac{1}{2}}} |f(\xi) - f_Q| d\sigma(\xi) \right)^2 & \leq C(r(z))^{2\alpha} (1 + |\ln[\frac{r(z)}{\delta}]|)^2 \|f\|_{Lip_\alpha}^2.
 \end{aligned}$$

Hence

$$\begin{aligned}
 & \left\{ \int_{D_\beta^+(\eta) \setminus D_\beta(\eta')} \left(\int_S |\tilde{\nabla} P(z, \xi)| |h_Q(\xi)| d\sigma(\xi) \right)^2 r(z)^{-(n+1)} d\nu(z) \right\}^{\frac{1}{2}} \\
 & \leq C \left\{ \int_{D_\beta^+(\eta) \setminus D_\beta(\eta')} (1 + |\ln[\frac{r(z)}{\delta}]|)^2 r(z)^{-(n+1-2\alpha)} \|f\|_{Lip_\alpha}^2 d\nu(z) \right\}^{\frac{1}{2}}.
 \end{aligned}$$

Notice that $|D_\beta^+(\eta) \setminus D_\beta(\eta') \cap \{r(z) = c'\}| \leq C\delta^n$ for all $0 < c' < 1$ (see [5, P128]) and $\frac{\beta r(z)}{2} > \frac{1}{16}\delta$. So we have $|D_\beta^+(\eta) \setminus D_\beta(\eta') \cap \{r(z) = c'\}| \leq C\delta(r(z))^{n-1}$. Thus it follows that

$$\begin{aligned}
 (3.5) \quad & \left\{ \int_{D_\beta^+(\eta) \setminus D_\beta(\eta')} (1 + |\ln[\frac{r(z)}{\delta}]|)^2 r(z)^{-(n+1-2\alpha)} \|f\|_{Lip_\alpha}^2 d\nu(z) \right\}^{\frac{1}{2}} \\
 & \leq C \int_{\frac{\delta}{8\beta}}^1 (1 + |\ln[\frac{r(z)}{\delta}]|)^2 \delta r(z)^{2\alpha-2} dr(z) \|f\|_{Lip_\alpha} \\
 & \leq C\delta^\alpha \int_{\frac{\delta}{8\beta}}^{+\infty} (1 + |\ln t|) t^{-2} dt \|f\|_{Lip_\alpha} \\
 & \leq C\delta^\alpha \|f\|_{Lip_\alpha}.
 \end{aligned}$$

Using (3.3)-(3.5), we have

$$(3.6) \quad I_2 \leq S_\beta(h_Q)(\eta') + C\delta^\alpha \|f\|_{Lip_\alpha}.$$

Combining (3.1) with (3.2), (3.6), it follows that

$$S_\beta(h_Q)(\eta) \leq S_\beta(h_Q)(\eta') + C\delta^\alpha \|f\|_{Lip_\alpha}.$$

Thus $S_\beta(h_Q)(\eta)$ is finite. Reversing the roles of η and η' , we obtain

$$|S_\beta(h_Q)(\eta) - S_\beta(h_Q)(\eta')| \leq C\delta^\alpha \|f\|_{Lip_\alpha}.$$

This completes the proof of Theorem 3.1. $\square$

The proof of Theorem 1.1. Write f as

$$\begin{aligned} f(\xi) &= f_Q + (f(\xi) - f_Q)\chi_Q(\xi) + (f(\xi) - f_Q)\chi_{S \setminus Q}(\xi) \\ (3.7) \quad &= f_Q(\xi) + g_Q(\xi) + h_Q(\xi). \end{aligned}$$

Since f_Q is a constant, $S_\beta(f_Q) = 0$. Thus $S_\beta(f_Q)$ is in Lip_α with the Lip_α norm equal to 0. Therefore

$$\begin{aligned} (3.8) \quad S_\beta(f) &\leq S_\beta(g_Q) + S_\beta(h_Q), \\ S_\beta(h_Q) &\leq S_\beta(g_Q) + S_\beta(f). \end{aligned}$$

By the boundedness of $S_\beta(f)$ on L^p ($1 < p < \infty$) and the Cauchy-Schwarz inequality, we have

$$\begin{aligned} (3.9) \quad \int_Q |S_\beta(g_Q)| d\sigma(\xi) &\leq |Q|^{\frac{1}{2}} \left(\int_Q |S_\beta(g_Q)|^2 d\sigma(\xi) \right)^{\frac{1}{2}} \\ &\leq C|Q|^{1+\frac{\alpha}{n}} \|f\|_{Lip_\alpha}. \end{aligned}$$

It also follows from (3.9) that $S_\beta(g_Q)$ is finite almost everywhere. Therefore $S_\beta(h_Q) < +\infty$ at almost every point such that $S_\beta(f) < +\infty$.

Now, we prove $\|S_\beta(f)\|_{Lip_\alpha} \leq C\|f\|_{Lip_\alpha}$.

To show the boundedness of S_β on Lip_α , by Lemma 2.2 and the triangle inequality, it suffices to show that for every $f \in Lip_\alpha(S)$, there is a constant $\lambda = \lambda(Q, f)$ such that

$$\frac{1}{|Q|^{1+\frac{\alpha}{n}}} \int_Q |S_\beta f(\xi) - \lambda| d\sigma(\xi) \leq C\|f\|_{Lip_\alpha}.$$

Let $Q' \subset S$ be any nonisotropic ball, and $Q = 16Q'$ (that is $Q' = \frac{1}{16}Q$). Since $S_\beta(h_Q)(\eta) < +\infty$ at almost every point, we choose a point $\eta' \in \frac{1}{16}Q$ so that $S_\beta(h_Q)(\eta')$ is finite. Then, by (3.9) and Theorem 3.1,

$$\begin{aligned} &\frac{1}{|Q'|^{1+\frac{\alpha}{n}}} \int_{Q'} |S_\beta f(\xi) - S_\beta(h_Q)(\eta')| d\sigma(\xi) \\ &= \frac{1}{|Q'|^{1+\frac{\alpha}{n}}} \int_{Q'} |S_\beta(g_Q + h_Q)(\xi) - S_\beta(h_Q)(\xi) + S_\beta(h_Q)(\xi) - S_\beta(h_Q)(\eta')| d\sigma(\xi) \\ &= \frac{1}{|Q'|^{1+\frac{\alpha}{n}}} \int_{Q'} |S_\beta(g_Q)(\xi)| d\sigma(\xi) + \frac{1}{|Q'|^{1+\frac{\alpha}{n}}} \int_{Q'} |S_\beta(h_Q)(\xi) - S_\beta(h_Q)(\eta')| d\sigma(\xi) \\ &\leq C\|f\|_{Lip_\alpha}. \end{aligned}$$

Since Q' is arbitrary, the proof is completed. $\square$

Remark 3.2. The referee asked whether the following proposition is true or not:

$$S_\alpha f \in Lip_\alpha(S) \Rightarrow f \in Lip_\alpha(S)??$$

The authors cannot give a positive proof right now.

ACKNOWLEDGEMENT

The authors express their gratitude to the referee for very valuable comments.
