ON TURÁN TYPE INEQUALITIES FOR MODIFIED BESSEL FUNCTIONS

ÁRPÁD BARICZ AND SAMINATHAN PONNUSAMY

(Communicated by Sergei K. Suslov)

ABSTRACT. In this note our aim is to point out that certain inequalities for modified Bessel functions of the first and second kind, deduced recently by Laforgia and Natalini, are in fact equivalent to the corresponding Turán type inequalities for these functions. Moreover, we present some new Turán type inequalities for the aforementioned functions and we show that their product is decreasing as a function of the order, which has an application in the study of stability of radially symmetric solutions in a generalized FitzHugh-Nagumo equation in two spatial dimensions. At the end of this note an open problem is posed, which may be of interest for further research.

1. SOME INEQUALITIES FOR MODIFIED BESSEL FUNCTIONS

Let us denote with I_ν and K_ν the modified Bessel functions of the first and second kind, respectively. For definitions, recurrence formulas and other properties of modified Bessel functions of the first and second kind we refer to the classical book of Watson [35].

In 2007, motivated by a problem which arises in biophysics, Penfold et al. [31] proved that the product of the modified Bessel functions of the first and second kind, i.e. $u \mapsto P_\nu(u) = I_\nu(u)K_\nu(u)$, is strictly decreasing on $(0, \infty)$ for all $\nu \geq 0$. It is worth mentioning that this result for $\nu = n \geq 1$, a positive integer, was verified in 1950 by Phillips and Malin [32]. In order to shorten the proof due to Penfold et al. [31], recently the first author [5] pointed out that the Turán type inequalities for modified Bessel functions of the first and second kinds are in fact equivalent to some known inequalities for the logarithmic derivatives of the functions in question. For the reader's convenience we recall here the historical facts for these Turán type inequalities (see [5, 8] for more details). More precisely, in view of the recurrence relations

$$(1) \quad I_{\nu-1}(u) = (\nu/u)I_\nu(u) + I'_\nu(u)$$

and

$$I_{\nu+1}(u) = I'_\nu(u) - (\nu/u)I_\nu(u),$$

the Turán type inequality

$$(2) \quad I_{\nu-1}(u)I_{\nu+1}(u) - [I_\nu(u)]^2 < 0$$

Received by the editors April 23, 2010 and, in revised form, June 28, 2011.

Key words and phrases. Modified Bessel functions, Turán-type inequalities, completely monotonic functions.

is equivalent to

$$(3) \quad uI'_\nu(u)/I_\nu(u) < \sqrt{u^2 + \nu^2},$$

where $\nu > -1$ and $u > 0$. To the best of the authors' knowledge the Turán type inequality (2) for $\nu > -1$ was proved first in 1951 by Thiruvengatachar and Nanjundiah [34] and later in 1974 by Amos [1, p. 243] for $\nu \geq 0$. In 1991 Joshi and Bissu [24] proved also (2) for $\nu \geq 0$, while in 1994 Lorch [27] proved that (2) in fact holds for all $\nu \geq -1/2$ and $u > 0$. Recently, the first author [8] reconsidered the proof of Joshi and Bissu [24] and pointed out that (2) and (3) hold true for all $\nu > -1$ and that the constant zero on the right-hand side of (2) is the best possible. It is worth mentioning that in fact the function $\nu \mapsto I_\nu(u)$ is log-concave on $(-1, \infty)$ for each fixed $u > 0$, as was pointed out by Baricz [7]. Finally, we note that the inequality (3) for $\nu > 0$ was first proved by Gronwall [13] in 1932, motivated by a problem in wave mechanics. This inequality in 1950 appeared also in Phillips and Malin's paper [32] for $\nu = n \geq 1$, a positive integer.

Similarly, by using the recurrence relations

$$(4) \quad K_{\nu-1}(u) = -(\nu/u)K_\nu(u) - K'_\nu(u)$$

and

$$(5) \quad K_{\nu+1}(u) = -K'_\nu(u) + (\nu/u)K_\nu(u),$$

it is easy to prove (see [5, 8]) that the Turán type inequality

$$(6) \quad K_{\nu-1}(u)K_{\nu+1}(u) - [K_\nu(u)]^2 > 0$$

is equivalent to

$$(7) \quad uK'_\nu(u)/K_\nu(u) < -\sqrt{u^2 + \nu^2},$$

where $\nu \in \mathbb{R}$ and $u > 0$. The Turán type inequality (6) was proved in 1978 by Ismail and Muldoon [23] and recently by the first author (see [7, 8]) by using different methods. The constant zero on the right-hand side of (6) is the best possible. Note that for $\nu > 1/2$ the Turán type inequality (6) appears also on Laforgia and Natalini's paper [25]. It is also worth mentioning here that Ismail and Muldoon [23], by using the Nicholson formula concerning the product of two modified Bessel functions of different order, proved that [23] the function $\nu \mapsto K_{\nu+a}(u)/K_\nu(u)$ is increasing on $\mathbb{R}$ for each fixed $u > 0$ and $a > 0$. As Muldoon [30] pointed out, this implies that $\nu \mapsto K_\nu(u)$ is log-convex on $\mathbb{R}$ for each fixed $u > 0$. Recently, by using the Hölder-Rogers inequality, the first author [7] pointed out that the function $\nu \mapsto K_\nu(u)$ is in fact strictly log-convex on $\mathbb{R}$ for each fixed $u > 0$. Finally, we note that the inequality (7) was proved for $\nu = n \geq 1$, a positive integer, by Phillips and Malin [32] in 1950.

Recently, motivated by some applications in finite elasticity, Laforgia and Natalini [26] proved the following inequalities:

$$(8) \quad \frac{I_\nu(u)}{I_{\nu-1}(u)} > \frac{-\nu + \sqrt{u^2 + \nu^2}}{u}$$

and

$$(9) \quad \frac{K_\nu(u)}{K_{\nu-1}(u)} < \frac{\nu + \sqrt{u^2 + \nu^2}}{u},$$

where $u > 0$ and $\nu \geq 0$ in the first inequality, and $u > 0$ and $\nu \in \mathbb{R}$ in the second inequality. However, inequality (8) is not new; as far as we know it was proved first by Amos [1] in 1974. It is important to note here that Laforgia and Natalini in order to deduce (8) and (9) used the Turán type inequalities (2) and (6). Moreover, inequality (8) improves a recently deduced inequality by the first author [6], which is useful in the study of the generalized Marcum Q -function applied frequently in radar signal processing. See [6, 26] for more details and also [2, 3, 4, 7, 8, 24, 25, 27, 34] for more details on Turán type inequalities.

Here our aim is to show that the inequalities (8) and (9) are in fact equivalent to the corresponding Turán type inequalities (2) and (6). To see this we just need to rewrite the inequality (3), by using (1), in the following form:

$$\frac{I_{\nu-1}(u)}{I_\nu(u)} < \frac{\nu + \sqrt{u^2 + \nu^2}}{u},$$

which is actually equivalent to (8). Thus, the inequalities (2), (3) and (8) are equivalent and hold true for all $\nu > -1$ and $u > 0$. Similarly, in view of (4), the inequality (7) is equivalent to

$$\frac{K_{\nu-1}(u)}{K_\nu(u)} > \frac{-\nu + \sqrt{u^2 + \nu^2}}{u},$$

which is in fact equivalent to (9). Thus, the inequalities (6), (7) and (9) are equivalent.

Moreover, by using the corresponding counterparts of the Turán type inequalities (2) and (6) (or inequalities (3) and (7)), we can obtain in a similar way the corresponding counterparts of inequalities (8) and (9). More precisely, consider the Turán type inequalities

$$(10) \quad I_\nu^2(u) - I_{\nu-1}(u)I_{\nu+1}(u) < I_\nu^2(u)/(\nu + 1)$$

and

$$(11) \quad K_\nu^2(u) - K_{\nu-1}(u)K_{\nu+1}(u) > K_\nu^2(u)/(1 - \nu).$$

Inequality (10), which holds for all $\nu > -1$ and $u > 0$, was proved using different arguments in 1951 by Thiruvengatachar and Nanjundiah [34] for $\nu > -1$, in 1991 by Joshi and Bissu [24] for $\nu \geq 0$, and recently by the first author [4, 8] for $\nu > -1$. Note that the constant $1/(\nu + 1)$ on the right-hand side of (10) is the best possible, as was pointed out recently in [8]. The Turán type inequality (11), which holds for all $\nu > 1$ and $u > 0$, was proved recently in [8]. We note that the constant $1/(1 - \nu)$ on the right-hand side of (11) is the best possible.

Now, consider the corresponding counterparts of (3) and (7), namely

$$(12) \quad uI'_\nu(u)/I_\nu(u) > \sqrt{u^2\nu/(\nu + 1) + \nu^2}$$

and

$$(13) \quad uK'_\nu(u)/K_\nu(u) > -\sqrt{u^2\nu/(\nu - 1) + \nu^2}.$$

The inequality (12) is equivalent to (10) and holds true for all $\nu > -1$ and $u > 0$, as was pointed out in [5]. This inequality appears also in Phillips and Malin's paper [32] for $\nu = n \geq 1$, a positive integer. The inequality (13) is valid for all $\nu > 1$ and $u > 0$. For $\nu = n > 1$, a positive integer, it was proved by Phillips and Malin [32], and for $\nu > 1$ by the first author [8]. Note that (13) is equivalent to (11), which can

be verified by using the corresponding recurrence relations for the modified Bessel function of the second kind, mentioned above.

Now, our aim is to show that by using the same argument as in the proof of (8) and (9) we can obtain easily the counterparts of (8) and (9). Namely, by using (1) we conclude that (10) or (12) is equivalent to

$$(14) \quad \frac{I_\nu(u)}{I_{\nu-1}(u)} < \frac{-\nu + \sqrt{\frac{\nu}{\nu+1}u^2 + \nu^2}}{\frac{\nu}{\nu+1}u},$$

which holds for all $u > 0$ and all $\nu > 0$. Similarly, in view of (4), we conclude that (11) or (13) is equivalent to

$$(15) \quad \frac{K_\nu(u)}{K_{\nu-1}(u)} > \frac{\nu + \sqrt{\frac{\nu}{\nu-1}u^2 + \nu^2}}{\frac{\nu}{\nu-1}u},$$

which holds for all $\nu > 1$ and all $u > 0$. We note that inequalities (14) and (15) in the above forms seem to be new.

Remark 1. We would like to take the opportunity to point out some minor errors, which we found in the papers [5, 8]. In [5] the first author claimed that (13) is equivalent to the Turán type inequality [5, Eq. 3.3]

$$(16) \quad (\nu - 1)K_{\nu-1}(u)K_{\nu+1}(u) - (2\nu - 1)[K_\nu(u)]^2 < 0$$

and conjectured that (16) holds true for all real $\nu \geq 0$. Unfortunately, this claim is not true. We note that (13) is actually equivalent to the Turán type inequality (11). This can be verified by using the recurrence relations (4) and (5) and by using the fact that K_ν is decreasing on $(0, \infty)$ for all $\nu \in \mathbb{R}$. All the same, (16) is valid for all $\nu \in [0, 1]$ and $u > 0$; this follows from (6), as was pointed out in [8]. Moreover, in [8] the first displayed inequality after Theorem 3.1 should be

$$(17) \quad K_\nu^2(u) - K_{\nu-1}(u)K_{\nu+1}(u) < \frac{\nu}{1-\nu}K_\nu^2(u)$$

just like before Theorem 3.1 in [8]. This is an equivalent form of (16), and in view of the fact that the constant zero is the best possible in (6) we conclude that for $\nu > 1$ the inequality (17) or (16) does not hold. Moreover, the claim in [8] that (11) improves (16), when $\nu > 1$, is not true. In view of (17), there is no connection between (11) and (16).

We note that using the symmetry relation $K_\nu(u) = K_{-\nu}(u)$, the inequality (16) can be rewritten as

$$(18) \quad (\nu + 1)K_{\nu-1}(u)K_{\nu+1}(u) - (2\nu + 1)[K_\nu(u)]^2 > 0.$$

In [5] we conjectured that (18) holds true for all $\nu \leq 0$ and $u > 0$. It is important to point out here that in view of the above discussion on (16) the inequality (18) holds true for $\nu \in [-1, 0]$, but does not hold for $\nu \leq -1$.

Finally, we note that in the proof of Theorem 3.1 in [8] the explicit formulas for the function $\phi_\nu : (0, \infty) \rightarrow \mathbb{R}$, defined by

$$\phi_\nu(u) = 1 - \frac{K_{\nu-1}(u)K_{\nu+1}(u)}{K_\nu^2(u)}$$

and its derivative, should be written as

$$\begin{aligned}\phi_\nu(u) &= -\frac{1}{u} \left[\frac{4}{\pi^2} \int_0^\infty \frac{u\gamma(t)dt}{u^2+t^2} + \frac{4}{\pi^2} \int_0^\infty \frac{u(t^2-u^2)\gamma(t)dt}{(u^2+t^2)^2} \right] \\ &= -\frac{4}{\pi^2} \int_0^\infty \frac{2t^2\gamma(t)dt}{(u^2+t^2)^2},\end{aligned}$$

and consequently

$$\phi'_\nu(u) = \frac{32}{\pi^2} \int_0^\infty \frac{ut^2\gamma(t)dt}{(u^2+t^2)^3}.$$

Fortunately, this mistake does not affect the proof of Theorem 3.1 in [8]. The proof of Turán type inequalities (6) and (11) is correct with the above small modifications.

2. TURÁN TYPE INEQUALITIES FOR MODIFIED BESSEL FUNCTIONS

In this section we are going to present some new Turán type inequalities for modified Bessel functions of the first and second kind. As we can see below these inequalities are consequences of some more general results on these functions. Before we state and prove the first main result of this paper let us recall some basics. By definition, a function f is said to be completely monotonic (c.m.) on an interval Δ if f has derivatives of all orders on Δ which alternate successively in sign; that is,

$$(-1)^n f^{(n)}(u) \geq 0$$

for all $u \in \Delta$ and for all $n \geq 0$. It is known that c.m. functions play an eminent role in areas such as probability theory, numerical analysis, physics, and theory of special functions. An interesting exposition of the main results on c.m. functions is given in Widder's book [36] (see also [29]).

The following results complement the discussion given in Section 1.

Theorem 1. *Let I_ν and K_ν be the modified Bessel functions of the first and second kind. Then the following assertions are true:*

- (1) *the function $\nu \mapsto I_{\sqrt{\nu}}(u)$ is log-convex on $(0, \infty)$ for all $u > 0$ fixed;*
- (2) *the function $\nu \mapsto K_{\sqrt{\nu}}(u)$ is log-concave on $(0, \infty)$ for all $u > 0$ fixed;*
- (3) *the function $\nu \mapsto K_{\sqrt{\nu}}(u)/K_{\sqrt{\nu+1}}(u)$ is decreasing on $(0, \infty)$ for all $u > 0$ fixed;*
- (4) *the function $\nu \mapsto I_{\sqrt{\nu}}(u)K_{\sqrt{\nu}}(u)$ is log-convex on $(0, \infty)$ for all $u > 0$ fixed;*
- (5) *the function $\nu \mapsto I_{\sqrt{\nu}}(u)/K_{\sqrt{\nu}}(u)$ is log-convex on $(0, \infty)$ for all $u > 0$ fixed;*
- (6) *the function $\nu \mapsto I_\nu(u)/K_\nu(u)$ is log-concave on $(-1, \infty)$ for all $u > 0$ fixed.*

In particular, for all $\nu > 0$ and $u > 0$, the following Turán type inequalities hold:

$$\begin{aligned}I_{\sqrt{\nu+1}}^2(u) &\leq I_{\sqrt{\nu}}(u)I_{\sqrt{\nu+2}}(u), \\ K_{\sqrt{\nu+1}}^2(u) &\geq K_{\sqrt{\nu}}(u)K_{\sqrt{\nu+2}}(u), \\ K_{\sqrt{\nu+1}}(u)K_{\sqrt{\nu+1}}(u) &\leq K_{\sqrt{\nu}}(u)K_{\sqrt{\nu+1+1}}(u), \\ I_{\sqrt{\nu+1}}^2(u)K_{\sqrt{\nu+1}}^2(u) &\leq I_{\sqrt{\nu}}(u)K_{\sqrt{\nu}}(u)I_{\sqrt{\nu+2}}(u)K_{\sqrt{\nu+2}}(u), \\ I_{\sqrt{\nu+1}}^2(u)/K_{\sqrt{\nu+1}}^2(u) &\leq [I_{\sqrt{\nu}}(u)/K_{\sqrt{\nu}}(u)] [I_{\sqrt{\nu+2}}(u)/K_{\sqrt{\nu+2}}(u)],\end{aligned}$$

and

$$I_{\nu+1}^2(u)/K_{\nu+1}^2(u) \leq [I_\nu(u)/K_\nu(u)] [I_{\nu+2}(u)/K_{\nu+2}(u)].$$

Proof. For the proof of (1) – (4) we use the following results for modified Bessel functions:

- (a) the function $\nu^2 \mapsto I_\nu(u)$ is c.m. on $[0, \infty)$ for each $u > 0$ fixed;
- (b) the function $\nu^2 \mapsto 1/K_\nu(u)$ is c.m. on $[0, \infty)$ for each $u > 0$ fixed;
- (c) the function $\nu \mapsto K_{\sqrt{\nu}+\alpha}(u)/K_{\sqrt{\nu}+\alpha+n}(u)$ is c.m. on $[0, \infty)$ for all $u > 0$, $\alpha \geq 0$ and $n \in \{1, 2, 3, \dots\}$ fixed;
- (d) the function $\nu^2 \mapsto I_\nu(u)K_\nu(v)$ is c.m. on $(0, \infty)$ for each $v \geq u > 0$ fixed.

Parts (a) and (d) were proved by Hartman and Watson [16], part (b) is due to Hartman [14] and part (c) was obtained by Ismail [21]. Now, recall that if the function f is c.m. and the function g is nonnegative with a c.m. derivative, then the composite function $f \circ g$ is also c.m. (see [9, 36]). Thus, since $\nu \mapsto [\sqrt{\nu}]'$ is c.m. on $(0, \infty)$, from parts (a) – (d) we obtain the following results:

- (i) the function $\nu \mapsto I_{\sqrt{\nu}}(u)$ is c.m. on $(0, \infty)$ for each $u > 0$ fixed;
- (ii) the function $\nu \mapsto 1/K_{\sqrt{\nu}}(u)$ is c.m. on $(0, \infty)$ for each $u > 0$ fixed;
- (iii) the function $\nu \mapsto K_{\sqrt{\nu}}(u)/K_{\sqrt{\nu}+1}(u)$ is c.m. on $(0, \infty)$ for all $u > 0$ fixed;
- (iv) the function $\nu \mapsto I_{\sqrt{\nu}}(u)K_{\sqrt{\nu}}(u)$ is c.m. on $(0, \infty)$ for each $u > 0$ fixed.

On the other hand, each nonnegative c.m. function is log-convex (see [36]), and thus parts (i), (ii) and (iv) imply parts (1), (2) and (4) of this theorem, while part (3) follows from (iii).

We note that actually part (3) can be proved directly by using the formula (see [22])

$$\frac{K_{\nu-1}(\sqrt{u})}{\sqrt{u}K_\nu(\sqrt{u})} = \frac{4}{\pi^2} \int_0^\infty \frac{\gamma_\nu(t)dt}{u+t^2}, \quad \text{where } \gamma_\nu(t) = \frac{t^{-1}}{J_\nu^2(t) + Y_\nu^2(t)}$$

and $u, \nu > 0$. Here J_ν and Y_ν stand for the Bessel functions of the first and second kind, respectively. More precisely, in view of the Nicholson formula [35]

$$J_\nu^2(u) + Y_\nu^2(u) = \frac{8}{\pi^2} \int_0^\infty K_0(2u \sinh t) \cosh(2\nu t) dt,$$

the function $\nu \mapsto \gamma_\nu(t)$ is decreasing on $(0, \infty)$ and so is the function $\nu \mapsto \gamma_{\sqrt{\nu}+1}(t)$ for all $t > 0$ fixed. This in turn implies that the function

$$\nu \mapsto \frac{K_{\sqrt{\nu}}(u)}{K_{\sqrt{\nu}+1}(u)} = \frac{4u}{\pi^2} \int_0^\infty \frac{\gamma_{\sqrt{\nu}+1}(t)dt}{u^2+t^2}$$

is decreasing on $(0, \infty)$ for all $u > 0$ fixed.

Finally, we note that part (3) can also be obtained directly by using the fact that the function $\nu \mapsto K_{\nu+a}(u)/K_\nu(u)$ is increasing on $\mathbb{R}$ for each fixed $u > 0$ and $a > 0$ (see [23]).

(5) This follows easily from parts (1) and (2) of this theorem.

(6) Similarly, this follows from the facts (see [7]) that $\nu \mapsto I_\nu(u)$ is log-concave on $(-1, \infty)$ and $\nu \mapsto K_\nu(u)$ is log-convex on $\mathbb{R}$ for all $u > 0$ fixed. $\square$

3. MONOTONICITY PROPERTIES OF THE PRODUCT OF MODIFIED BESSEL FUNCTIONS

Our second main result reads as follows.

Theorem 2. *The function $\nu \mapsto I_\nu(u)K_\nu(u)$ is decreasing on $(0, \infty)$ for all $u > 0$ fixed. Moreover, for all $\nu \geq 1/2$ and $u > 0$ we have*

$$(19) \quad 2I_\nu(u)K_\nu(u) \leq I_{\nu-1}(u)K_{\nu-1}(u) + I_{\nu+1}(u)K_{\nu+1}(u).$$

In particular, the sequence $\{I_n(u)K_n(u)\}_{n \geq 1}$ is decreasing and convex and for all $u > 0$ we have

$$(20) \quad I_0(u)K_0(u) > I_1(u)K_1(u) > I_2(u)K_2(u) > \cdots > I_n(u)K_n(u) > \cdots.$$

Proof. Recall that the function $\nu^2 \mapsto I_\nu(u)K_\nu(u)$ is c.m. on $(0, \infty)$ for each $u > 0$ fixed (see [16]), and consequently the function $\nu \mapsto I_{\sqrt{\nu}}(u)K_{\sqrt{\nu}}(u)$ is also c.m. on $(0, \infty)$ for each $u > 0$ fixed (see part (iv) in the proof of Theorem 1). In particular, the function $\nu \mapsto I_{\sqrt{\nu}}(u)K_{\sqrt{\nu}}(u)$ is decreasing on $(0, \infty)$ for each $u > 0$ fixed, and hence the function $\nu \mapsto I_\nu(u)K_\nu(u)$ is also decreasing on $(0, \infty)$ for all $u > 0$ fixed. Thus, for all $u > 0$ we have

$$I_1(u)K_1(u) > I_2(u)K_2(u) > \cdots > I_n(u)K_n(u) > \cdots.$$

Now, we are going to prove (19). By using the notation $P_\nu(u) = I_\nu(u)K_\nu(u)$, the inequality (19) can be rewritten as

$$(21) \quad 2P_\nu(u) \leq P_{\nu-1}(u) + P_{\nu+1}(u).$$

We note that for the function P_ν the following recurrence formulas (see [31]) are valid:

$$(22) \quad 2\nu P'_\nu(u) = u(P_{\nu+1}(u) - P_{\nu-1}(u))$$

and

$$(23) \quad 2\nu P''_\nu(u) = 4\nu P_\nu(u) - (2\nu - 1)P_{\nu-1}(u) - (2\nu + 1)P_{\nu+1}(u).$$

On the other hand, owing to Hartman [15], we know that the function $u \mapsto uP_\nu(u)$ is concave on $(0, \infty)$ for all $\nu > 1/2$. Since $u \mapsto 2uI_{1/2}(u)K_{1/2}(u) = 1 - e^{-2u}$ is concave on $(0, \infty)$, we conclude that in fact the function $u \mapsto uP_\nu(u)$ is concave on $(0, \infty)$ for all $\nu \geq 1/2$. Consequently, for all $u > 0$ and $\nu \geq 1/2$ we have

$$uP''_\nu(u) \leq -2P'_\nu(u).$$

Now, combining this with (22) and (23) we obtain for all $u > 0$ and $\nu \geq 1/2$,

$$2\nu [2P_\nu(u) - (P_{\nu-1}(u) + P_{\nu+1}(u))] \leq 0,$$

which is equivalent to (21). Finally, by using (19) for $\nu = 1$ we obtain

$$P_1(u) - P_0(u) \leq P_2(u) - P_1(u),$$

and hence by using the fact that the sequence $\{I_n(u)K_n(u)\}_{n \geq 1}$ is decreasing for each $u > 0$, it follows that the sequence $\{I_n(u)K_n(u)\}_{n \geq 0}$ is also decreasing for each $u > 0$; i.e. (20) is valid. With this the proof is complete. $\square$

COMMENTS AND CONCLUDING REMARKS

1. In [12, 18, 19] (see also [17]), the authors study the existence, stability and interaction of localized structures in a one-dimensional generalized FitzHugh-Nagumo type model. Recently, van Heijster and Sandstede [20] started to analyze the existence and stability of radially symmetric solutions in the planar variant of this model. The product of modified Bessel functions $I_\nu(u)K_\nu(u)$ discussed in this note arises naturally in their stability analysis, and the monotonicity condition (20) is important to conclude (in)stability of these radially symmetric solutions.

After we finished the first draft of this paper, van Heijster informed us that the monotonicity of $\nu \mapsto I_\nu(u)K_\nu(u)$ is in fact an immediate consequence of the integral formula [28, p. 98]

$$I_\nu(u)K_\nu(u) = \int_0^\infty I_{2\nu}(2u \sinh t) e^{-2u \cosh t} dt$$

and the monotonicity of $\nu \mapsto I_\nu(u)$. More precisely, due to Cochran [11] we know that $\nu \mapsto I_\nu(u)$ is strictly decreasing on $[0, \infty)$ for all $u > 0$ fixed. By using this result and the above integral formula we conclude that in fact $\nu \mapsto I_\nu(u)K_\nu(u)$ is strictly decreasing on $[0, \infty)$ for all $u > 0$ fixed. Thanks are due to van Heijster for the above information.

2. Let us recall that the function $u \mapsto P_\nu(u) = I_\nu(u)K_\nu(u)$ is strictly decreasing on $(0, \infty)$ for all $\nu > -1$. For $\nu = n \geq 1$, a positive integer, this was proved in 1950 by Phillips and Malin [32], for $\nu \geq 0$ real in 2007 by Penfold et al. [31], and for $\nu \geq -1/2$ and $\nu > -1$ recently by the first author [5, 8]. We note that by using (22) and the monotonicity of $\nu \mapsto P_\nu(u)$, proved in Theorem 2, we obtain immediately that $u \mapsto P_\nu(u)$ is strictly decreasing on $(0, \infty)$ for all $\nu > 1$.

Now, let us consider the function $u \mapsto 2uP_\nu(u)$. Hartman and Watson [16] proved that this function is a continuous cumulative distribution function on $(0, \infty)$ for all $\nu \geq 1/2$. This function actually maps $(0, \infty)$ into $(0, 1)$. Moreover, later Hartman [15] proved that $u \mapsto 2uP_\nu(u)$ is concave on $(0, \infty)$ for all $\nu > 1/2$, and as we pointed out in the proof of Theorem 2, this result is valid also for $\nu = 1/2$. We would like to point out here that actually the monotonicity of $u \mapsto P_\nu(u)$ for $\nu \geq 1/2$ is almost trivial by using the aforementioned concavity result of Hartman. To see this let us recall a particular form of the Pinelis version of the monotone form of l'Hospital's rule (see [33]):

Let $f, g : (a, b) \subset \mathbb{R} \rightarrow \mathbb{R}$ be differentiable functions on (a, b) with $g'(u) \neq 0$ for all $u \in (a, b)$. Furthermore, suppose that $\lim_{u \rightarrow a} f(u) = \lim_{u \rightarrow a} g(u) = 0$ and f'/g' is decreasing on (a, b) . Then the ratio f/g is decreasing too on (a, b) .

Appealing to this result, since $\lim_{u \rightarrow 0} 2uP_\nu(u) = \lim_{u \rightarrow 0} u/\nu = 0$, for $\nu \geq 1/2$, to prove the monotonicity of $u \mapsto P_\nu(u) = uP_\nu(u)/u$ it is enough to show that $u \mapsto [uP_\nu(u)]'/u'$ is decreasing, which is clearly true because $u \mapsto uP_\nu(u)$ is concave.

3. Finally, we note that the product P_ν is useful also in other problems of applied mathematics. For example, in 1986 Cantrell [10] derived tight upper bounds for the function $u \mapsto uI_{n+1}(u)K_{m+1}(u)$, in order to obtain suitable truncation and transient errors in the computation of the generalized Marcum Q -function.

Motivated by Theorems 1 and 2 we pose the following problem.

Open problem. Is it true that $\nu \mapsto I_\nu(u)K_\nu(u)$ is log-convex on $(-1, \infty)$ for all $u > 0$ fixed?

ACKNOWLEDGMENTS

The research of the first author was supported by the János Bolyai Research Scholarship of the Hungarian Academy of Sciences, by the Romanian National Council for Scientific Research in Education CNCSIS-UEFISCSU, project number PN-II-RU-PD_388/2011 and was completed during this author's visit to the Indian Institute of Technology Madras, Chennai, India. The visit was supported by a

partial travel grant from the Commission on Development and Exchanges, International Mathematical Union. The authors are indebted to Peter van Heijster for his useful comments and suggestions, which enhanced this paper.
