THE AMENABILITY AND NON-AMENABILITY OF SKEW FIELDS

GÁBOR ELEK

(Communicated by Martin Lorenz)

ABSTRACT. We investigate the amenability of skew field extensions of the complex numbers. We prove that all skew fields of finite Gelfand-Kirillov transcendence degree are amenable. However there are both amenable and non-amenable finitely generated skew fields of infinite Gelfand-Kirillov transcendence degree.

1. INTRODUCTION

Definition 1.1. Let k be a commutative field and let $\mathcal{A}$ be a unital k -algebra. We say that $\mathcal{A}$ is amenable if for any finite subset $\{r_1, r_2, \dots, r_n\} \subset \mathcal{A}$ and real number $\epsilon > 0$ there exists a finite-dimensional k -subspace $V \subset \mathcal{A}$ such that

$$(1) \quad \frac{\dim_k (\sum_{i=1}^n r_i V)}{\dim_k V} < 1 + \epsilon.$$

In [5], we saw that the group algebra of an amenable group is amenable, and the group algebra of the free group of two generators is non-amenable. Any affine algebra of subexponential growth or any commutative algebra is amenable as well. It is easy to see that amenable algebras satisfy the invariant basis number property. In this paper, we investigate the amenability of skew field extensions. Our main result is the following theorem.

Theorem 1.

- (a) *If $k \subseteq D$ is a skew field that is finite dimensional over its center, then it is amenable.*
- (b) *If $k \subseteq D$ has finite Gelfand-Kirillov transcendence degree, then it is amenable.*
- (c) *There exist finitely generated amenable skew fields of infinite Gelfand-Kirillov transcendence degree.*
- (d) *If $k \subseteq D \subseteq E$ are skew fields and D is non-amenable, then E is non-amenable as well.*
- (e) *The free field of Cohn [4] is non-amenable.*

Key words and phrases. Skew fields, amenable algebras, Gelfand-Kirillov transcendence degree, von Neumann algebras.

In the course of the proof we shall see that $\mathbb{C}(\Gamma)$ is an amenable $\mathbb{C}$ -algebra if and only if Γ is an amenable group. The corresponding conjecture for general fields remains open.

2. THE ORE-PROPERTY AND AMENABILITY

Lemma 2.1. *If $\mathcal{A}$ is an amenable domain, then it has the left Ore-property that is for any non-zero $a, b \in \mathcal{A}$; $a\mathcal{A} \cap b\mathcal{A} \neq 0$.*

Proof. There exists a finite dimensional subspace $W \subseteq \mathcal{A}$ such that $\dim_k(aW \cap W) > \frac{1}{2} \dim_k(W)$ and $\dim_k(bW \cap W) > \frac{1}{2} \dim_k(W)$, hence $aW \cap bW \neq 0$. $\square$

Consequently, if $\mathcal{A}$ is an amenable domain, then one can consider its classical ring of quotient $\tilde{\mathcal{A}}$, a skew field.

Proposition 2.2. *If $\mathcal{A}$ is an amenable domain, then $\tilde{\mathcal{A}}$ is amenable as well.*

Proof. Let $x_1, x_2, \dots, x_m \in \tilde{\mathcal{A}}$. Then by the definition of the classical ring of quotient there exists a non-zero element $r \in \mathcal{A}$ such that $x_1r, x_2r, \dots, x_mr \in \mathcal{A}$. By the amenability of $\mathcal{A}$ there exists a sequence of finite-dimensional k -vector spaces $W_n \subseteq \mathcal{A}$, such that

$$(2) \quad \lim_{n \rightarrow \infty} \frac{\dim_k(\sum_{i=1}^m x_i r W_n)}{\dim_k(W_n)} = 1. \quad \square$$

Lemma 2.3. *Let $Z_n = \{v \in W_n : x_i r v \in W_n \text{ for all } i\}$. Then $\lim_{n \rightarrow \infty} \frac{\dim_k(Z_n)}{\dim_k(W_n)} = 1$.*

Proof. By (2), for any $1 \leq i \leq m$, $\lim_{n \rightarrow \infty} \frac{\dim_k(x_i r W_n \cap W_n)}{\dim_k(W_n)} = 1$. Hence if $Z_n^i = \{v \in W_n, x_i r v \in W_n\}$, then $\lim_{n \rightarrow \infty} \frac{\dim_k(Z_n^i)}{\dim_k(W_n)} = 1$. Since $Z_n = \bigcap_{i=1}^m Z_n^i$, the lemma follows.

Obviously, if $T_n = \{v \in W_n : rv \in W_n\}$, then $\lim_{n \rightarrow \infty} \frac{\dim_k(T_n)}{\dim_k(W_n)} = 1$. Thus if $S_n = T_n \cap Z_n$, then $\lim_{n \rightarrow \infty} \frac{\dim_k(S_n)}{\dim_k(W_n)} = 1$, and $\lim_{n \rightarrow \infty} \frac{\dim_k(rS_n)}{\dim_k(W_n)} = 1$. Now if $v \in rS_n$, then $v \in W_n$ and for any $1 \leq i \leq m$, $x_i v \in W_n$, that is, $rS_n \subseteq W_n$ and $x_i r S_n \subseteq W_n$. Since $\lim_{n \rightarrow \infty} \frac{\dim_k(W_n) - \dim_k(rS_n)}{\dim_k(W_n)} = 0$, it follows that

$$\lim_{n \rightarrow \infty} \frac{\dim_k(\sum_{i=1}^m x_i W_n)}{\dim_k(W_n)} = 1,$$

proving the amenability of $\tilde{\mathcal{A}}$. $\square$

Note that by our previous proposition the classical ring of fraction of the Weyl-algebras are amenable. Let us recall the notion of the Gelfand-Kirillov transcendence degree [6].

Definition 2.4. Let D be a skew field extension of the commutative field k . Then

$$GK - \text{tr deg}(D) = \sup_V \inf_{0 \neq r} \limsup_{n \rightarrow \infty} \frac{\log \dim_k((k + Vr)^n)}{\log n},$$

where V runs through all the finite dimensional subspaces of D containing the unit.

Note that $GK - \text{tr deg}(D) < \infty$ if and only if there exists a $d > 0$ with the following property: For any $c_1, c_2, \dots, c_m \in D$ there exists $r \in D$ such that the affine algebra generated by $1, c_1r, c_2r, \dots, c_mr$ has polynomial growth with Gelfand-Kirillov dimension not greater than d .

Proposition 2.5. *If D has finite Gelfand-Kirillov transcendence degree, then D is amenable.*

Proof. We prove that if for any subset $c_1, c_2, \dots, c_m \in D$ there exists $r \in D$ such that $1, c_1r, c_2r, \dots, c_mr$ generate an amenable domain, then D is amenable. Indeed, if

$$\lim_{n \rightarrow \infty} \frac{\dim_k \left(\sum_{i=1}^m c_i r W_n \right)}{\dim_k(W_n)} = 1,$$

then

$$\lim_{n \rightarrow \infty} \frac{\dim_k \left(\sum_{i=1}^m c_i V_n \right)}{\dim_k(V_n)} = 1,$$

where $V_n = rW_n$. Thus D is in fact amenable. $\square$

Note however, that Aizenbud proved in [1] that for some poly-cyclic groups Γ the classical ring of quotient of the group algebra $k(\Gamma)$ has infinite Gelfand-Kirillov transcendence degree. Since such groups are amenable, these finitely generated skew fields above are amenable as well.

Also, since all affine commutative algebras and all matrix algebras over such algebras are of polynomial growth, we have the following corollary:

Proposition 2.6. *If $k \subseteq L$ is finite dimensional over its center, then L is amenable.*

The class of amenable skew fields are closed under some operations:

Proposition 2.7.

- (a) *The direct limit of amenable skew fields is amenable.*
- (b) *If $k \subseteq D$ and any finitely generated subskewfield $E \subseteq D$ is amenable, then D is amenable as well.*
- (c) *If A and B are amenable skew fields and $A \otimes_k B$ is a domain, then $A \otimes_k B$ is amenable, hence by Proposition 2.2 $\widehat{A \otimes_k B}$ is also an amenable skew field.*

Proof. Parts (a) and (b) are easy exercises; for (c), let us consider the amenable k -algebras A and B . It is enough to prove that if $a_1, a_2, \dots, a_l \in A, b_1, b_2, \dots, b_m \in B$, then there exists a sequence of finite-dimensional subspaces $\{V_n\} \subseteq A \otimes_k B$ such that

$$\lim_{n \rightarrow \infty} \frac{\dim_k \left(\sum_{i=1}^l \sum_{j=1}^m (a_i \otimes b_j) V_n \right)}{\dim_k(V_n)} = 1.$$

Let $\{W_n\} \subseteq A, \{Z_n\} \subseteq B$ be sequences of finite-dimensional subspaces such that

$$\lim_{n \rightarrow \infty} \frac{\dim_k \left(\sum_{i=1}^l a_i W_n \right)}{\dim_k(W_n)} = 1$$

and

$$\lim_{n \rightarrow \infty} \frac{\dim_k \left(\sum_{j=1}^m b_j Z_n \right)}{\dim_k(Z_n)} = 1.$$

Set $V_n = W_n \otimes Z_n$. Then

$$\left(\sum_{i=1}^l \sum_{j=1}^m (a_i \otimes b_j) V_n \right) \subseteq \left(\sum_{i=1}^l a_i W_n \right) \otimes \left(\sum_{j=1}^m b_j Z_n \right),$$

hence the proposition follows. $\square$

3. NON-AMENABLE SUBSKEWFIELDS

Proposition 3.1. *Let $k \subseteq D \subseteq E$ be skewfields. Suppose that D is non-amenable; then E is non-amenable as well.*

Proof. If D is non-amenable, then there exists $\alpha > 1$ and $g_1, g_2, \dots, g_l \in D$ such that for any finite-dimensional k -subspace $W \subseteq D$

$$(3) \quad \dim_k \left(\sum_{i=1}^l g_i W \right) \geq \alpha \dim_k(W).$$

It is enough to prove that for any $m \geq 1$ and any finite-dimensional k -subspace Z of the m -dimensional left D -module $\bigoplus_{j=1}^m D$,

$$(4) \quad \dim_k \left(\sum_{i=1}^l g_i Z \right) \geq \alpha \dim_k(Z).$$

We proceed by induction. The $m = 1$ case is just (3). Suppose that (4) holds for $m = 1, 2, \dots, n$. Let $Z \subseteq \bigoplus_{j=1}^{n+1} D$ and let $\pi^{n+1}: \bigoplus_{j=1}^{n+1} D \rightarrow D$ be the projection onto the last coordinate. If $\dim_k(\pi^{n+1}(Z)) = \dim_k(Z)$, then

$$\dim_k \left(\sum_{j=1}^l g_j Z \right) = \dim_k \left(\sum_{j=1}^l g_j (\pi^{n+1}(Z)) \right) \geq \alpha \dim_k(Z).$$

If $\dim_k(\pi^{n+1}(Z)) < \dim_k(Z)$, then $Z = Z_1 \oplus Z_2$ as k -subspaces, where $Z_1 \subseteq \bigoplus_{j=1}^n D$ and $\dim_k(\pi^{n+1}(Z)) = \dim_k(Z_2)$. Let $v_1, v_2, \dots, v_{s_1}$ be a k -basis for Z_1 and let $w_1, w_2, \dots, w_{s_2}$ be a k -basis for Z_2 . Let G be the k -vector space generated by $\{g_1, g_2, \dots, g_l\}$. Then by the inductual hypothesis, there exist elements

$$\begin{aligned} g_j^i &\in G, \quad 1 \leq i \leq t_1, \quad 1 \leq j \leq s_1, \\ h_j^i &\in G, \quad 1 \leq i \leq t_2, \quad 1 \leq j \leq s_2, \end{aligned}$$

such that $t_1 \geq \alpha s_1$, $t_2 \geq \alpha s_2$, and

$$\left\{ z_i = \sum_{j=1}^{s_1} g_j^i v_j \right\}_{i=1,2,\dots,t_1}$$

and

$$\left\{ z'_i = \sum_{j=1}^{s_2} h_j^i \pi^{n+1}(w_j) \right\}_{i=1,2,\dots,t_2}$$

are both independent systems of vectors in $\bigoplus_{i=1}^n D$, resp. $\pi^{n+1}(\bigoplus_{i=1}^{n+1} D)$. Then $\{z_i = \sum_{j=1}^{s_1} g_j^i v_j\} \cup \{z'_i = \sum_{j=1}^{s_2} h_j^i \pi^{n+1}(w_j)\}$ form an independent system of more than $\alpha \cdot \dim_k(Z)$ elements, proving (4) for the subspace $Z \subseteq \bigoplus_{j=1}^{n+1} D$. $\square$

4. THE CONSTRUCTION OF A NON-AMENABLE SKEW FIELD

Definition 4.1. Let Γ be a discrete group and let V be a vector space over k . A representation $\phi: \Gamma \rightarrow GL(V)$ is called algebraically amenable, if for any

$g_1, g_2, \dots, g_m \in \Gamma$ and $\epsilon > 0$ there exists a finite-dimensional vector space $W \subseteq V$ such that

$$\frac{\dim_k(\sum_{i=1}^m g_i W)}{\dim_k(W)} \leq 1 + \epsilon.$$

Note that if $\mathcal{A}$ is an amenable k -algebra, then the group of invertible elements of $\mathcal{A}$ acts on $\mathcal{A}$ in an algebraically amenable fashion. We should observe that the group of non-zero elements of an amenable skew field can in fact be a non-amenable group. As a matter of fact it is Lichtman's conjecture that any skew field which is infinite dimensional over its center contains a free group of two generators. By the result of Makar-Limanov [10] the first Weyl skew field even contains a free group algebra as a subalgebra.

Proposition 4.2. *Let Γ be a countable group represented by unitary transformations on a Hilbert-space $\mathcal{H}$. If the representation is algebraically amenable, then it is amenable in the sense of Bekka [2], that is, there exists a linear map $\tau: B(\mathcal{H}) \rightarrow \mathbb{C}$ from the space of bounded linear operators to the complex numbers such that $\tau(Id) = 1$ and*

$$\tau(A) = \tau(g^{-1}Ag),$$

for any $A \in B(\mathcal{H})$, $g \in \Gamma$.

Proof. By our assumption, there exists a sequence of finite-dimensional subspaces $W_n \subseteq \mathcal{H}$, $n \geq 1$, such that for any $g \in \Gamma$,

$$\lim_{n \rightarrow \infty} \frac{\dim_{\mathbb{C}}(gW_n + W_n)}{\dim_{\mathbb{C}}(W_n)} = 1.$$

Let P_n denote the orthogonal projection onto W_n . Then for any $A \in B(\mathcal{H})$,

$$\frac{Tr(P_n A P_n)}{\dim_{\mathbb{C}}(W_n)}$$

is a sequence of complex numbers bounded by the norm of A . Hence one can consider

$$\tau(A) = \lim_{\omega} \frac{Tr(P_n A P_n)}{\dim_{\mathbb{C}}(W_n)},$$

where ω is an ultrafilter on the natural numbers and $\lim_{\omega}$ is the corresponding ultralimit. Then the map $\tau: B(\mathcal{H}) \rightarrow \mathbb{C}$ is clearly bounded and linear. In order to prove that $\tau(A) = \tau(gAg^{-1})$, it is enough to see that for any $g \in \Gamma$ and $A \in B(\mathcal{H})$,

$$\lim_{n \rightarrow \infty} \frac{Tr(P_n A P_n) - Tr(P_n g^{-1} A g P_n)}{\dim_{\mathbb{C}}(W_n)} = 0.$$

Let $G_n = g^{-1}(gW_n \cap W_n)$. Then $\lim_{n \rightarrow \infty} \frac{\dim_{\mathbb{C}}(G_n)}{\dim_{\mathbb{C}}(W_n)} = 1$ and both G_n and gG_n are subspaces of W_n . Pick an orthonormal basis $\{v_1, v_2, \dots, v_{k_n}\}$ for G_n and extend it to an orthonormal basis for the whole W_n by adding $w_1, w_2, \dots, w_{l_n}$, where $k_n = \dim_{\mathbb{C}}(G_n)$, $l_n = \dim_{\mathbb{C}}(W_n) - \dim_{\mathbb{C}}(G_n)$.

Let g_n be a unitary transformation on W_n such that $g_n|_{G_n} = g$. Define g_n to be the identity transformation on $W_n^{\perp}$. Then

$$(5) \quad Tr(P_n g_n^{-1} A g_n P_n) = Tr(P_n A P_n).$$

Indeed, g_n commutes with P_n , hence

$$Tr(P_n g_n^{-1} A g_n P_n) = Tr(g_n^{-1} P_n A P_n g_n)$$

and

$$\text{Tr}(g_n^{-1}P_nAP_ng_n) = \text{Tr}(P_nAP_n)$$

by the property of the trace. $\square$

Lemma 4.3.

$$\lim_{n \rightarrow \infty} \frac{\text{Tr}(P_ng_n^{-1}Ag_nP_n) - \text{Tr}(P_ng^{-1}AgP_n)}{\dim_{\mathbb{C}}(W_n)} = 0.$$

Proof. Note that

$$\begin{aligned} \text{Tr}(P_ng^{-1}AgP_n) &= \sum_{i=1}^{k_n} \langle g^{-1}Ag(v_i), v_i \rangle + \sum_{i=1}^{l_n} \langle g^{-1}Ag(w_i), w_i \rangle \\ &= \sum_{i=1}^{k_n} \langle Ag(v_i), g(v_i) \rangle + \sum_{i=1}^{l_n} \langle Ag(w_i), g(w_i) \rangle. \end{aligned}$$

Similarly,

$$\text{Tr}(P_ng_n^{-1}Ag_nP_n) = \sum_{i=1}^{k_n} \langle Ag_n(v_i), g_n(v_i) \rangle + \sum_{i=1}^{l_n} \langle Ag_n(w_i), g_n(w_i) \rangle.$$

Since $g_n(v_i) = g(v_i)$, we have the following estimate:

$$\begin{aligned} &|\text{Tr}(P_ng_n^{-1}Ag_nP_n) - \text{Tr}(P_ng^{-1}AgP_n)| \\ &\leq \sum_{i=1}^{l_n} (|\langle Ag_n(w_i), g_n(w_i) \rangle| + |\langle Ag(w_i), g(w_i) \rangle|) \leq 2\|A\| \cdot l_n. \end{aligned}$$

Therefore the lemma follows from the fact that

$$\lim_{n \rightarrow \infty} \frac{l_n}{\dim_{\mathbb{C}}(W_n)} = 0. \quad \square$$

Consequently, by the Lemma 4.3 and (5) we can see that $\tau(A) = \tau(g^{-1}Ag)$.

Proposition 4.4. *If Γ is a countable group, then $\mathbb{C}(\Gamma)$ is amenable as a $\mathbb{C}$ -algebra if and only if Γ is an amenable group. Moreover Γ acts on $l^2(\Gamma)$ in an algebraically amenable fashion if and only if Γ is an amenable group.*

Proof. If Γ is amenable, then $k(\Gamma)$ is amenable for any field k [5]. Now, let us suppose that Γ is non-amenable. If $\mathbb{C}(\Gamma)$ were amenable, then the natural representation of Γ on $\mathbb{C}(\Gamma)$ would be algebraically amenable. Therefore the natural representation of Γ by translations on the Hilbert-space $l^2(\Gamma)$ must be algebraically amenable as well. By our previous proposition, there exists a bounded linear functional $\tau: B(l^2(\Gamma)) \rightarrow \mathbb{C}$ such that $\tau(A) = \tau(g^{-1}Ag)$, for any $A \in B(\mathcal{H})$, $g \in \Gamma$. Consider the commutative C^* -algebra $l^\infty(\Gamma) \subseteq B(l^2(\Gamma))$ acting on $l^2(\Gamma)$ by point-wise multiplication. That is, if $f \in l^\infty(\Gamma)$, $G \in l^2(\Gamma)$,

$$T_f(G)(\delta) = f(\delta)G(\delta).$$

The group Γ acts on both $l^\infty(\Gamma)$ and $l^2(\Gamma)$ by translations:

$$(\gamma f)(\delta) = f(\gamma^{-1}\delta). \quad \square$$

Lemma 4.5.

$$T_{\gamma f} = \gamma \circ T_f \circ \gamma^{-1}.$$

Proof. Let $1_\delta \in l^2(\Gamma)$ be the function which vanishes everywhere except at δ where it takes the value 1. Then $\gamma^{-1}(1_\delta) = 1_{\gamma^{-1}\delta}$ and $(T_f \circ \gamma^{-1})(1_\delta) = f(\gamma^{-1}\delta) \cdot 1_{\gamma^{-1}\delta}$. Thus $(\gamma \circ T_f \circ \gamma^{-1})(1_\delta) = f(\gamma^{-1}\delta)1_\delta$.

On the other hand, $T_{\gamma f}(1_\delta) = (\gamma f)(\delta) \cdot 1_\delta = f(\gamma^{-1}\delta)1_\delta$.

Hence, τ would define a translation invariant linear functional on $l^\infty(\Gamma)$, which takes the value 1 on the constant one function. This is in contradiction with the non-amenability of the group Γ . Thus our proposition holds. $\square$

Remark. At the 2003 Gaeta Conference, Zelmanov mentioned the following conjecture: If a discrete group of Kazhdan's property (T) is represented on an infinite-dimensional vector space without a finite-dimensional invariant subspace, then the representation is not algebraically amenable.

If the action in the conjecture is in fact unitary, then by the result of [3], the representation cannot be amenable in the sense of Bekka. Hence by Proposition 4.2, Zelmanov's conjecture holds for unitary representations.

Now, we are in the position to construct the non-amenable skew field. Let us consider the von Neumann algebra $W(\mathbb{F}_2)$ of the free group of two generators. The algebra $W(\mathbb{F}_2)$ satisfies the Ore-condition with respect to its non-zero divisors and thus it imbeds in the ring of affiliated operators $U(\mathbb{F}_2)$. By Lemma 10.51 of [9] there exists a skew field $D(\mathbb{F}_2)$ such that $\mathbb{C}(\mathbb{F}_2) \subseteq D(\mathbb{F}_2) \subseteq U(\mathbb{F}_2)$, namely the division closure of $\mathbb{C}(\mathbb{F}_2)$ in $U(\mathbb{F}_2)$.

Proposition 4.6. *$D(\mathbb{F}_2)$ is a non-amenable skew field.*

Proof. Recall [9] that the von Neumann algebra can be identified with the dense linear subspace of $l^2(\mathbb{F}_2)$ consisting of those vectors $w \in l^2(\mathbb{F}_2)$ such that the convolution by w defines a bounded operator on $l^2(\Gamma)$. Thus the natural action of the group $\mathbb{F}_2$ on the vector space $W(\mathbb{F}_2)$ must be non-amenable. Since $\mathbb{C}(\mathbb{F}_2) \subseteq D(\mathbb{F}_2) \subseteq U(\mathbb{F}_2)$, it is enough to prove that the action of $\mathbb{F}_2$ on $U(\mathbb{F}_2)$ is not algebraically amenable. Let $V_n \subseteq U(\mathbb{F}_2)$ be a sequence of linear subspaces such that for any $g \in \mathbb{F}_2$,

$$\lim_{n \rightarrow \infty} \frac{\dim_{\mathbb{C}}(gV_n + V_n)}{\dim_{\mathbb{C}}(V_n)} = 1.$$

Then by the Ore-property, there exists non-zero divisors $s_n \in W(\mathbb{F}_2)$ such that $V_n s_n \subseteq W(\mathbb{F}_2)$. Then

$$\lim_{n \rightarrow \infty} \frac{\dim_{\mathbb{C}}(gV_n s_n + V_n s_n)}{\dim_{\mathbb{C}}(V_n s_n)} = 1.$$

This would mean the action of $\mathbb{F}_2$ on $W(\mathbb{F}_2)$ is algebraically amenable, leading to a contradiction. $\square$

Linnell [8] proved that $D(\mathbb{F}_2)$ is the free field. This finishes the proof of our Theorem 1.
