ON MAPS OF A SPHERE TO A SIMPLY CONNECTED SPACE WITH FINITELY GENERATED HOMOTOPY GROUPS

S. S. PODKORYTOV

ABSTRACT. It is proved that the homotopy class of a map of a sphere to a simply connected CW-complex with finitely generated homotopy groups depends polynomially on the induced homomorphism of the groups of zero-dimensional singular chains.

INTRODUCTION. MAIN RESULT

Terminology and notation. We denote $\mathbb{N} = \{1, 2, \dots\}$ and $\mathbb{N}_0 = \mathbb{N} \cup \{0\}$; $\mathcal{P}$ is the set of all primes.

A *pointed set* is a set with a distinguished element; the latter is denoted by $*$. Any Abelian group is a pointed set with $*$ = 0. Any pointed space is a pointed set. For a pointed set T , let $\langle T \rangle$ denote the (free) Abelian group with generators ‘ t ’, $t \in T$, and a single relation ‘ $*$ ’ = 0.

A map $f: T \rightarrow T'$ of pointed sets is said to be *bound* if $f(*) = *$. In this case we introduce the homomorphism

$$\langle f \rangle: \langle T \rangle \rightarrow \langle T' \rangle, \quad \langle f \rangle('t') = 'f(t)', \quad t \in T.$$

For $q \in \mathbb{N}_0$ and a pointed space X , let $\Pi_q X$ be the pointed set of all continuous bound maps $a: S^q \rightarrow X$ ($*(S^q) = \{*\}$).

For a map $a \in \Pi_q X$, $[a] \in \pi_q X$ is its homotopy class. We put

$$\Psi_q X := \text{Hom}(\langle S^q \rangle, \langle X \rangle).$$

By an *equivalence* we mean a weak homotopy equivalence. A space X is *admissible* if there exists a CW-complex Y and an equivalence $h: X \rightarrow Y$.

1. Theorem. Suppose $m \in \mathbb{N}$ and X is a simply connected admissible pointed space with finitely generated homotopy groups. For $r \in \mathbb{N}_0$, let $Q_r \subset (\Psi_m X)^{\otimes r}$ be the subgroup generated by the elements $\langle a \rangle^{\otimes r}$, $a \in \Pi_m X$. Then for any sufficiently large $r \in \mathbb{N}_0$ there exists a homomorphism $l: Q_r \rightarrow \pi_m X$ such that $l(\langle a \rangle^{\otimes r}) = [a]$ for each $a \in \Pi_m X$.

Discussion. The condition that the homotopy groups are finitely generated seems to be superfluous. We show that the simple connectivity condition is essential (if $m > 1$). (Perhaps, homotopy simplicity would suffice.) We use the action of the fundamental group of a pointed space on its higher homotopy groups.

Let $p \in \Pi_1 X$, $q \in \Pi_m X$, and let $p_0 = * \in \Pi_1 X$, $p_1 = p$. For $r \in \mathbb{N}_0$, we put

$$B = \left(\bigvee_{s=0}^r S^1 \right) \vee S^m, \quad A_{e_0 \dots e_r} = \left(\bigvee_{s=0}^r p_{e_s} \right) \vee q: B \rightarrow X, \quad e_0, \dots, e_r \in \{0, 1\}.$$

Suppose $j_0, \dots, j_r \in \Pi_1 B$ and $k \in \Pi_m B$ are canonical embeddings. We choose a map $h \in \Pi_m B$ with $[h] = [j_0] \cdots [j_r][k]$ and put

$$a_{e_0 \dots e_r} = A_{e_0 \dots e_r} \circ h \in \Pi_m X, \quad e_0, \dots, e_r \in \{0, 1\}.$$

It is easily seen that there exist homomorphisms

$$V_0, \dots, V_r, W : \langle B \rangle \rightarrow \langle X \rangle$$

such that

$$\langle A_{e_0 \dots e_r} \rangle = e_0 V_0 + \cdots + e_r V_r + W, \quad e_0, \dots, e_r \in \{0, 1\}.$$

Put

$$v_s = V_s \circ \langle h \rangle \in \Psi_m X, \quad s = 0, \dots, r, \quad w = W \circ \langle h \rangle \in \Psi_m X.$$

We have

$$\langle a_{e_0 \dots e_r} \rangle = e_0 v_0 + \cdots + e_r v_r + w, \quad e_0, \dots, e_r \in \{0, 1\}.$$

This implies the relation

$$\sum_{e_0, \dots, e_r \in \{0, 1\}} (-1)^{e_0 + \cdots + e_r} \langle a_{e_0 \dots e_r} \rangle^{\otimes r} = 0.$$

If the required homomorphism exists, then

$$\sum_{e_0, \dots, e_r \in \{0, 1\}} (-1)^{e_0 + \cdots + e_r} [a_{e_0 \dots e_r}] = 0.$$

It is easily seen that

$$[a_{e_0 \dots e_r}] = [p]^{e_0 + \cdots + e_r} [q], \quad e_0, \dots, e_r \in \{0, 1\}.$$

Suppose that p, q are chosen in such a way that $[p][q] = -[q]$ and $[q]$ is of infinite order in $\pi_m X$ (for example, this is possible if m is even and $X = \mathbb{R}P^m$). Then

$$\sum_{e_0, \dots, e_r \in \{0, 1\}} (-1)^{e_0 + \cdots + e_r} [a_{e_0 \dots e_r}] = 2^{r+1} [q] \neq 0. \quad \square$$

Outline of the proof of Theorem 1. The proof consists of two parts, “primary” and “rational”, in conformity with the structure of $\pi_m X$ (see §14). In the primary part, the space X is replaced by a space with primary finite homotopy groups (§9) and the Serre method is used: the homotopy groups below the m th group are killed gradually, and then the Hurewicz theorem is applied to the m th group (§8). In the rational part, we pass from the space X to its loop space, in which the rational homotopy class of a spheroid is determined by its homology class in view of the Cartan–Serre theorem. (More precisely, instead of the loop space we use a certain model of its multiple suspension, a version of the cobar construction; see §§12, 13.) $\square$

§1. PRELIMINARIES

Main maps. Suppose $q \in \mathbb{N}_0$ and X is a pointed space. The maps

$$J_{q,X} : \Pi_q X \rightarrow \Psi_q X, \quad a \mapsto \langle a \rangle, \quad \text{and} \quad P_{q,X} : \Pi_q X \rightarrow \pi_q X, \quad a \mapsto [a],$$

are called the *main* maps. Sometimes, we do not mention q and X and simply write J and P , or J' and P' , etc.

Induced maps. Suppose $q \in \mathbb{N}_0$ and $f : X \rightarrow X'$ is a continuous bound map of pointed spaces. Let

$$\begin{aligned} H_q f : H_q X &\rightarrow H_q X', & \pi_q f : \pi_q X &\rightarrow \pi_q X'; \\ \Pi_q f : \Pi_q X &\rightarrow \Pi_q X', & \Psi_q f : \Psi_q X &\rightarrow \Psi_q X', \end{aligned}$$

be the induced maps. (We put $(\Pi_q f)(a) = f \circ a$, $a \in \Pi_q X$, and $(\Psi_q f)(w) = \langle f \rangle \circ w$, $w \in \Psi_q X$.)

More functors. Suppose $q \in \mathbb{N}_0$, and T is a pointed set. We denote by $\Phi_q T$ the pointed set of all bound maps $A : S^q \rightarrow T$ ($*(S^q) = \{*\}$). If U is an Abelian group, so is $\Phi_q U$.

For a bound map $f : T \rightarrow T'$, we introduce the bound map

$$\Phi_q f : \Phi_q T \rightarrow \Phi_q T', \quad A \mapsto f \circ A.$$

Free Abelian groups. For a set T , let $\langle \underline{T} \rangle$ be the Abelian group with free generators ' $\underline{t}$ ', $t \in T$.

We introduce the homomorphism

$$\langle \underline{T} \rangle \rightarrow \mathbb{Z}, \quad x \mapsto \bar{x}, \quad \bar{t} := 1, \quad t \in T.$$

A map $f : T \rightarrow T'$ induces the homomorphism

$$\langle \underline{f} \rangle : \langle \underline{T} \rangle \rightarrow \langle \underline{T'} \rangle, \quad \langle \underline{f} \rangle(\bar{t}) := \bar{f(t)}, \quad t \in T.$$

Reduction modulo q . Suppose $q \in \mathbb{N}$, U is an Abelian group, and $u \in U$. We put $U/q := U \otimes \mathbb{Z}_q$, $u|_q := u \otimes 1 \in U/q$. For a homomorphism $h : U \rightarrow V$ of Abelian groups, we introduce the homomorphism

$$h/q : U/q \rightarrow V/q, \quad (h/q)(u|_q) = h(u)|_q, \quad u \in U.$$

p -Special Abelian groups. Suppose $p \in \mathcal{P}$. We say that an Abelian group is *p -special* if it is finite and its order is a power of p .

Increasing maps. By an *increasing* map we mean a nonstrictly increasing map.

Simplicial objects and morphisms. For $q \in \mathbb{N}_0$, we put

$$[q] := \{0, \dots, q\}.$$

For $p \in \mathcal{P}$, a *simplicial p -special Abelian group* is a simplicial Abelian group $\mathbf{U}$ such that the groups $\mathbf{U}_q$, $q \in \mathbb{N}_0$, are p -special.

A *simplicial pointed set* and a *simplicial bound map* are a simplicial object and a simplicial morphism (respectively) of the category of pointed sets and bound maps. (Simplicial pointed set = pointed simplicial set; the geometric realization of a simplicial pointed set is a pointed space; the same applies to simplicial bound maps.)

A *simplicial finite set* is a simplicial set $\mathbf{T}$ such that the sets $\mathbf{T}_q$, $q \in \mathbb{N}_0$, are finite. A *simplicial finite pointed set* is understood similarly.

For simplicial pointed sets $\mathbf{T}$ and $\mathbf{T}'$, a simplicial bound map $\mathbf{f} : \mathbf{T} \rightarrow \mathbf{T}'$ is called an *embedding* if the maps $\mathbf{f}_q$, $q \in \mathbb{N}_0$, are injective.

Convenient spaces etc. A *convenient space* is the realization of a simplicial countable set. A *convenient map*, a *convenient pair*, etc. are understood accordingly.

Cubes and simplexes. Suppose $r \in \mathbb{N}_0$. We put $I = [0, 1]$, $I^r = I^{\times r}$. We make obvious identifications: $I^p \times I^q = I^{p+q}$ ($p, q \in \mathbb{N}_0$), $I^1 = I$. Also, we put

$$\Delta^r = \{(z_1, \dots, z_r) \in I^{\times r} : z_1 \leq \dots \leq z_r\}.$$

For $t = (t_1, \dots, t_r) \in I^r$ we put $t^\Delta = (z_1, \dots, z_r) \in \Delta^r$, where $z_s = t_s \dots t_r$, $s = 1, \dots, r$.

Spheres. Suppose $r \in \mathbb{N}_0$. Convention: $S^r = I^r / \partial I^r$. For the projection $I^r \rightarrow S^r$ we write $t \mapsto t^\circ$ ($t \in I^r$).

Suspension. Suppose $r \in \mathbb{N}_0$ and X is a pointed space. We put

$$S^r X = I^r \times X / (\partial I^r \times X \cup I^r \times \{*\}).$$

For the projection $I^r \times X \rightarrow S^r X$ we write $(t, x) \mapsto t^\circ x$ ($t \in I^r$, $x \in X$). Let $q \in \mathbb{N}$. The map

$$Z^r : \Pi_q X \rightarrow \Pi_{q+r} X, \quad Z^r(a)((t, s)^\circ) = t^\circ a(s^\circ), \quad t \in I^r, \quad s \in I^q,$$

is called the *suspension transformation*. We recall that the suspension homomorphism is defined as follows:

$$z^r : \pi_q X \rightarrow \pi_{q+r} X, \quad z^r([a]) = [Z^r(a)], \quad a \in \Pi_q X.$$

Path and loop spaces. For a space X , by ΓX we denote the space of all paths $u : I \rightarrow X$. A continuous map $f : X \rightarrow X'$ induces the map

$$\Gamma f : \Gamma X \rightarrow \Gamma X', \quad (\Gamma f)(u) := f \circ u.$$

For a pointed space X we have $\Omega X \subset \Gamma X$.

Nameless arrows. Suppose X is a pointed space and $q \in \mathbb{N}$. We refer to the bijection

$$D : \Pi_{q+1} X \rightarrow \Pi_q \Omega X, \quad D(a)(s^\circ)(t) := a((t, s)^\circ), \quad s \in I^q, \quad t \in I,$$

and the isomorphism

$$d : \pi_{q+1} X \rightarrow \pi_q \Omega X, \quad [a] \mapsto [D(a)], \quad a \in \Pi_{q+1} X,$$

as to the *nameless bijection* and the *nameless homomorphism*.

Weak continuity. A map $f : X \rightarrow Y$ of spaces is said to be *weakly continuous* if for any compact Hausdorff space T and any continuous map $k : T \rightarrow X$ the map $f \circ k : T \rightarrow Y$ is continuous.

§2. COMPARISON OF MAPS OF A SET TO ABELIAN GROUPS

In this section we introduce polynomial dependence relations between maps of a set to Abelian groups and study the properties of such relations.

Notation. Suppose T is a set, U is an Abelian group, and $e : T \rightarrow U$ is a map. Consider the homomorphism

$$e^+ : \langle \underline{T} \rangle \rightarrow U, \quad e^+(\underline{t}) := e(t), \quad t \in T.$$

For $t \in T$, we put

$$t^e = \{x \in \langle \underline{T} \rangle : \bar{x} = 1, e^+(x) = e(t)\}.$$

For $r \in \mathbb{N}_0$, let

$$[e]_r \subset \langle \underline{T} \rangle^{\otimes r}$$

be the subgroup generated by the elements $x^{\otimes r}$, $x \in t^e$, $t \in T$.

Definition. Suppose $e : T \rightarrow U$ and $f : T \rightarrow V$ are maps to Abelian groups. For $r \in \mathbb{N}_0$, we write

$$e \xrightarrow{r} f$$

if there exists a homomorphism $k : [e]_r \rightarrow V$ such that $k(x^{\otimes r}) = f(t)$ for any $t \in T$ and $x \in t^e$. We write

$$e \twoheadrightarrow f$$

if $e \xrightarrow{r} f$ for some $r \in \mathbb{N}_0$.

2.1. Lemma. Suppose $e : T \rightarrow U$ and $f : T \rightarrow V$ are maps to Abelian groups, $r \in \mathbb{N}_0$, and $e \xrightarrow{r} f$. Then $e \xrightarrow{r+1} f$.

Proof. Since $e \xrightarrow{r} f$, there exists a homomorphism $k: [e]_r \rightarrow V$ such that $k(x^{\otimes r}) = f(t)$ for any $t \in T$ and $x \in t^e$. We introduce the homomorphism

$$L: \langle T \rangle \otimes [e]_r \rightarrow V, \quad L(x \otimes z) := \bar{x}k(z).$$

We have

$$\langle T \rangle \otimes [e]_r \subset \langle T \rangle \otimes \langle T \rangle^{\otimes r} = \langle T \rangle^{\otimes(r+1)}.$$

If $t \in T$ and $x \in t^e$, then $L(x^{\otimes(r+1)}) = \bar{x}k(x^{\otimes r}) = f(t)$, because $\bar{x} = 1$, $k(x^{\otimes r}) = f(t)$. Therefore, $e \xrightarrow{r+1} f$. $\square$

2.2. Lemma. Suppose U and V are Abelian groups, $e: T \rightarrow U$ is a map, and $h: U \rightarrow V$ is a homomorphism. Then a) $e \xrightarrow{1} h \circ e$; b) if h is a monomorphism, then $h \circ e \xrightarrow{1} e$.

Proof. We have $[e]_1 \subset \langle T \rangle^{\otimes 1} = \langle T \rangle$. Let $k: [e]_1 \rightarrow U$ be the restriction of the homomorphism e^+ . For $t \in T$ and $x \in t^e$ we have $k(x^{\otimes 1}) = e^+(x) = e(t)$. (Thus, $e \xrightarrow{1} e$.) The homomorphism $h \circ k: [e]_1 \rightarrow V$ yields $e \xrightarrow{1} h \circ e$. If h is a monomorphism, then $[h \circ e]_1 = [e]_1$ (this is easy to check) and the homomorphism $k: [h \circ e]_1 \rightarrow U$ yields $h \circ e \xrightarrow{1} e$. $\square$

2.3. Lemma. Suppose $e: T \rightarrow U$, $f: T \rightarrow V$, and $g: T \rightarrow W$ are maps to Abelian groups, and $r, s \in \mathbb{N}_0$. Suppose $e \xrightarrow{r} f$ and $f \xrightarrow{s} g$. Then $e \xrightarrow{rs} g$.

Proof. Consider the homomorphism

$$c: \langle T \rangle \rightarrow \mathbb{Z}, \quad c(x) := \bar{x}.$$

We have a homomorphism $c^{\otimes r}: \langle T \rangle^{\otimes r} \rightarrow \mathbb{Z}^{\otimes r} = \mathbb{Z}$. Since $e \xrightarrow{r} f$, there exists a homomorphism $k: [e]_r \rightarrow V$ such that $k(x^{\otimes r}) = f(t)$ for every $t \in T$ and $x \in t^e$. We introduce the homomorphisms

$$h: [e]_r \rightarrow \mathbb{Z} \oplus V, \quad h(z) := (c^{\otimes r}(z), k(z))$$

and

$$F: \langle T \rangle \rightarrow \mathbb{Z} \oplus V, \quad F(x) = (\bar{x}, f^+(x)).$$

For $t \in T$ and $x \in t^e$, we have $h(x^{\otimes r}) = (1, f(t)) = F(\langle t \rangle)$. Therefore, $\text{im } h \subset \text{im } F$. Since the Abelian group $[e]_r$ is free (this is a subgroup of the free Abelian group $\langle T \rangle^{\otimes r}$), there exists a homomorphism $b: [e]_r \rightarrow \langle T \rangle$ such that $F \circ b = h$. For $t \in T$ and $x \in t^e$ we have $b(x^{\otimes r}) \in t^f$, because $F(b(x^{\otimes r})) = h(x^{\otimes r}) = (1, f(t))$.

Note that

$$[e]_r^{\otimes s} \subset (\langle T \rangle^{\otimes r})^{\otimes s} = \langle T \rangle^{\otimes(rs)}.$$

We have a homomorphism

$$b^{\otimes s}: [e]_r^{\otimes s} \rightarrow \langle T \rangle^{\otimes s}.$$

Clearly, $[e]_{rs} \subset [e]_r^{\otimes s}$. We have $b^{\otimes s}([e]_{rs}) \subset [f]_s$; indeed, if $t \in T$ and $x \in t^e$, then $b^{\otimes s}(x^{\otimes rs}) = b(x^{\otimes r})^{\otimes s} \in [f]_s$ because $b(x^{\otimes r}) \in t^f$. Since $f \xrightarrow{s} g$, there exists a homomorphism $l: [f]_s \rightarrow W$ such that $l(y^{\otimes s}) = g(t)$ for any $t \in T$ and $y \in t^f$. Consider the homomorphism

$$m: [e]_{rs} \rightarrow W, \quad m(Z) = l(b^{\otimes s}(Z)).$$

For $t \in T$ and $x \in t^e$ we have

$$m(x^{\otimes rs}) = l(b^{\otimes s}(x^{\otimes rs})) = l(b(x^{\otimes r})^{\otimes s}) = g(t)$$

because $b(x^{\otimes r}) \in t^f$. Thus, $e \xrightarrow{rs} f$. $\square$

2.4. Lemma. Suppose $g: Z \rightarrow T$ is a map, $e: T \rightarrow U$ and $f: T \rightarrow V$ are maps to Abelian groups, and $r \in \mathbb{N}_0$. If $e \xrightarrow{r} f$, then $e \circ g \xrightarrow{r} f \circ g$.

Proof. Note that $\langle g \rangle(y) \in g(z)^e$ for $z \in Z$ and $y \in z^{e \circ g}$. We have a homomorphism

$$\langle g \rangle^{\otimes r} : \langle Z \rangle^{\otimes r} \rightarrow \langle T \rangle^{\otimes r}.$$

Next, $\langle g \rangle^{\otimes r}(\llbracket e \circ g \rrbracket_r) \subset \llbracket e \rrbracket_r$; indeed, for $z \in Z$ and $y \in z^{e \circ g}$ we have $\langle g \rangle^{\otimes r}(y^{\otimes r}) = \langle g \rangle(y)^{\otimes r} \in \llbracket e \rrbracket_r$ because $\langle g \rangle(y) \in g(z)^e$. Since $e \xrightarrow{r} f$, there is a homomorphism $k : \llbracket e \rrbracket_r \rightarrow V$ such that $k(x^{\otimes r}) = f(t)$ for each $t \in T$ and $x \in t^e$. Consider the homomorphism

$$l : \llbracket e \circ g \rrbracket_r \rightarrow V, \quad w \mapsto k(\langle g \rangle^{\otimes r}(w)).$$

For $z \in Z$ and $y \in z^{e \circ g}$ we can write

$$l(y^{\otimes r}) = k(\langle g \rangle^{\otimes r}(y^{\otimes r})) = k(\langle g \rangle(y)^{\otimes r}) = f(g(z))$$

because $\langle g \rangle(y) \in g(z)^e$. Thus, $e \circ g \xrightarrow{r} f \circ g$. $\square$

2.5. Lemma. Suppose $e : T \rightarrow U$ and $f : T \rightarrow V$ are maps to Abelian groups and $r \in \mathbb{N}_0$. If $e|_D \xrightarrow{r} f|_D$ for each finite set $D \subset T$, then $e \xrightarrow{r} f$.

Proof. We must show that there exists a homomorphism $k : \llbracket e \rrbracket_r \rightarrow V$ such that $k(x^{\otimes r}) = f(t)$ for each $t \in T$ and $x \in t^e$. Take an arbitrary number $n \in \mathbb{N}_0$ and elements $t_i \in T$, $x_i \in t_i^e$, $i = 1, \dots, n$. Let $P \subset \langle T \rangle^{\otimes r}$ be the subgroup generated by the elements $x_i^{\otimes r}$, $i = 1, \dots, n$. It suffices to show that there exists a homomorphism $k' : P \rightarrow V$ such that $k'(x_i^{\otimes r}) = f(t_i)$, $i = 1, \dots, n$. There is a finite set $D \subset T$ such that $t_i \in D$ and $x_i \in \langle D \rangle$ ($\subset \langle T \rangle$) for each $i = 1, \dots, n$. We have $P \subset \langle D \rangle^{\otimes r} \subset \langle T \rangle^{\otimes r}$. Since $e|_D \xrightarrow{r} f|_D$, the desired homomorphism k' exists. $\square$

2.6. Lemma. Suppose $e : T \rightarrow U$ and $f_j : T \rightarrow V_j$, $j \in J$, are maps to Abelian groups and $r \in \mathbb{N}_0$. Put

$$f = \prod_{j \in J} f_j : T \rightarrow \prod_{j \in J} V_j.$$

If $e \xrightarrow{r} f_j$, $j \in J$, then $e \xrightarrow{r} f$.

2.7. Lemma. Suppose $e_j : T_j \rightarrow U_j$ and $f_j : T_j \rightarrow V_j$, $j \in J$, are maps to Abelian groups and $r \in \mathbb{N}_0$. Put

$$E = (e_j)_{j \in J} : \prod_{j \in J} T_j \rightarrow \prod_{j \in J} U_j, \quad F = (f_j)_{j \in J} : \prod_{j \in J} T_j \rightarrow \prod_{j \in J} V_j.$$

If $e_j \xrightarrow{r} f_j$, $j \in J$, then $E \xrightarrow{r} F$.

Proof. We take an arbitrary $i \in J$ and consider the commutative diagram

$$\begin{array}{ccccc} \prod_{j \in J} U_j & \xleftarrow{E} & \prod_{j \in J} T_j & \xrightarrow{F} & \prod_{j \in J} V_j \\ p' \downarrow & & p \downarrow & & p'' \downarrow \\ U_i & \xleftarrow{e_i} & T_i & \xrightarrow{f_i} & V_i, \end{array}$$

where p , p' , and p'' are projections. By Lemma 2.6, it suffices to show that $E \xrightarrow{r} p'' \circ F$. By assertion a) of Lemma 2.2, $E \xrightarrow{1} p' \circ E = e_i \circ p$. Since $e_i \xrightarrow{r} f_i$, Lemma 2.4 implies the relation $e_i \circ p \xrightarrow{r} f_i \circ p = p'' \circ F$. Therefore, $E \xrightarrow{r} p'' \circ F$ by Lemma 2.3. $\square$

2.8. Lemma. Suppose U is an Abelian group and $r \in \mathbb{N}_0$. If

$$R : U \rightarrow U^{\otimes r}, \quad u \mapsto u^{\otimes r},$$

then $\text{id} = \text{id}_U \xrightarrow{r} R$.

Proof. Consider the homomorphism $(\text{id}^+)^{\otimes r}: \langle \underline{U} \rangle^{\otimes r} \rightarrow U^{\otimes r}$. For $u \in U$ and $x \in u^{\text{id}} \subset \langle \underline{U} \rangle$, we have

$$(\text{id}^+)^{\otimes r}(x^{\otimes r}) = \text{id}^+(x)^{\otimes r} = u^{\otimes r} = R(u).$$

Thus, $\text{id} \xrightarrow{r} R$. $\square$

2.9. Claim. Suppose $e: T \rightarrow U$ and $f: T \rightarrow V$ are maps to Abelian groups, and $r \in \mathbb{N}_0$. Suppose $\text{Tors } U = 0$ and $e \xrightarrow{r} f$. Let $Q \subset (\mathbb{Z} \oplus U)^{\otimes r}$ be the subgroup generated by the elements $(1, e(t))^{\otimes r}$, $t \in T$. Then there exists a homomorphism $l: Q \rightarrow V$ such that $l((1, e(t))^{\otimes r}) = f(t)$ for each $t \in T$.

Proof. Consider the homomorphism

$$E: \langle \underline{T} \rangle \rightarrow \mathbb{Z} \oplus U, \quad \underline{t} \mapsto (1, e(t)), \quad t \in T.$$

We have a homomorphism

$$E^{\otimes r}: \langle \underline{T} \rangle^{\otimes r} \rightarrow (\mathbb{Z} \oplus U)^{\otimes r}.$$

Not that $E^{\otimes r}(\llbracket e \rrbracket_r) = Q$, because for $t \in T$ and $x \in t^e$ (in particular, for $x = \underline{t}$) we have

$$E^{\otimes r}(x^{\otimes r}) = E(x)^{\otimes r} = E(\underline{t})^{\otimes r} = (1, e(t))^{\otimes r}.$$

Since $e \xrightarrow{r} f$, there exists a homomorphism $k: \llbracket e \rrbracket_r \rightarrow V$ such that $k(x^{\otimes r}) = f(t)$ for each $t \in T$ and $x \in t^e$. It suffices to show that there exists a homomorphism $l: Q \rightarrow V$ such that $l(E^{\otimes r}(z)) = k(z)$ for each $z \in \llbracket e \rrbracket_r$. Indeed, in this case for $t \in T$ we have

$$l((1, e(t))^{\otimes r}) = l(E(\underline{t})^{\otimes r}) = l(E^{\otimes r}(\underline{t}^{\otimes r})) = k(\underline{t}^{\otimes r}) = f(t),$$

as required.

It suffices to show that $\llbracket e \rrbracket_r \cap \ker E^{\otimes r} \subset \ker k$. We take an arbitrary $z \in \llbracket e \rrbracket_r \cap \ker E^{\otimes r}$ and show that $z \in \ker k$. Since $z \in \llbracket e \rrbracket_r$, there exist numbers $n \in \mathbb{N}_0$, $a_i \in \mathbb{Z}$ and elements $t_i \in T$, $x_i \in t_i^e$, $i = 1, \dots, n$, such that

$$z = \sum_{i=1}^n a_i x_i^{\otimes r}.$$

Let $B \subset \mathbb{Z} \oplus U$ be the subgroup generated by the elements $E(\underline{t}_i)$, $i = 1, \dots, n$. It is free because $\text{Tors } U = 0$. Consequently, there exists a homomorphism

$$d: B \rightarrow \langle \underline{T} \rangle$$

such that $E(d(b)) = b$ for any $b \in B$. Put $y_i = d(E(\underline{t}_i))$, $i = 1, \dots, n$. Then $y_i \in t_i^e$, $i = 1, \dots, n$. Note that $B^{\otimes r} \subset (\mathbb{Z} \oplus U)^{\otimes r}$. We have a homomorphism $d^{\otimes r}: B^{\otimes r} \rightarrow \langle \underline{T} \rangle^{\otimes r}$. Since

$$y_i = d(E(\underline{t}_i)) = d(E(x_i)), \quad i = 1, \dots, n,$$

it follows that

$$y_i^{\otimes r} = d(E(x_i))^{\otimes r} = d^{\otimes r}(E^{\otimes r}(x_i^{\otimes r})), \quad i = 1, \dots, n.$$

Thus,

$$\sum_{i=1}^n a_i y_i^{\otimes r} = \sum_{i=1}^n a_i d^{\otimes r}(E^{\otimes r}(x_i^{\otimes r})) = d^{\otimes r}(E^{\otimes r}(z)) = 0$$

because $z \in \ker E^{\otimes r}$. Since

$$k(x_i^{\otimes r}) = f(t) = k(y_i^{\otimes r}), \quad i = 1, \dots, n,$$

we see that

$$k(z) = \sum_{i=1}^n a_i k(x_i^{\otimes r}) = \sum_{i=1}^n a_i k(y_i^{\otimes r}) = 0. \quad \square$$

2.10. Lemma. Suppose $e : T \rightarrow U$ and $f : T \rightarrow V$ are maps to Abelian groups and $r \in \mathbb{N}_0$. Suppose $\text{Tors } U = 0$ and $e \xrightarrow{r} f$. Let

$$P \subset \bigoplus_{s=0}^r U^{\otimes s}$$

be the subgroup generated by the elements $(e(t)^{\otimes s})_{s=0}^r$, $t \in T$. Then there exists a homomorphism $k : P \rightarrow V$ such that $k((e(t)^{\otimes s})_{s=0}^r) = f(t)$ for any $t \in T$.

Proof. Let $Q \subset (\mathbb{Z} \oplus U)^{\otimes r}$ be the subgroup generated by the elements $(1, e(t))^{\otimes r}$, $t \in T$. Since $\text{Tors } U = 0$ and $e \xrightarrow{r} f$, Claim 2.9 yield the existence of a homomorphism $l : Q \rightarrow V$ such that $l((1, e(t))^{\otimes r}) = f(t)$ for any $t \in T$.

Let $i = (1, 0) \in \mathbb{Z} \oplus U$, and let $j : U \rightarrow \mathbb{Z} \oplus U$ be the canonical embedding. For each $s = 0, \dots, r$ we introduce the homomorphism

$$g_s : U^{\otimes s} \rightarrow (\mathbb{Z} \oplus U)^{\otimes r},$$

$$g_s(u_1 \otimes \dots \otimes u_s) := \sum_{\substack{t_0, \dots, t_s \in \mathbb{N}_0: \\ t_0 + \dots + t_s = r-s}} i^{\otimes t_0} \otimes j(u_1) \otimes i^{\otimes t_1} \otimes \dots \otimes j(u_s) \otimes i^{\otimes t_s}.$$

Put

$$G = \bigoplus_{s=0}^r g_s : \bigoplus_{s=0}^r U^{\otimes s} \rightarrow (\mathbb{Z} \oplus U)^{\otimes r}.$$

It is easily seen that $G((u^{\otimes s})_{s=0}^r) = (1, u)^{\otimes r}$ for $u \in U$. In particular, $G((e(t)^{\otimes s})_{s=0}^r) = (1, e(t))^{\otimes r}$ for any $t \in T$. Thus, $G(P) = Q$. If $k(z) = l(G(z))$, $z \in P$, then for $t \in T$ we have

$$k((e(t)^{\otimes s})_{s=0}^r) = l(G((e(t)^{\otimes s})_{s=0}^r)) = l((1, e(t))^{\otimes r}) = f(t). \quad \square$$

2.11. Corollary. Suppose T is a pointed set, $e : T \rightarrow U$ and $f : T \rightarrow V$ are bound maps to Abelian groups, and $r \in \mathbb{N}_0$. Suppose $\text{Tors } U = 0$ and $e \xrightarrow{r} f$. Let

$$P \subset \bigoplus_{s=1}^r U^{\otimes s}$$

be the subgroup generated by the elements $(e(t)^{\otimes s})_{s=1}^r$, $t \in T$. Then there exists a homomorphism $k : P \rightarrow V$ such that $k((e(t)^{\otimes s})_{s=1}^r) = f(t)$ for any $t \in T$.

Proof. Let

$$P' \subset \bigoplus_{s=0}^r U^{\otimes s}$$

be the subgroup generated by the elements $(e(t)^{\otimes s})_{s=0}^r$, $t \in T$. Since $\text{Tors } U = 0$ and $e \xrightarrow{r} f$, by Lemma 2.10 there exists a homomorphism $k' : P' \rightarrow V$ such that $k'((e(t)^{\otimes s})_{s=0}^r) = f(t)$ for any $t \in T$. Let

$$q : \bigoplus_{s=0}^r U^{\otimes s} \rightarrow \bigoplus_{s=1}^r U^{\otimes s}$$

be the projection. Clearly, $q(P') = P$. Put

$$i = (1, 0, \dots, 0) \in \bigoplus_{s=0}^r U^{\otimes s}.$$

Then $i = (0^{\otimes s})_{s=0}^r = (e(*)^{\otimes s})_{s=0}^r$. Therefore, $k'(i) = f(*) = 0$. Since i generates $\ker q$, there exists a homomorphism $k : P \rightarrow V$ such that $k(q(z)) = k'(z)$ for any $z \in P'$. For $t \in T$ we have

$$k((e(t)^{\otimes s})_{s=1}^r) = k(q((e(t)^{\otimes s})_{s=0}^r)) = k'((e(t)^{\otimes s})_{s=0}^r) = f(t). \quad \square$$

§3. COMPARISON OF MAPS TO p -SPECIAL ABELIAN GROUPS

Our aim in this section is to prove Lemma 3.5.

Notation. Suppose $q \in \mathbb{Z}$, U is an Abelian group, and $u \in U$. Put

$$\mathbf{1}_{qU}(u) = \begin{cases} 1 & \text{if } u \in qU, \\ 0 & \text{otherwise.} \end{cases}$$

For $q, z \in \mathbb{Z}$ we denote $\mathbf{1}_{(q)}(z) = \mathbf{1}_{q\mathbb{Z}}(z)$.

3.1. Lemma. Suppose $p \in \mathcal{P}$, $m \in \mathbb{N}$, and $z \in \mathbb{Z}$. Then

$$\binom{z-1}{p^m-1} \equiv \mathbf{1}_{(p^m)}(z) \pmod{p}.$$

Proof. If $z \not\equiv 0 \pmod{p^m}$, the claim follows from Kummer's theorem on binomial coefficients (see [2, Appendix 3]). Otherwise, we use the identity

$$\binom{z-1}{p^m-1} = \sum_{k=0}^{p^m-1} (-1)^{p^m-1-k} \binom{z}{k}.$$

If $z \equiv 0 \pmod{p^m}$, then

$$\binom{z}{k} \equiv 0 \pmod{p}, \quad k = 1, \dots, p^m - 1$$

(by Kummer's theorem), which gives what we need. $\square$

3.2. Lemma. Suppose $p \in \mathcal{P}$, $k \in \mathbb{N}$, and $x, y \in \mathbb{Z}$. Then

$$x \equiv y \pmod{p^k} \implies x^p \equiv y^p \pmod{p^{k+1}}.$$

Proof. Indeed,

$$x^p - y^p = (x - y)(x^{p-1} + x^{p-2}y + \dots + y^{p-1}) \equiv 0 \pmod{p^{k+1}}$$

because the first factor is divisible by p^k and the second is divisible by p . $\square$

3.3. Corollary. Suppose $p \in \mathcal{P}$, $n \in \mathbb{N}$, and $x, y \in \mathbb{Z}$. Then

$$x \equiv y \pmod{p} \implies x^{p^{n-1}} \equiv y^{p^{n-1}} \pmod{p^n}.$$

3.4. Lemma. Suppose $p \in \mathcal{P}$, $m, n \in \mathbb{N}$, and $z \in \mathbb{Z}$. Then

$$\binom{z-1}{p^m-1}^{p^{n-1}} \equiv \mathbf{1}_{(p^m)}(z) \pmod{p^n}.$$

Proof. This follows from Lemma 3.1 and Corollary 3.3. $\square$

3.5. Lemma. Suppose $p \in \mathcal{P}$, T is a finite set, and $e : T \rightarrow U$ and $f : T \rightarrow V$ are maps to p -special Abelian groups. If e is injective, then $e \twoheadrightarrow f$.

Proof. For some m and n , we have $p^m U = 0$ and $p^n V = 0$. Put $q := p^m - 1$, $r := p^{n-1}$, and $s := \text{card } T$. We assume that $T = \{1, \dots, s\}$. Put

$$E = \{x \in \langle \underline{T} \rangle : \bar{x} = 1\}.$$

For $k \in \mathbb{N}$ we introduce the homomorphism

$$b_k : \mathbb{Z} \oplus \mathbb{Z} \rightarrow \mathbb{Q}, \quad b_k(v, z) := z/k - v.$$

Let

$$b = \bigotimes_{k=1}^q b_k : (\mathbb{Z} \oplus \mathbb{Z})^{\otimes q} \rightarrow \mathbb{Q}^{\otimes q} = \mathbb{Q}.$$

For $z \in \mathbb{Z}$ we have

$$b((1, z)^{\otimes q}) = \prod_{k=1}^q \left(\frac{z}{k} - 1 \right) = \binom{z-1}{q}.$$

Put

$$B = b^{\otimes r} : (\mathbb{Z} \oplus \mathbb{Z})^{\otimes qr} = ((\mathbb{Z} \oplus \mathbb{Z})^{\otimes q})^{\otimes r} \rightarrow \mathbb{Q}^{\otimes r} = \mathbb{Q}.$$

For $z \in \mathbb{Z}$, Lemma 3.4 implies

$$B((1, z)^{\otimes qr}) = \binom{z-1}{q}^r \equiv \mathbf{1}_{(p^m)}(z) \pmod{p^n}.$$

For $t \in T$, consider the homomorphism

$$c^t : \langle \underline{T} \rangle \rightarrow \mathbb{Z}, \quad \underline{t} \mapsto 1, \quad \underline{z} \mapsto 0, \quad z \in T \setminus \{t\}.$$

For $a \in E$ and $t \in T$ we introduce the homomorphism

$$l_a^t : \langle \underline{T} \rangle \rightarrow \mathbb{Z} \oplus \mathbb{Z}, \quad x \mapsto (\overline{x}, c^t(x) - c^t(a)\overline{x})$$

and put

$$D_a^t = B \circ (l_a^t)^{\otimes qr} : \langle \underline{T} \rangle^{\otimes qr} \rightarrow \mathbb{Q}.$$

If $a \in E$, $t \in T$, and $x \in E$, then

$$\begin{aligned} D_a^t(x^{\otimes qr}) &= B((l_a^t)^{\otimes qr}(x^{\otimes qr})) = B(l_a^t(x)^{\otimes qr}) \\ &= B((1, c^t(x) - c^t(a))^{\otimes qr}) \in \mathbf{1}_{(p^m)}(c^t(x) - c^t(a)) + p^n \mathbb{Z}. \end{aligned}$$

For $a \in E$, let

$$D_a = \bigotimes_{t=1}^s D_a^t : \langle \underline{T} \rangle^{\otimes qrs} = (\langle \underline{T} \rangle^{\otimes qr})^{\otimes s} \rightarrow \mathbb{Q}^{\otimes s} = \mathbb{Q}.$$

For $a, x \in E$ we have

$$D_a(x^{\otimes qrs}) = \prod_{t=1}^s D_a^t(x^{\otimes qr}) \in \mathbf{1}_{p^m \langle \underline{T} \rangle}(x - a) + p^n \mathbb{Z}.$$

Let $P \subset \langle \underline{T} \rangle^{\otimes qrs}$ be the subgroup generated by the elements $x^{\otimes qrs}$, $x \in E$. For $a \in E$ we denote

$$d_a := D_a| : P \rightarrow \mathbb{Z}$$

$(D_a(P) \subset \mathbb{Z})$. If $a, x \in E$, then

$$d_a(x^{\otimes qrs}) \equiv \mathbf{1}_{p^m \langle \underline{T} \rangle}(x - a) \pmod{p^n}.$$

There is a set $A \subset E$ such that for any $x \in E$ there exists a unique $a \in A$ such that $x - a \in p^m \langle \underline{T} \rangle$. The set A is finite.

We introduce the homomorphism

$$K : P \rightarrow V, \quad K(Z) := \sum_{t \in T, a \in A \cap t^e} d_a(Z) f(t),$$

and take an arbitrary $t_0 \in T$. Let $x_0 \in t_0^e$. Since $p^n V = 0$, it follows that

$$K(x_0^{\otimes qrs}) = \sum_{t \in T, a \in A \cap t^e} d_a(x_0^{\otimes qrs}) f(t) = \sum_{t \in T, a \in A \cap t^e} \mathbf{1}_{p^m \langle \underline{T} \rangle}(x_0 - a) f(t).$$

There is $a_0 \in A$ such that $x_0 - a_0 \in p^m \langle \underline{T} \rangle$.

Since $a_0 \in A \subset E$, we see that $\overline{a_0} = 1$. Next, we have $p^m U = 0$; consequently, $e^+(a_0) = e^+(x_0) = e(t_0)$. Therefore, $a_0 \in A \cap t_0^e$. In the last-written sum the term with $t = t_0$ and $a = a_0$ is equal to $f(t_0)$, because $x_0 - a_0 \in p^m \langle \underline{T} \rangle$. There are no other terms with $a = a_0$, because if $t \neq t_0$, then $a_0 \notin t^e$ (recall that $e^+(a_0) = e(t_0) \neq e(t)$ since e is injective). The terms with $a \neq a_0$ are zero because $x_0 - a_0 \in p^m \langle \underline{T} \rangle$; consequently,

$x_0 - a \notin p^m \langle \underline{T} \rangle$ (since $a_0, a \in A$ and $a \neq a_0$). Therefore, $K(x_0^{\otimes qrs}) = f(t_0)$. It follows that $e \xrightarrow{qrs} f$. $\square$

§4. THE MAP $z_{\mathbf{T}}$

Notation. Suppose $\mathbf{T}$ is a simplicial set,

$$c: \prod_{q=0}^{\infty} \Delta^q \times \mathbf{T}_q \rightarrow |\mathbf{T}|$$

is the natural projection, $q \in \mathbb{N}_0$, and $z \in \Delta^q$. Consider the map

$$z_{\mathbf{T}}: \mathbf{T}_q \rightarrow |\mathbf{T}|, \quad t \mapsto z_t := c(z, t).$$

Notation. For $q \in \mathbb{N}_0$ and $i \in [q]$, we put $\tau_i^q = (0, \dots, 0, 1, \dots, 1) \in \Delta^q$ (i zeroes). For $q, r \in \mathbb{N}_0$ and an increasing map $d: [r] \rightarrow [q]$, we introduce the following affine map:

$$d_*: \Delta^r \rightarrow \Delta^q, \quad \tau_j^r \mapsto \tau_{d(j)}^q, \quad j \in [r].$$

4.1. Lemma. *Suppose $z \in \text{Int } \Delta^q$. Then $z_{\mathbf{T}}$ is injective.*

Proof. We take arbitrary $t, t' \in \mathbf{T}_q$ with $z_t = z_{t'}$ and show that $t = t'$. There exist $r \in \mathbb{N}_0$, $w \in \Delta^r$, and increasing maps $d, d': [r] \rightarrow [q]$ such that $\mathbf{T}(d)(t) = \mathbf{T}(d')(t')$ and $d_*(w) = d'_*(w) = z$ (see [1, I.2.13]). Put $E = \{j \in [r] : d(j) = d'(j)\}$. It is not difficult to realize that the relation $d_*(w) = d'_*(w)$ implies that w belongs to the convex hull of the vertices τ_j^r , $j \in E$. Since $d_*(w) = z \in \text{Int } \Delta^q$, $d|_E$ is surjective. Thus, there exists an increasing map $c: [q] \rightarrow [r]$ such that $c([q]) \subset E$, $d \circ c = \text{id}_{[q]}$; consequently, $d' \circ c = \text{id}_{[q]}$. We have

$$t = \mathbf{T}(c)(\mathbf{T}(d)(t)) = \mathbf{T}(c)(\mathbf{T}(d')(t')) = t'. \quad \square$$

4.2. Lemma. *Suppose $\mathbf{T}$ is a simplicial set and $D \subset |\mathbf{T}|$ is a finite set. Then there exist $q \in \mathbb{N}_0$ and $z \in \text{Int } \Delta^q$ such that $D \subset z_{\mathbf{T}}(\mathbf{T}_q)$.*

Proof. For $m \in \mathbb{N}_0$ and $u = (u_1, \dots, u_m) \in \Delta^m$, we put $\|u\| = \{0, u_1, \dots, u_m, 1\} \subset I$. If $\|u\| \subset \|v\|$ for some $u \in \Delta^m$, $v \in \Delta^n$ ($m, n \in \mathbb{N}_0$), then there exists an increasing map $d: [n] \rightarrow [m]$ such that $u = d_*(v)$, and $u_t = v_{\mathbf{T}(d)(t)} \in v_{\mathbf{T}}(\mathbf{T}_n)$ for any $t \in \mathbf{T}_m$. Thus, it suffices to choose z with $\|z\|$ sufficiently large. Namely, each point of D is y_t for some $y \in \Delta^p$ and $t \in \mathbf{T}_p$ ($p \in \mathbb{N}_0$), and we require that $\|y\| \subset \|z\|$. $\square$

§5. SIMPLICIAL ABELIAN GROUPS

Commonplaces. Suppose $\mathbf{U}$ is a simplicial Abelian group. Then $|\mathbf{U}|$ is an Abelian group with weakly continuous addition and subtraction. For $q \in \mathbb{N}_0$ and $z \in \Delta^q$, the map $z_{\mathbf{U}}: \mathbf{U}_q \rightarrow |\mathbf{U}|$ is a homomorphism. For $q \in \mathbb{N}_0$, the set $\Pi_q |\mathbf{U}|$ is an Abelian group.

5.1. Lemma. *Suppose $m \in \mathbb{N}_0$, and $\mathbf{U}$ is a simplicial Abelian group. Then*

$$J = J_{m, |\mathbf{U}|} \xrightarrow{1} \text{id}_{\Pi_m |\mathbf{U}|}.$$

Proof. Let $j: \Pi_m |\mathbf{U}| \rightarrow \Phi_m |\mathbf{U}|$ be the inclusion homomorphism. Consider the homomorphisms

$$r: \langle |\mathbf{U}| \rangle \rightarrow |\mathbf{U}|, \quad 'v' \mapsto v, \quad v \in |\mathbf{U}|,$$

and

$$h: \Psi_m |\mathbf{U}| \rightarrow \Phi_m |\mathbf{U}|, \quad h(w)(z) := r(w('z')), \quad z \in S^m.$$

We have $h \circ J = j$ because

$$h(J(a))(z) = h(\langle a \rangle)(z) = r(\langle a \rangle('z')) = r('a(z)') = a(z) = j(a)(z)$$

for any $a \in \Pi_m |\mathbf{U}|$ and $z \in S^m$. By assertion a) of Lemma 2.2, $J \xrightarrow{1} h \circ J = j$. By assertion b) of Lemma 2.2, $j \xrightarrow{1} \text{id}$. Therefore, $J \xrightarrow{1} \text{id}$ by Lemma 2.3. $\square$

5.2. Lemma. Suppose $m \in \mathbb{N}$ and $\mathbf{U}$ is a simplicial Abelian group. Then the main map $P: \Pi_m|\mathbf{U}| \rightarrow \pi_m|\mathbf{U}|$ is a homomorphism.

See [3, Lecture 4, Supplement, Proposition 5].

§6. COMPARISON OF SIMPLICIAL MAPS

Definition. Suppose $\mathbf{T}$ is a simplicial set, $\mathbf{U}$ and $\mathbf{V}$ are simplicial Abelian groups, and $\mathbf{e}: \mathbf{T} \rightarrow \mathbf{U}$ and $\mathbf{f}: \mathbf{T} \rightarrow \mathbf{V}$ are simplicial maps. For $r \in \mathbb{N}_0$ we write $\mathbf{e} \xrightarrow{r} \mathbf{f}$ if $\mathbf{e}_q \xrightarrow{r} \mathbf{f}_q$ for every $q \in \mathbb{N}_0$. We write $\mathbf{e} \rightarrow \mathbf{f}$ if there exists $r \in \mathbb{N}_0$ such that $\mathbf{e} \xrightarrow{r} \mathbf{f}$.

6.1. Lemma. If $\mathbf{e} \xrightarrow{r} \mathbf{f}$, then $|\mathbf{e}| \xrightarrow{r} |\mathbf{f}|$.

Proof. Let $D \subset |\mathbf{T}|$ be an arbitrary finite set, and let $j: D \rightarrow |\mathbf{T}|$ be the inclusion. By Lemma 4.2, there exist $q \in \mathbb{N}_0$ and $z \in \text{Int } \Delta^q$ such that $D \subset z_{\mathbf{T}}(\mathbf{T}_q)$. There exists a map $s: D \rightarrow \mathbf{T}_q$ such that $z_{\mathbf{T}} \circ s = j$. Consider the commutative diagram

$$\begin{array}{ccccc} \mathbf{U}_q & \xleftarrow{\mathbf{e}_q} & \mathbf{T}_q & \xrightarrow{\mathbf{f}_q} & \mathbf{V}_q \\ z_{\mathbf{U}} \downarrow & & z_{\mathbf{T}} \downarrow & & z_{\mathbf{V}} \downarrow \\ |\mathbf{U}| & \xleftarrow{|\mathbf{e}|} & |\mathbf{T}| & \xrightarrow{|\mathbf{f}|} & |\mathbf{V}|. \end{array}$$

The maps $z_{\mathbf{U}}$ and $z_{\mathbf{V}}$ are homomorphisms. We have

$$|\mathbf{e}| \circ z_{\mathbf{T}} = z_{\mathbf{U}} \circ \mathbf{e}_q \xrightarrow{1} \mathbf{e}_q$$

by assertion b) of Lemma 2.2, because $z_{\mathbf{U}}$ is a monomorphism by Lemma 4.1. By assumption, $\mathbf{e}_q \xrightarrow{r} \mathbf{f}_q$. By assertion a) of Lemma 2.2, $\mathbf{f}_q \xrightarrow{1} z_{\mathbf{V}} \circ \mathbf{f}_q = |\mathbf{f}| \circ z_{\mathbf{T}}$. Therefore, $|\mathbf{e}| \circ z_{\mathbf{T}} \xrightarrow{r} |\mathbf{f}| \circ z_{\mathbf{T}}$ by Lemma 2.3. Lemma 2.4 shows that

$$|\mathbf{e}| \circ j = |\mathbf{e}| \circ z_{\mathbf{T}} \circ s \xrightarrow{r} |\mathbf{f}| \circ z_{\mathbf{T}} \circ s = |\mathbf{f}| \circ j.$$

Therefore, $|\mathbf{e}| \xrightarrow{r} |\mathbf{f}|$ by Lemma 2.5. $\square$

6.2. Corollary. Under the assumptions of Lemma 6.1, $\Pi_m|\mathbf{e}| \xrightarrow{r} \Pi_m|\mathbf{f}|$ for every $m \in \mathbb{N}_0$.

Proof. Consider the commutative diagram

$$\begin{array}{ccccc} \Pi_m|\mathbf{U}| & \xleftarrow{\Pi_m|\mathbf{e}|} & \Pi_m|\mathbf{T}| & \xrightarrow{\Pi_m|\mathbf{f}|} & \Pi_m|\mathbf{V}| \\ j' \downarrow & & j \downarrow & & j'' \downarrow \\ \Phi_m|\mathbf{U}| & \xleftarrow{\Phi_m|\mathbf{e}|} & \Phi_m|\mathbf{T}| & \xrightarrow{\Phi_m|\mathbf{f}|} & \Phi_m|\mathbf{V}|, \end{array}$$

where j , j' , and j'' are inclusions. Clearly, j' and j'' are homomorphisms. By assertion a) of Lemma 2.2,

$$\Pi_m|\mathbf{e}| \xrightarrow{1} j' \circ \Pi_m|\mathbf{e}| = \Phi_m|\mathbf{e}| \circ j.$$

By Lemma 6.1, we have $|\mathbf{e}| \xrightarrow{r} |\mathbf{f}|$. Thus, $\Phi_m|\mathbf{e}| \xrightarrow{r} \Phi_m|\mathbf{f}|$ by Lemma 2.7. Consequently,

$$\Phi_m|\mathbf{e}| \circ j \xrightarrow{r} \Phi_m|\mathbf{f}| \circ j = j'' \circ \Pi_m|\mathbf{f}|$$

by Lemma 2.4. Assertion b) of Lemma 2.2 yields $j'' \circ \Pi_m|\mathbf{f}| \xrightarrow{1} \Pi_m|\mathbf{f}|$. Therefore, $\Pi_m|\mathbf{e}| \xrightarrow{r} \Pi_m|\mathbf{f}|$ by Lemma 2.3. $\square$

§7. THE EILENBERG–MAC LANE CONSTRUCTION

Generalities. Suppose $n \in \mathbb{N}$, and V is an Abelian group. The following objects are well defined (see [10, §23]): the simplicial Abelian groups $\mathbf{K}(V, n) = \mathbf{K}$ and $\mathbf{L}(V, n) = \mathbf{L}$, and a simplicial homomorphism $\mathbf{c}(V, n) = \mathbf{c} : \mathbf{L} \rightarrow \mathbf{K}$. For $q \in \mathbb{N}_0$, $\mathbf{K}_q$ is the group of classical n -cocycles of Δ^q with coefficients in V , $\mathbf{L}_q$ is the group of classical $(n-1)$ -cochains of Δ^q with coefficients in V , and $\mathbf{c}_q$ is the restriction of the coboundary homomorphism.

For $q, r \in \mathbb{N}_0$ and an increasing map $d : [r] \rightarrow [q]$,

$$\mathbf{K}(d) : \mathbf{K}_q \rightarrow \mathbf{K}_r$$

is the homomorphism induced by $d_* : \Delta^r \rightarrow \Delta^q$. The same applies to $\mathbf{L}$. We have $\pi_q|\mathbf{K}| = 0$, $q \in \mathbb{N} \setminus \{n\}$. There is a canonical isomorphism $V \rightarrow \pi_n|\mathbf{K}|$. Composing it with the Hurewicz homomorphism, we get an isomorphism $i : V \rightarrow H_n|\mathbf{K}|$, called the *standard isomorphism*. The space $|\mathbf{L}|$ is contractible. Since the $\mathbf{c}_q$ are epimorphisms for $q \in \mathbb{N}_0$, $\mathbf{c}$ is a Kan fibration by [8, Lemma III.2.8]; consequently, $|\mathbf{c}|$ is a Serre fibration by the Quillen theorem (see [8, Theorem I.10.10]).

7.1. Lemma. *Suppose $n \in \mathbb{N}$, $\mathbf{T}$ is a simplicial pointed set, V is an Abelian group, and $g : H_n|\mathbf{T}| \rightarrow V$ is a homomorphism. Put $\mathbf{K} = \mathbf{K}(V, n)$. Let $i : V \rightarrow H_n|\mathbf{K}|$ be the standard isomorphism. Then there exists a simplicial bound map $\mathbf{f} : \mathbf{T} \rightarrow \mathbf{K}$ such that $H_n|\mathbf{f}| = i \circ g$.*

This follows from the universal coefficient theorem and “the universal cohomology class theorem” (see [10, Theorem 24.4]).

7.2. Lemma. *Suppose $p \in \mathcal{P}$, $\mathbf{T}$ is a simplicial finite pointed set, $\mathbf{U}$ is a simplicial p -special Abelian group, V is a p -special Abelian group, $n \in \mathbb{N}$, $\mathbf{e} : \mathbf{T} \rightarrow \mathbf{U}$ is an embedding, and $\mathbf{f} : \mathbf{T} \rightarrow \mathbf{K}(V, n)$ is a simplicial bound map. Then $\mathbf{e} \rightarrow \mathbf{f}$.*

Proof. Put $\mathbf{K} = \mathbf{K}(V, n)$. By Lemma 3.5, there exists $r \in \mathbb{N}_0$ such that $\mathbf{e}_n \xrightarrow{r} \mathbf{f}_n$. For an arbitrary $q \in \mathbb{N}_0$, we consider the commutative diagram

$$\begin{array}{ccccc} \mathbf{U}_q & \xleftarrow{\mathbf{e}_q} & \mathbf{T}_q & \xrightarrow{\mathbf{f}_q} & \mathbf{K}_q \\ g' \downarrow & & g \downarrow & & h \downarrow \\ \prod_{d \in D} \mathbf{U}_n & \xleftarrow{E=(\mathbf{e}_n)_{d \in D}} & \prod_{d \in D} \mathbf{T}_n & \xrightarrow{F=(\mathbf{f}_n)_{d \in D}} & \prod_{d \in D} \mathbf{K}_n, \end{array}$$

where D is the set of all increasing maps $d : [n] \rightarrow [q]$ and

$$g = \prod_{d \in D} \mathbf{T}(d), \quad g' = \prod_{d \in D} \mathbf{U}(d), \quad h = \prod_{d \in D} \mathbf{K}(d).$$

By assertion a) of Lemma 2.2, $\mathbf{e}_q \xrightarrow{1} g' \circ \mathbf{e}_q = E \circ g$. By Lemma 2.7, $E \xrightarrow{r} F$. Thus, $E \circ g \xrightarrow{r} F \circ g = h \circ \mathbf{f}_q$ by Lemma 2.4. It is not difficult to check that h is a monomorphism. Thus, $h \circ \mathbf{f}_q \xrightarrow{1} \mathbf{f}_q$ by assertion b) of Lemma 2.2. Therefore, $\mathbf{e}_q \xrightarrow{r} \mathbf{f}_q$ by Lemma 2.3. $\square$

§8. APPLYING SERRE’S METHOD

Definition. Let $m \in \mathbb{N}_0$. Suppose we have a commutative diagram

$$(1) \quad \begin{array}{ccc} \tilde{\mathbf{U}} & \xleftarrow{\tilde{\mathbf{e}}} & \tilde{\mathbf{T}} \\ s \downarrow & & r \downarrow \\ \mathbf{U} & \xleftarrow{\mathbf{e}} & \mathbf{T}, \end{array}$$

where $\mathbf{T}$ and $\tilde{\mathbf{T}}$ are simplicial pointed sets, $\mathbf{r}$ is a simplicial bound map, $\mathbf{U}$ and $\tilde{\mathbf{U}}$ are simplicial Abelian groups, $\mathbf{s}$ is a simplicial homomorphism, and $\mathbf{e}$ and $\tilde{\mathbf{e}}$ are embeddings. Consider the commutative diagram

$$\begin{array}{ccc} \Pi_m|\tilde{\mathbf{U}}| & \xleftarrow{\Pi_m|\tilde{\mathbf{e}}|} & \Pi_m|\tilde{\mathbf{T}}| \\ \Pi_m|\mathbf{s}| \downarrow & & \Pi_m|\mathbf{r}| \downarrow \\ \Pi_m|\mathbf{U}| & \xleftarrow{\Pi_m|\mathbf{e}|} & \Pi_m|\mathbf{T}|. \end{array}$$

By a *gear* for diagram (1) we mean a bound map $G: \Pi_m|\mathbf{T}| \rightarrow \Pi_m|\tilde{\mathbf{T}}|$ such that $\Pi_m|\mathbf{r}| \circ G = \text{id}_{\Pi_m|\mathbf{T}|}$ and $\Pi_m|\mathbf{e}| \rightarrow \Pi_m|\tilde{\mathbf{e}}| \circ G$.

8.1. Claim. Suppose $p \in \mathcal{P}$, $m, n \in \mathbb{N}$, and we are given a commutative diagram

$$(2) \quad \begin{array}{ccccc} \tilde{\mathbf{U}} & \xleftarrow{\tilde{\mathbf{e}}} & \tilde{\mathbf{T}} & \xrightarrow{\mathbf{g}} & \mathbf{L} \\ \mathbf{s} \downarrow & & \mathbf{r} \downarrow & & \mathbf{c} \downarrow \\ \mathbf{U} & \xleftarrow{\mathbf{e}} & \mathbf{T} & \xrightarrow{\mathbf{f}} & \mathbf{K}, \end{array}$$

where $\mathbf{T}$ is a simplicial finite pointed set, $\mathbf{U}$ is a simplicial p -special Abelian group, $\mathbf{e}$ is an embedding, $\mathbf{f}$ is a simplicial bound map, $\mathbf{K} = \mathbf{K}(\mathbb{Z}_p, n)$, $\mathbf{L} = \mathbf{L}(\mathbb{Z}_p, n)$, $\mathbf{c} = \mathbf{c}(\mathbb{Z}_p, n)$, $\tilde{\mathbf{T}}$ is a simplicial pointed set, $\mathbf{r}$ and $\mathbf{g}$ are simplicial bound maps, the right square is Cartesian, $\tilde{\mathbf{U}} = \mathbf{U} \times \mathbf{L}$, $\mathbf{s}$ is the projection, and $\tilde{\mathbf{e}} = (\mathbf{e} \circ \mathbf{r}) \times \mathbf{g}$. Suppose $m \neq n$. Then there exists a gear $G: \Pi_m|\mathbf{T}| \rightarrow \Pi_m|\tilde{\mathbf{T}}|$ for the left square of diagram (2).

Proof. Consider the commutative diagram

$$(3) \quad \begin{array}{ccccccc} \Pi_m|\mathbf{U}| \times \Pi_m|\mathbf{L}| & \xleftarrow{\Pi_m|\mathbf{s}| \times \Pi_m|\mathbf{t}|} & \Pi_m|\tilde{\mathbf{U}}| & \xleftarrow{\Pi_m|\tilde{\mathbf{e}}|} & \Pi_m|\tilde{\mathbf{T}}| & \xrightarrow{\Pi_m|\mathbf{g}|} & \Pi_m|\mathbf{L}| \\ \Pi_m|\mathbf{s}| \downarrow & & \Pi_m|\mathbf{r}| \downarrow & & \Pi_m|\mathbf{c}| \downarrow & & \\ \Pi_m|\mathbf{U}| & \xleftarrow{\Pi_m|\mathbf{e}|} & \Pi_m|\mathbf{T}| & \xrightarrow{\Pi_m|\mathbf{f}|} & \Pi_m|\mathbf{K}|, \end{array}$$

where $\mathbf{t}: \tilde{\mathbf{U}} \rightarrow \mathbf{L}$ is the projection.

We have $p\mathbf{K}_q = 0$ for every $q \in \mathbb{N}_0$. Therefore, $p|\mathbf{K}| = 0$, whence $p\Pi_m|\mathbf{K}| = 0$. Similarly, $p\Pi_m|\mathbf{L}| = 0$. Thus, we can view $\Pi_m|\mathbf{K}|$ and $\Pi_m|\mathbf{L}|$ as vector spaces over the field $\mathbb{Z}_p$, and $\Pi_m|\mathbf{c}|$ as a linear map. Since $\pi_m|\mathbf{K}| = 0$ and $|\mathbf{c}|$ is a Serre fibration, $\Pi_m|\mathbf{c}|$ is surjective. Hence, there exists a linear map $F: \Pi_m|\mathbf{K}| \rightarrow \Pi_m|\mathbf{L}|$ such that $\Pi_m|\mathbf{c}| \circ F = \text{id}_{\Pi_m|\mathbf{K}|}$.

Since the right square of diagram (2) is Cartesian, so is the right square of diagram (3). We define the required map

$$G: \Pi_m|\mathbf{T}| \rightarrow \Pi_m|\tilde{\mathbf{T}}|$$

by the conditions $\Pi_m|\mathbf{r}| \circ G = \text{id}_{\Pi_m|\mathbf{T}|}$ and $\Pi_m|\mathbf{g}| \circ G = F \circ \Pi_m|\mathbf{f}|$ (compatibility: $\Pi_m|\mathbf{f}| = \Pi_m|\mathbf{c}| \circ F \circ \Pi_m|\mathbf{f}|$).

By assertion a) of Lemma 2.2, we see that

$$\Pi_m|\mathbf{e}| \xrightarrow{1} \Pi_m|\mathbf{e}| = \Pi_m|\mathbf{e}| \circ \Pi_m|\mathbf{r}| \circ G = \Pi_m|\mathbf{s}| \circ \Pi_m|\tilde{\mathbf{e}}| \circ G.$$

Lemma 7.2 and Corollary 6.2 imply $\Pi_m|\mathbf{e}| \rightarrow \Pi_m|\mathbf{f}|$. Assertion a) of Lemma 2.2 shows that $\Pi_m|\mathbf{f}| \xrightarrow{1} F \circ \Pi_m|\mathbf{f}|$. Thus, by Lemma 2.3,

$$\Pi_m|\mathbf{e}| \rightarrow F \circ \Pi_m|\mathbf{f}| = \Pi_m|\mathbf{g}| \circ G = \Pi_m|\mathbf{t}| \circ \Pi_m|\tilde{\mathbf{e}}| \circ G.$$

Therefore,

$$\Pi_m|\mathbf{e}| \rightarrow (\Pi_m|\mathbf{s}| \times \Pi_m|\mathbf{t}|) \circ \Pi_m|\tilde{\mathbf{e}}| \circ G$$

by Lemmas 2.1 and 2.6. Since $\Pi_m|\mathbf{s}| \times \Pi_m|\mathbf{t}|$ is an isomorphism, $\Pi_m|\mathbf{e}| \rightarrow \Pi_m|\tilde{\mathbf{e}}| \circ G$. $\square$

8.2. Claim. Suppose $p \in \mathcal{P}$, $m \in \mathbb{N}$, $\mathbf{T}$ is a simply connected simplicial finite pointed set, $\mathbf{U}$ is a simplicial p -special Abelian group, and $\mathbf{e} : \mathbf{T} \rightarrow \mathbf{U}$ is an embedding. Suppose the groups $\pi_q|\mathbf{T}|$, $q \in \mathbb{N}$, are p -special. Then there exists a commutative diagram of the form (1), where $\tilde{\mathbf{T}}$ is an $(m-1)$ -connected simplicial finite pointed set and $\tilde{\mathbf{U}}$ is a simplicial p -special Abelian group, and a gear $G : \Pi_m|\mathbf{T}| \rightarrow \Pi_m|\tilde{\mathbf{T}}|$ for that diagram.

Proof. We proceed in a finite number of steps. At the i th ($i \in \mathbb{N}_0$) step we shall construct a commutative diagram

$$\begin{array}{ccc} \tilde{\mathbf{U}}^i & \xleftarrow{\tilde{\mathbf{e}}^i} & \tilde{\mathbf{T}}^i \\ \mathbf{s}^i \downarrow & & \mathbf{r}^i \downarrow \\ \mathbf{U} & \xleftarrow{\mathbf{e}} & \mathbf{T}, \end{array}$$

where $\tilde{\mathbf{T}}^i$ is a simply connected simplicial finite pointed set such that the groups $\pi_q|\tilde{\mathbf{T}}^i|$, $q \in \mathbb{N}$, are p -special, $\mathbf{r}^i$ is a simplicial bound map, $\tilde{\mathbf{U}}^i$ is a simplicial p -special Abelian group, $\mathbf{s}^i$ is a simplicial homomorphism, and $\tilde{\mathbf{e}}^i$ is an embedding, together with a gear $G^i : \Pi_m|\mathbf{T}| \rightarrow \Pi_m|\tilde{\mathbf{T}}^i|$ for that diagram.

The 0th step: we put

$$\tilde{\mathbf{T}}^0 = \mathbf{T}, \quad \mathbf{r}^0 = \text{id}, \quad \tilde{\mathbf{U}}^0 = \mathbf{U}, \quad \mathbf{s}^0 = \text{id}, \quad \tilde{\mathbf{e}}^0 = \mathbf{e}, \quad G^0 = \text{id}.$$

Suppose that the i th ($i \in \mathbb{N}_0$) step is finished. If the simplicial set $\tilde{\mathbf{T}}^i$ is $(m-1)$ -connected, we put

$$\tilde{\mathbf{T}} = \tilde{\mathbf{T}}^i, \quad \mathbf{r} = \mathbf{r}^i, \quad \tilde{\mathbf{U}} = \tilde{\mathbf{U}}^i, \quad \mathbf{s} = \mathbf{s}^i, \quad \tilde{\mathbf{e}} = \tilde{\mathbf{e}}^i, \quad G = G^i,$$

and we are done. Otherwise, we pass to the $(i+1)$ st step. Put

$$n = \inf\{q \in \mathbb{N} : \pi_q|\tilde{\mathbf{T}}^i| \neq 0\}.$$

Then $n < m$. Let

$$\mathbf{K} = \mathbf{K}(\mathbb{Z}_p, n), \quad \mathbf{L} = \mathbf{L}(\mathbb{Z}_p, n), \quad \mathbf{c} = \mathbf{c}(V, n) : \mathbf{L} \rightarrow \mathbf{K}.$$

Since $\pi_n|\tilde{\mathbf{T}}^i|$ is a nonzero p -special Abelian group, there exists an epimorphism $h : \pi_n|\tilde{\mathbf{T}}^i| \rightarrow \mathbb{Z}_p$. By the Hurewicz theorem and Lemma 7.1, there exists a simplicial bound map $\mathbf{f} : \tilde{\mathbf{T}}^i \rightarrow \mathbf{K}$ such that $\pi_n|\mathbf{f}|$ is an epimorphism. There is a commutative diagram

$$(4) \quad \begin{array}{ccccc} \tilde{\mathbf{U}}^{i+1} & \xleftarrow{\tilde{\mathbf{e}}^{i+1}} & \tilde{\mathbf{T}}^{i+1} & \xrightarrow{\mathbf{g}} & \mathbf{L} \\ \mathbf{s}' \downarrow & & \mathbf{r}' \downarrow & & \mathbf{c} \downarrow \\ \tilde{\mathbf{U}}^i & \xleftarrow{\tilde{\mathbf{e}}^i} & \tilde{\mathbf{T}}^i & \xrightarrow{\mathbf{f}} & \mathbf{K}, \end{array}$$

where $\tilde{\mathbf{T}}^{i+1}$ is a simplicial pointed set, $\mathbf{r}'$ and $\mathbf{g}$ are simplicial bound maps, the right square is Cartesian, $\tilde{\mathbf{U}}^{i+1} = \tilde{\mathbf{U}}^i \times \mathbf{L}$, $\mathbf{s}'$ is the projection, and $\tilde{\mathbf{e}}^{i+1} = (\tilde{\mathbf{e}}^i \circ \mathbf{r}') \times \mathbf{g}$. Putting $\mathbf{r}^{i+1} = \mathbf{r}^i \circ \mathbf{r}'$ and $\mathbf{s}^{i+1} = \mathbf{s}^i \circ \mathbf{s}'$, we get the required commutative diagram

$$(5) \quad \begin{array}{ccc} \tilde{\mathbf{U}}^{i+1} & \xleftarrow{\tilde{\mathbf{e}}^{i+1}} & \tilde{\mathbf{T}}^{i+1} \\ \mathbf{s}^{i+1} \downarrow & & \mathbf{r}^{i+1} \downarrow \\ \mathbf{U} & \xleftarrow{\mathbf{e}} & \mathbf{T}. \end{array}$$

By Claim 8.1, there exists a gear $G' : \Pi_m|\tilde{\mathbf{T}}^i| \rightarrow \Pi_m|\tilde{\mathbf{T}}^{i+1}|$ for the left square of diagram (4). Put $G^{i+1} = G' \circ G^i$. Clearly, $\Pi_m|\mathbf{r}^{i+1}| \circ G^i = \text{id}$. Consider the diagram

$$\begin{array}{ccc} \Pi_m|\tilde{\mathbf{U}}^{i+1}| & \xleftarrow{\Pi_m|\tilde{\mathbf{e}}^{i+1}|} & \Pi_m|\tilde{\mathbf{T}}^{i+1}| \\ & & \uparrow G' \\ \Pi_m|\tilde{\mathbf{U}}^i| & \xleftarrow{\Pi_m|\tilde{\mathbf{e}}^i|} & \Pi_m|\tilde{\mathbf{T}}^i| \\ & & \uparrow G^i \\ \Pi_m|\mathbf{U}| & \xleftarrow{\Pi_m|\mathbf{e}|} & \Pi_m|\mathbf{T}|. \end{array}$$

We have

$$\Pi_m|\mathbf{e}| \rightarrow \Pi_m|\tilde{\mathbf{e}}^i| \circ G^i, \quad \Pi_m|\tilde{\mathbf{e}}^i| \rightarrow \Pi_m|\tilde{\mathbf{e}}^{i+1}| \circ G'.$$

Consequently, by Lemma 2.4,

$$\Pi_m|\tilde{\mathbf{e}}^i| \circ G^i \rightarrow \Pi_m|\tilde{\mathbf{e}}^{i+1}| \circ G' \circ G^i = \Pi_m|\tilde{\mathbf{e}}^{i+1}| \circ G^{i+1}.$$

Thus, $\Pi_m|\mathbf{e}| \rightarrow \Pi_m|\tilde{\mathbf{e}}^{i+1}| \circ G^{i+1}$ by Lemma 2.3. Therefore, G^{i+1} is a gear for diagram (5). Since the right square of diagram (4) is Cartesian and $|\mathbf{c}|$ is a Serre fibration, $|\mathbf{r}'|$ is also a Serre fibration, and $|\mathbf{g}|$ maps the fibers of $|\mathbf{r}'|$ homeomorphically to those of $|\mathbf{c}|$. Comparing the homotopy sequences of the fibrations $|\mathbf{r}'|$ and $|\mathbf{c}|$, we see that $\pi_q|\mathbf{r}'|$ is an isomorphism for $q \neq n$ and a monomorphism with cokernel of order p for $q = n$. Since the groups $\pi_q|\tilde{\mathbf{T}}^i|$, $q \in \mathbb{N}$, are p -special, so are the groups $\pi_q|\tilde{\mathbf{T}}^{i+1}|$, $q \in \mathbb{N}$. The step is completed.

We see that the order of the direct sum of the groups $\pi_q|\tilde{\mathbf{T}}^i|$, $q < m$, strictly decreases at each step. Thus, we shall stop at some step. $\square$

8.3. Claim. Suppose $p \in \mathcal{P}$, $m \in \mathbb{N}$, $\mathbf{T}$ is a simplicial finite pointed set, $\mathbf{U}$ is a simplicial p -special Abelian group, $\mathbf{e} : \mathbf{T} \rightarrow \mathbf{U}$ is an embedding, V is a p -special Abelian group, and $g : H_m|\mathbf{T}| \rightarrow V$ is a homomorphism. Then $\Pi_m|\mathbf{e}| \rightarrow g \circ \text{Hur}_{m,|\mathbf{T}|} \circ P_{m,|\mathbf{T}|}$.

Proof. Put $\mathbf{K} = \mathbf{K}(V, m)$. Let $i : V \rightarrow H_m|\mathbf{K}|$ be the standard isomorphism. By Lemma 7.1, there exists a simplicial bound map $\mathbf{f} : \mathbf{T} \rightarrow \mathbf{K}$ such that $H_m|\mathbf{f}| = i \circ g$. Consider the commutative diagram

$$\begin{array}{ccccccc} \Pi_m|\mathbf{U}| & \xleftarrow{\Pi_m|\mathbf{e}|} & \Pi_m|\mathbf{T}| & \xrightarrow{P} & \pi_m|\mathbf{T}| & \xrightarrow{h} & H_m|\mathbf{T}| \\ & & \downarrow \Pi_m|\mathbf{f}| & & \downarrow \pi_m|\mathbf{f}| & & \downarrow H_m|\mathbf{f}| \\ & & \Pi_m|\mathbf{K}| & \xrightarrow{P'} & \pi_m|\mathbf{K}| & \xrightarrow{h'} & H_m|\mathbf{K}| \xleftarrow{i} V, \end{array}$$

where $h = \text{Hur}_{m,|\mathbf{T}|}$ and $h' = \text{Hur}_{m,|\mathbf{K}|}$. From Lemma 7.2 and Corollary 6.2 it follows that $\Pi_m|\mathbf{e}| \rightarrow \Pi_m|\mathbf{f}|$. By Lemma 5.2, P' is a homomorphism. Assertion a) of Lemma 2.2 shows that

$$\Pi_m|\mathbf{f}| \xrightarrow{1} h' \circ P' \circ \Pi_m|\mathbf{f}| = H_m|\mathbf{f}| \circ h \circ P = i \circ g \circ h \circ P.$$

Since i is an isomorphism, $\Pi_m|\mathbf{f}| \xrightarrow{1} g \circ h \circ P$. Therefore, $\Pi_m|\mathbf{e}| \rightarrow g \circ h \circ P$ by Lemma 2.3. $\square$

8.4. Claim. Under the assumptions of Claim 8.2, $\Pi_m|\mathbf{e}| \rightarrow P_{m,|\mathbf{T}|}$.

Proof. We apply Claim 8.2 and consider the commutative diagram

$$\begin{array}{ccccc} \Pi_m|\tilde{\mathbf{U}}| & \xleftarrow{\Pi_m|\tilde{\mathbf{e}}|} & \Pi_m|\tilde{\mathbf{T}}| & \xrightarrow{\tilde{P}} & \pi_m|\tilde{\mathbf{T}}| & \xrightarrow{\tilde{h}} & H_m|\tilde{\mathbf{T}}| \\ \Pi_m|\mathbf{s}| \downarrow & & \Pi_m|\mathbf{r}| \downarrow & & \pi_m|\mathbf{r}| \downarrow & & \\ \Pi_m|\mathbf{U}| & \xleftarrow{\Pi_m|\mathbf{e}|} & \Pi_m|\mathbf{T}| & \xrightarrow{P} & \pi_m|\mathbf{T}|, & & \end{array}$$

where $\tilde{h} = \text{Hur}_{m,|\tilde{\mathbf{T}}|}$. By the Hurewicz theorem, $\tilde{h}$ is an isomorphism. We have $\Pi_m|\mathbf{e}| \rightarrow \Pi_m|\tilde{\mathbf{e}}| \circ G$. By Claim 8.3,

$$\Pi_m|\tilde{\mathbf{e}}| \rightarrow \pi_m|\mathbf{r}| \circ \tilde{h}^{-1} \circ \tilde{h} \circ \tilde{P} = \pi_m|\mathbf{r}| \circ \tilde{P} = P \circ \Pi_m|\mathbf{r}|.$$

Thus, by Lemma 2.4,

$$\Pi_m|\tilde{\mathbf{e}}| \circ G \rightarrow P \circ \Pi_m|\mathbf{r}| \circ G = P.$$

Therefore, $\Pi_m|\tilde{\mathbf{e}}| \rightarrow P$ by Lemma 2.3. $\square$

8.5. Claim. Suppose $p \in \mathcal{P}$, $m \in \mathbb{N}$, and $\mathbf{T}$ is a simply connected simplicial finite pointed set. If the groups $\pi_q|\mathbf{T}|$, $q \in \mathbb{N}$, are p -special, then $J_{m,|\mathbf{T}|} \rightarrow P_{m,|\mathbf{T}|}$.

Proof. Let $\mathbf{U}$ be the simplicial Abelian group with $\mathbf{U}_q = \langle \mathbf{T}_q \rangle / p$, $q \in \mathbb{N}_0$, and $\mathbf{U}(d) = \langle \mathbf{T}(d) \rangle / p$ for an increasing map $d: [r] \rightarrow [q]$ ($q, r \in \mathbb{N}_0$). We introduce the embedding

$$\mathbf{e}: \mathbf{T} \rightarrow \mathbf{U}, \quad \mathbf{e}_q(t) := \langle t \rangle_p, \quad t \in \mathbf{T}_q, \quad q \in \mathbb{N}_0,$$

and consider the commutative diagram

$$\begin{array}{ccc} \Psi_m|\mathbf{T}| & \xleftarrow{J} & \Pi_m|\mathbf{T}| & \xrightarrow{P} & \pi_m|\mathbf{T}| \\ \Psi_m|\mathbf{e}| \downarrow & & \Pi_m|\mathbf{e}| \downarrow & & \\ \Psi_m|\mathbf{U}| & \xleftarrow{J'} & \Pi_m|\mathbf{U}|. & & \end{array}$$

By assertion a) of Lemma 2.2, $J \xrightarrow{\perp} \Psi_m|\mathbf{e}| \circ J = J' \circ \Pi_m|\mathbf{e}|$. By Lemma 5.1, $J' \xrightarrow{\perp} \text{id}$. Thus, $J' \circ \Pi_m|\mathbf{e}| \xrightarrow{\perp} \Pi_m|\mathbf{e}|$ by Lemma 2.4. Claim 8.4 implies $\Pi_m|\mathbf{e}| \rightarrow P$. Therefore, $J \rightarrow P$ by Lemma 2.3. $\square$

§9. THE MOST NONCONSTRUCTIVE SITE

9.1. Lemma. Suppose $p \in \mathcal{P}$, $m \in \mathbb{N}$, $\mathbf{T}$ is a simply connected simplicial pointed set, W is a p -special Abelian group, and $r: \pi_m|\mathbf{T}| \rightarrow W$ is a homomorphism. If the groups $\pi_q|\mathbf{T}|$, $q \in \mathbb{N}$, are finitely generated, then there exists a simply connected simplicial finite pointed set $\mathbf{T}'$, a homomorphism $r': \pi_m|\mathbf{T}'| \rightarrow W$, and a simplicial bound map $\mathbf{h}: \mathbf{T} \rightarrow \mathbf{T}'$ such that $r' \circ \pi_m|\mathbf{h}| = r$ and the groups $\pi_q|\mathbf{T}'|$, $q \in \mathbb{N}$, are p -special.

This follows from the results of [7] (see §15 below).

9.2. Claim. Under the assumptions of Lemma 9.1, $J_{m,|\mathbf{T}|} \rightarrow r \circ P_{m,|\mathbf{T}|}$.

Proof. By Lemma 9.1, there exists a simply connected finite pointed set $\mathbf{T}'$, a homomorphism $r': \pi_m|\mathbf{T}'| \rightarrow W$, and a simplicial bound map $\mathbf{h}: \mathbf{T} \rightarrow \mathbf{T}'$ such that $r' \circ \pi_m|\mathbf{h}| = r$ and the groups $\pi_q|\mathbf{T}'|$, $q \in \mathbb{N}$, are p -special. Consider the commutative diagram

$$\begin{array}{ccccccc} \Psi_m|\mathbf{T}| & \xleftarrow{J} & \Pi_m|\mathbf{T}| & \xrightarrow{P} & \pi_m|\mathbf{T}| & & \\ \Psi_m|\mathbf{h}| \downarrow & & \Pi_m|\mathbf{h}| \downarrow & & \pi_m|\mathbf{h}| \downarrow & & \\ \Psi_m|\mathbf{T}'| & \xleftarrow{J'} & \Pi_m|\mathbf{T}'| & \xrightarrow{P'} & \pi_m|\mathbf{T}'| & \xrightarrow{r'} & W. \end{array}$$

By assertion a) of Lemma 2.2, $J \xrightarrow{1} \Psi_m|\mathbf{h}| \circ J = J' \circ \Pi_m|\mathbf{h}|$. By Claim 8.5, $J' \rightarrow P'$. Thus, $J' \rightarrow r' \circ P'$ by assertion a) of Lemma 2.2 and Lemma 2.3. Thus, by Lemma 2.4,

$$J' \circ \Pi_m|\mathbf{h}| \rightarrow r' \circ P' \circ \Pi_m|\mathbf{h}| = r' \circ \pi_m|\mathbf{h}| \circ P = r \circ P.$$

Therefore, $J \rightarrow r \circ P$ by Lemma 2.3. $\square$

§10. THE HUREWICZ INVARIANT

10.1. Lemma. *If $m \in \mathbb{N}$ and $\mathbf{T}$ is a simplicial pointed set, then*

$$J_{m,|\mathbf{T}|} \xrightarrow{1} \text{Hur}_{m,|\mathbf{T}|} \circ P_{m,|\mathbf{T}|}.$$

Proof. Put $\mathbf{K} = \mathbf{K}(H_m|\mathbf{T}|, m)$. By Lemma 7.1, there exists a simplicial bound map $\mathbf{f} : \mathbf{T} \rightarrow \mathbf{K}$ such that $H_m|\mathbf{f}|$ is the standard isomorphism. Consider the commutative diagram

$$\begin{array}{ccccccc} \Psi_m|\mathbf{T}| & \xleftarrow{J} & \Pi_m|\mathbf{T}| & \xrightarrow{P} & \pi_m|\mathbf{T}| & \xrightarrow{h} & H_m|\mathbf{T}| \\ \Psi_m|\mathbf{f}| \downarrow & & \Pi_m|\mathbf{f}| \downarrow & & \pi_m|\mathbf{f}| \downarrow & & H_m|\mathbf{f}| \downarrow \\ \Psi_m|\mathbf{K}| & \xleftarrow{J'} & \Pi_m|\mathbf{K}| & \xrightarrow{P'} & \pi_m|\mathbf{K}| & \xrightarrow{h'} & H_m|\mathbf{K}|, \end{array}$$

where $h = \text{Hur}_{m,|\mathbf{T}|}$ and $h' = \text{Hur}_{m,|\mathbf{K}|}$. By assertion a) of Lemma 2.2,

$$J \xrightarrow{1} \Psi_m|\mathbf{f}| \circ J = J' \circ \Pi_m|\mathbf{f}|.$$

By Lemma 5.1, $J' \xrightarrow{1} \text{id}_{\Pi_m|\mathbf{K}|}$. Thus, $J' \circ \Pi_m|\mathbf{f}| \xrightarrow{1} \Pi_m|\mathbf{f}|$ by Lemma 2.4. Now, Lemma 5.2 shows that P' is a homomorphism. Assertion a) of Lemma 2.2 implies the relation

$$\Pi_m|\mathbf{f}| \xrightarrow{1} h' \circ P' \circ \Pi_m|\mathbf{f}| = H_m|\mathbf{f}| \circ h \circ P.$$

Since $H_m|\mathbf{f}|$ is an isomorphism, $\Pi_m|\mathbf{f}| \xrightarrow{1} h \circ P$. Therefore, $J \xrightarrow{1} h \circ P$ by Lemma 2.3. $\square$

§11. r -POINT TRANSFORMATIONS

Definition. Suppose $r, m, n \in \mathbb{N}_0$, and X and Y are pointed spaces. A map $F : \Pi_m X \rightarrow \Pi_n Y$ is said to be r -point if for every point $z \in S^n$ there exists a set $T \subset S^m$ of at most r points such that for any $a, a' \in \Pi_m X$ the relation $a|_T = a'|_T$ implies $F(a)(z) = F(a')(z)$ (in other words, if the value of $F(a)$ at each point is determined by the values of a at some r points).

Our aim in this section is to prove Lemma 11.3.

Notation and a convention. Suppose $m \in \mathbb{N}_0$ and X is a pointed space. Put $\underline{\Psi}_m X = \text{Hom}(\langle \underline{S}^m \rangle, \langle \underline{X} \rangle)$. The map

$$\underline{J}_{m,X} : \Pi_m X \rightarrow \underline{\Psi}_m X, \quad a \mapsto \langle \underline{a} \rangle,$$

is also called the *main map* (and is denoted by $\underline{J}, \underline{J}'$, etc. if this does not cause ambiguity).

11.1. Claim. *Suppose $F : \Pi_m X \rightarrow \Pi_n Y$ is an r -point map. Then $\underline{J}_{m,X} \xrightarrow{r} \underline{J}_{m,Y} \circ F$.*

Proof. There are (possibly, discontinuous) maps

$$k_1, \dots, k_r : S^n \rightarrow S^m, \quad d_z : X^{\times r} \rightarrow Y, \quad z \in S^n,$$

such that

$$F(a)(z) = d_z(a(k_1(z)), \dots, a(k_r(z))), \quad z \in S^n, \quad a \in \Pi_m X.$$

Consider the usual isomorphism

$$i : \langle \underline{X} \rangle^{\otimes r} \rightarrow \langle \underline{X}^{\times r} \rangle, \quad \langle \underline{x}_1 \rangle \otimes \dots \otimes \langle \underline{x}_r \rangle \mapsto \langle \underline{(x_1, \dots, x_r)} \rangle.$$

We have homomorphisms $\langle d_z \rangle : \langle X^{\times r} \rangle \rightarrow \langle Y \rangle$, $z \in S^n$. We introduce the homomorphism

$$h : (\underline{\Psi}_m X)^{\otimes r} \rightarrow \underline{\Psi}_n Y, \\ h(w_1 \otimes \cdots \otimes w_r)(\underline{z}') := \langle d_z \rangle(i(w_1(\underline{k}_1(z)') \otimes \cdots \otimes w_r(\underline{k}_r(z)'))), \quad z \in S^n,$$

and consider the commutative diagram

$$\begin{array}{ccc} \Pi_m X & \xrightarrow{F} & \Pi_n Y \\ \underline{J} \downarrow & & \downarrow \underline{J}' \\ \underline{\Psi}_m X & \xrightarrow{R} (\underline{\Psi}_m X)^{\otimes r} \xrightarrow{h} & \underline{\Psi}_n Y, \end{array}$$

where $R(w) = w^{\otimes r}$, $w \in \underline{\Psi}_m X$. By Lemmas 2.8 and 2.4, $\underline{J} \xrightarrow{r} R \circ \underline{J}$. Assertion a) of Lemma 2.2 shows that

$$R \circ \underline{J} \xrightarrow{1} h \circ R \circ \underline{J} = \underline{J}' \circ F.$$

Therefore, $\underline{J} \xrightarrow{r} \underline{J}' \circ F$ by Lemma 2.3. $\square$

11.2. Claim. *If $m \in \mathbb{N}_0$ and X is a pointed space, then $\underline{J} = \underline{J}_{m,X} \xrightarrow{1} J_{m,X}$ and $J \xrightarrow{1} \underline{J}$.*

Proof. Consider the homomorphisms

$$p : \langle \underline{X} \rangle \rightarrow \langle X \rangle, \quad \underline{x}' \mapsto \langle x' \rangle, \quad x \in X,$$

and

$$h : \underline{\Psi}_m X \rightarrow \Psi_m X, \quad h(W)(\underline{z}') := p(W(\langle z' \rangle)), \quad z \in S^m \setminus \{*\}.$$

It is easy to check that $h \circ \underline{J} = J$. By assertion a) of Lemma 2.2, $\underline{J} \xrightarrow{1} J$.

If

$$K : \Pi_m X \rightarrow \mathbb{Z} \oplus \Psi_m X, \quad K(a) := (1, J(a)),$$

then $J \xrightarrow{1} K$ by Lemmas 2.8, 2.4, 2.1, and 2.6. We introduce the homomorphisms

$$s : \langle X \rangle \rightarrow \langle \underline{X} \rangle, \quad \langle x' \rangle \mapsto \langle \underline{x}' - \langle * \rangle \rangle, \quad x \in X,$$

and

$$f : \mathbb{Z} \oplus \Psi_m X \rightarrow \underline{\Psi}_m X, \quad f(t, w)(\underline{z}') := t \langle * \rangle + s(w(\langle z' \rangle)), \quad z \in S^m.$$

It is easy to check that $f \circ K = \underline{J}$. By assertion a) of Lemma 2.2, $K \xrightarrow{1} \underline{J}$. Therefore, $J \xrightarrow{1} \underline{J}$ by Lemma 2.3. $\square$

11.3. Lemma. *Under the assumptions of Claim 11.1, $J_{m,X} \xrightarrow{r} J_{m,Y} \circ F$.*

This follows from Claims 11.1, 11.2 and Lemmas 2.4, 2.3.

§12. COBAR CONSTRUCTION

The construction M^r and convolution. Suppose $r \in \mathbb{N}_0$, and X is a pointed space. Let

$$W := \bigcup_{s=0}^r \{(x_1, \dots, x_r) \in X^{\times r} : x_s = x_{s+1}\} \subset X^{\times r},$$

where $x_0 = x_{r+1} = *$. We put $M^r X = X^{\times r} / W$ (cf. [12]). This construction preserves the convenience of spaces.

We introduce the map

$$K : \Delta^r \times \Omega X \rightarrow X^{\times r}, \quad (z, u) \mapsto (u(z_1), \dots, u(z_r))$$

(as in iterated integrals; see [5]). It is easily seen that

$$K(\partial \Delta^r \times \Omega X \cup \Delta^r \times \{*\}) \subset W.$$

Consider the following continuous bound map:

$$\begin{aligned} k: S^r \Omega X &\rightarrow M^r X, & t^\circ u &\mapsto c(K(t^\Delta, u)) (= c(u(z_1), \dots, u(z_r))), \\ t &\in I^r, & u &\in \Omega X, & (z_1, \dots, z_r) &= t^\Delta \in \Delta^r, \end{aligned}$$

where $c: X^{\times r} \rightarrow M^r X$ is the projection. The map k is called *convolution*.

12.1. Lemma. *Suppose $r \in \mathbb{N}_0$ and X is a simply connected convenient pointed space. Then the convolution $k: S^r \Omega X \rightarrow M^r X$ is $(2r+1)$ -connected.*

The proof follows the lines of [6] (see §§16 and 17 below).

§13. APPLYING THE CARTAN–SERRE THEOREM

Definition. Suppose $r \in \mathbb{N}_0$, $q \in \mathbb{N}$, and X is a pointed space. Let $k: S^r \Omega X \rightarrow M^r X$ be the convolution. Consider the commutative diagram

$$\begin{array}{ccccccc} \Pi_{q+1} X & \xrightarrow{D} & \Pi_q \Omega X & \xrightarrow{Z^r} & \Pi_{q+r} S^r \Omega X & \xrightarrow{\Pi_{q+r} k} & \Pi_{q+r} M^r X \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ \pi_{q+1} X & \xrightarrow{d} & \pi_q \Omega X & \xrightarrow{z^r} & \pi_{q+r} S^r \Omega X & \xrightarrow{\pi_{q+r} k} & \pi_{q+r} M^r X, \end{array}$$

where the vertical arrows are the main maps. The *development transformation*

$$F: \Pi_{q+1} X \rightarrow \Pi_{q+r} M^r X$$

and the *development homomorphism*

$$f: \pi_{q+1} X \rightarrow \pi_{q+r} M^r X$$

are the compositions in the upper and the lower (respectively) lines of the diagram.

13.1. Claim. *The development transformation $F: \Pi_{q+1} X \rightarrow \Pi_{q+r} M^r X$ is r -point.*

Proof. Let $c: X^{\times r} \rightarrow M^r X$ be the projection. For $a \in \Pi_{q+1} X$, $s \in I^q$, and $t \in I^r$ we have

$$F(a)((t, s)^\circ) = c(a((z_1, s)^\circ), \dots, a((z_r, s)^\circ)),$$

where $(z_1, \dots, z_r) = t^\Delta \in \Delta^r$. □

13.2. Lemma. *Suppose $q \in \mathbb{N}$ and X is a pointed space. Then $\ker \text{Hur}_{q, \Omega X} = \text{Tors}$.*

This follows from the Cartan–Serre theorem; see [11, Appendix].

13.3. Claim. *Suppose $r \in \mathbb{N}_0$, $q \in \mathbb{N}$, and X is a simply connected convenient pointed space. Let $f: \pi_{q+1} X \rightarrow \pi_{q+r} M^r X$ be the development homomorphism. Suppose $r \geq q$. Then $\ker(\text{Hur}_{q+r, M^r X} \circ f) = \text{Tors}$.*

Proof. Let $k: S^r \Omega X \rightarrow M^r X$ be the convolution. Consider the commutative diagram

$$\begin{array}{ccccccc} \pi_{q+1} X & \xrightarrow{d} & \pi_q \Omega X & \xrightarrow{z^r} & \pi_{q+r} S^r \Omega X & \xrightarrow{\pi_{q+r} k} & \pi_{q+r} M^r X \\ & & h' \downarrow & & h'' \downarrow & & h \downarrow \\ & & H_q \Omega X & \xrightarrow{s^r} & H_{q+r} S^r \Omega X & \xrightarrow{H_{q+r} k} & H_{q+r} M^r X, \end{array}$$

where s^r is the suspension isomorphism and h , h' , and h'' are the Hurewicz homomorphisms. We have

$$h \circ f = h \circ \pi_{q+r} k \circ z^r \circ d = H_{q+r} k \circ s^r \circ h' \circ d.$$

By Lemma 12.1, $H_{q+r} k$ is an isomorphism. By Lemma 13.2, $\ker h' = \text{Tors}$. Therefore, $\ker h \circ f = \text{Tors}$. □

13.4. Claim. Suppose $m \in \mathbb{N}$, and X is a simply connected convenient pointed space. Let $q: \pi_m X \rightarrow \pi_m X / \text{Tors}$ be the projection. Then $J_{m,X} \xrightarrow{m-1} q \circ P$.

Proof. Put $r = m - 1$, $n = 2m - 2$ (we assume that $m > 1$). Consider the diagram

$$\begin{array}{ccccccc}
 \Psi_m X & \xleftarrow{J} & \Pi_m X & \xrightarrow{P} & \pi_m X & \xrightarrow{q} & \pi_m X / \text{Tors} \\
 & & F \downarrow & & f \downarrow & & \\
 \Psi_n M^r X & \xleftarrow{J'} & \Pi_n M^r X & \xrightarrow{P'} & \pi_n M^r X & & t \downarrow \\
 & & & & h \downarrow & & \\
 & & & & H_n M^r X & \xrightarrow{p} & H_n M^r X / \text{Tors},
 \end{array}$$

where t is a homomorphism such that $t \circ q = p \circ h \circ f$. This diagram is commutative. By Claim 13.1, F is an r -point transformation. Thus, $J \xrightarrow{r} J' \circ F$ by Lemma 11.3. By Lemma 10.1, $J' \xrightarrow{1} h \circ P'$. Therefore, $J' \circ F \xrightarrow{1} h \circ P' \circ F$ by Lemma 2.4. Assertion a) of Lemma 2.2 implies that

$$h \circ P' \circ F \xrightarrow{1} p \circ h \circ P' \circ F = t \circ q \circ P.$$

Since t is a monomorphism (by Claim 13.3), we have $t \circ q \circ P \xrightarrow{1} q \circ P$ by assertion b) of Lemma 2.2. Therefore, $J \xrightarrow{r} q \circ P$ by Lemma 2.3. $\square$

§14. COMPLETION OF THE PROOF

14.1. Claim. Suppose $m \in \mathbb{N}$, and X is a simply connected convenient pointed space. If the groups $\pi_q X$, $q \in \mathbb{N}$, are finitely generated, then $J_{m,X} \rightarrow P_{m,X}$.

Proof. There is an isomorphism

$$s = q \times \prod_{p \in T} r_p: \pi_m X \rightarrow \pi_m X / \text{Tors} \times \prod_{p \in T} W_p,$$

where $q: \pi_m X \rightarrow \pi_m X / \text{Tors}$ is the projection, T is the set of prime divisors of the order of the group $\text{Tors } \pi_m X$, and, for each $p \in T$, W_p is a p -special Abelian group and $r_p: \pi_m X \rightarrow W_p$ is a homomorphism. By Claim 13.4, $J \rightarrow q \circ P$. By Claim 9.2, $J \rightarrow r_p \circ P$ for each $p \in T$. By Lemmas 2.1 and 2.6, $J \rightarrow s \circ P$. Since s is an isomorphism, $J \rightarrow P$. $\square$

14.2. Claim. Suppose $m \in \mathbb{N}$, and X is a simply connected admissible pointed space. If the groups $\pi_q X$, $q \in \mathbb{N}$, are finitely generated, then $J_{m,X} \rightarrow P_{m,X}$.

Proof. We have a minimal fibrant simplicial pointed set $\mathbf{T}$ and a bound equivalence $h: X \rightarrow |\mathbf{T}|$ (see [10, §8]). Since $\mathbf{T}$ is a connected minimal fibrant simplicial set and the groups $\pi_q |\mathbf{T}|$, $q \in \mathbb{N}$, are countable, $\mathbf{T}$ is a simplicial countable set. Thus, $|\mathbf{T}|$ is a convenient pointed space. Consider the commutative diagram

$$\begin{array}{ccccc}
 \Psi_m X & \xleftarrow{J} & \Pi_m X & \xrightarrow{P} & \pi_m X \\
 \Psi_m h \downarrow & & \Pi_m h \downarrow & & \pi_m h \downarrow \\
 \Psi_m |\mathbf{T}| & \xleftarrow{J'} & \Pi_m |\mathbf{T}| & \xrightarrow{P'} & \pi_m |\mathbf{T}|.
 \end{array}$$

By assertion a) of Lemma 2.2,

$$J \xrightarrow{1} \Psi_m h \circ J = J' \circ \Pi_m h.$$

By Claim 14.1, $J' \twoheadrightarrow P'$. Thus, by Lemma 2.4,

$$J' \circ \Pi_m h \twoheadrightarrow P' \circ \Pi_m h = \pi_m h \circ P.$$

Therefore, $J \twoheadrightarrow \pi_m h \circ P$ by Lemma 2.3. Since $\pi_m h$ is an isomorphism, $J \twoheadrightarrow P$. $\square$

14.3. Claim. Suppose $r, m \in \mathbb{N}_0$, X is a pointed space, V is an Abelian group, and $F : \Pi_m X \rightarrow V$ is a bound map. Let $Q \subset (\Psi_m X)^{\otimes r}$ be the subgroup generated by the elements $\langle a \rangle^{\otimes r}$, $a \in \Pi_m X$. Suppose $J = J_{m,X} \xrightarrow{r} F$. Then there exists a homomorphism $l : Q \rightarrow V$ such that $l(\langle a \rangle^{\otimes r}) = F(a)$ for any $a \in \Pi_m X$.

Proof. For each $t \in \mathbb{N}$, consider the homomorphisms

$$b_t : \langle X \rangle^{\otimes t} \rightarrow \langle X \rangle, \quad 'x_1' \otimes \cdots \otimes 'x_t' \mapsto \begin{cases} 'x_1' & \text{if } x_1 = \cdots = x_t, \\ 0 & \text{otherwise,} \end{cases}$$

and

$$B_t : (\Psi_m X)^{\otimes t} \rightarrow \Psi_m X, \\ B_t(w_1 \otimes \cdots \otimes w_t)('z') = b_t(w_1('z') \otimes \cdots \otimes w_t('z')), \quad z \in S^m.$$

For $t \in \mathbb{N}$ and $a \in \Pi_m X$, we have $B_t(\langle a \rangle^{\otimes t}) = \langle a \rangle$, because

$$B_t(\langle a \rangle^{\otimes t})('z') = b_t(\langle a \rangle('z')^{\otimes t}) = b_t('a(z)'^{\otimes t}) = 'a(z)' = \langle a \rangle('z')$$

for $z \in S^m$. For each $s = 1, \dots, r$, we introduce the homomorphism

$$G_s : (\Psi_m X)^{\otimes r} \rightarrow (\Psi_m X)^{\otimes s}, \\ w_1 \otimes \cdots \otimes w_r \mapsto w_1 \otimes \cdots \otimes w_{s-1} \otimes B_{r-s+1}(w_s \otimes \cdots \otimes w_r).$$

For $a \in \Pi_m X$, we have

$$G_s(\langle a \rangle^{\otimes r}) = \langle a \rangle^{\otimes(s-1)} \otimes B_{r-s+1}(\langle a \rangle^{\otimes(r-s+1)}) = \langle a \rangle^{\otimes(s-1)} \otimes \langle a \rangle = \langle a \rangle^{\otimes s}.$$

Let

$$P \subset \bigoplus_{s=1}^r (\Psi_m X)^{\otimes s}$$

be the subgroup generated by the elements $(\langle a \rangle^{\otimes s})_{s=1}^r$, $a \in \Pi_m X$. Since $\text{Tors } \Psi_m X = 0$ and $J \xrightarrow{r} F$, Corollary 2.11 implies the existence of a homomorphism $k : P \rightarrow V$ such that $k((\langle a \rangle^{\otimes s})_{s=1}^r) = F(a)$ for any $a \in \Pi_m X$.

If $z \in Q$, then $(G_s(z))_{s=1}^r \in P$ because $(G_s(\langle a \rangle^{\otimes r}))_{s=1}^r = (\langle a \rangle^{\otimes s})_{s=1}^r \in P$ for $a \in \Pi_m X$. Put $l(z) = k((G_s(z))_{s=1}^r)$, $z \in Q$. For $a \in \Pi_m X$, we have

$$l(\langle a \rangle^{\otimes r}) = k((G_s(\langle a \rangle^{\otimes r}))_{s=1}^r) = k((\langle a \rangle^{\otimes s})_{s=1}^r) = F(a).$$

$\square$

14.4. Theorem 1: the proof itself. By Claim 14.2, $J_{m,X} \twoheadrightarrow P_{m,X}$. By Lemma 2.1, for any sufficiently large $r \in \mathbb{N}_0$ we have $J_{m,X} \xrightarrow{r} P_{m,X}$. Applying Claim 14.3 concludes the proof.

§15. PROOF OF LEMMA 9.1

15.1. Lemma. Suppose $m \in \mathbb{N}$, U and V are finite Abelian groups, and $e : U \rightarrow V$ is a homomorphism. If $mU = 0$ and $e/d : U/d \rightarrow V/d$ is a monomorphism for every divisor $d \in \mathbb{N}$ of m , then there exists a homomorphism $h : V \rightarrow U$ such that $h \circ e = \text{id}_U$.

Proof. The homomorphism $e (= e/m)$ is a monomorphism. Take an arbitrary $q \in \mathbb{N}$. By [4, Corollary 28.3], it suffices to show that e/q is a monomorphism. Put $d = \text{G.C.D.}(q, m)$. Consider the commutative diagram

$$\begin{array}{ccc} U/q & \xrightarrow{e/q} & V/q \\ p \downarrow & & p' \downarrow \\ U/d & \xrightarrow{e/d} & V/d, \end{array}$$

where p and p' are the homomorphisms of “reduction modulo d ”. It is easily seen that p is an isomorphism. By assumption, e/d is a monomorphism. Thus, e/q is a monomorphism. $\square$

Systems. Put $\sigma = \{1, 2, \dots, \infty\}$. A *system* of objects and morphisms of a category is a collection

$$(A_s, f_s^t)$$

of objects A_s , $s \in \sigma$, and morphisms

$$f_s^t : A_t \rightarrow A_s, \quad s, t \in \sigma, \quad s \leq t,$$

such that

$$f_s^s = \text{id}, \quad s \in \sigma, \quad \text{and} \quad f_r^s \circ f_s^t = f_r^t, \quad r, s, t \in \sigma, \quad r \leq s \leq t.$$

A system (V_s, l_s^t) of Abelian groups and homomorphisms is *regular* if V_∞ is the projective limit of the groups V_s , $s < \infty$ (more precisely, if for any sequence $(v_s \in V_s)_{s < \infty}$ such that $l_s^t(v_t) = v_s$, $s \leq t < \infty$, there exists a unique element $v_\infty \in V_\infty$ such that $l_s^\infty(v_\infty) = v_s$ for every $s < \infty$).

15.2. Lemma. *Suppose $q \in \mathbb{N}$, and (V_s, l_s^t) is a regular system of Abelian groups and homomorphisms. Suppose the groups V_s , $s < \infty$, are finite. Then the system $(V_s/q, l_s^t/q)$ is also regular.*

This is easy to check by using the fact that the projective limit of a sequence of nonempty finite sets is nonempty.

15.3. Lemma. *Suppose (V_s, l_s^t) is a regular system of finite Abelian groups and homomorphisms. Then for any sufficiently large $s < \infty$ there exists a homomorphism $h : V_s \rightarrow V_\infty$ such that $h \circ l_s^\infty = \text{id}$.*

Proof. For any $q \in \mathbb{N}$, the system $(V_s/q, l_s^t/q)$ is regular (by Lemma 15.2), and consequently l_s^∞/q is a monomorphism for all sufficiently large $s < \infty$ (because V_∞/q is finite). If $s < \infty$ is sufficiently large, then l_s^∞/d is a monomorphism for all divisors $d \in \mathbb{N}$ of the order of V_∞ , and Lemma 15.1 gives the required homomorphism. $\square$

Definition. Suppose $p \in \mathcal{P}$, and U, V are Abelian groups. Let $\hat{U}$ be the p -completion ($= p$ -profinite completion) of U , and let $c : U \rightarrow \hat{U}$ be the canonical homomorphism. A homomorphism $k : U \rightarrow V$ is said to be *p -completing* if there exists an isomorphism $i : \hat{U} \rightarrow V$ such that $i \circ c = k$.

15.4. Claim. *Suppose $p \in \mathcal{P}$, U is a finitely generated Abelian group, (V_s, l_s^t) is a regular system of Abelian groups and homomorphisms, the groups V_s , $s < \infty$, are p -special, $k : U \rightarrow V_\infty$ is a p -completing homomorphism, W is a p -special Abelian group, and $r : U \rightarrow W$ is a homomorphism. Then there exists $s < \infty$ and a homomorphism $g : V_s \rightarrow W$ such that $g \circ l_s^\infty \circ k = r$.*

Proof. Let q be a power of p such that $qW = 0$. By Lemma 15.2, the system $(V_s/q, l_s^t/q)$ is regular. Since V_∞ is isomorphic to the p -completion of a finitely generated Abelian group, V_∞/q is finite (see [7, Chapter VI, 5.2]). By Lemma 15.3, there exist $s < \infty$ and a homomorphism $h: V_s/q \rightarrow V_\infty/q$ such that $h \circ (l_s^\infty/q) = \text{id}$. Since k is p -completing, there exists a homomorphism $G: V_\infty \rightarrow W$ such that $G \circ k = r$. Since $qW = 0$, there exists a homomorphism $G': V_\infty/q \rightarrow W$ such that $G'(X|_q) = G(X)$ for any $X \in V_\infty$. Put $g' = G' \circ h: V_s/q \rightarrow W$. We define the required homomorphism g by the formula $g(x) = g'(x|_q)$. For $u \in U$, we have

$$\begin{aligned} g(l_s^\infty(k(u))) &= g'(l_s^\infty(k(u))|_q) = G'(h(l_s^\infty(k(u))|_q)) \\ &= G'(h((l_s^\infty/q)(k(u)|_q))) = G'(k(u)|_q) = G(k(u)) = r(u). \end{aligned}$$

□

15.5. Claim. Suppose $p \in \mathcal{P}$, $m \in \mathbb{N}$, $\mathbf{T}$ is a simply connected simplicial finite pointed set, W is a p -special Abelian group, and $r: \pi_m|\mathbf{T}| \rightarrow W$ is a homomorphism. Then there exists a simply connected finite pointed set $\mathbf{T}'$, a homomorphism $r': \pi_m|\mathbf{T}'| \rightarrow W$, and a simplicial bound map $\mathbf{h}: \mathbf{T} \rightarrow \mathbf{T}'$ such that $r' \circ \pi_m|\mathbf{h}| = r$ and the groups $\pi_q|\mathbf{T}'|$, $q \in \mathbb{N}$, are p -special.

Proof. We put $R = \mathbb{Z}_p$ and consider the system $(R_s\mathbf{T}, \mathbf{f}_s^t)$ of simplicial pointed sets and simplicial bound maps (see [7, Chapter I, §4]). By construction, for $s < \infty$ the $R_s\mathbf{T}$ are simplicial finite sets. By [7, Chapter I, 6.2 (i)], they are simply connected. Thus, the groups $\pi_q|R_s\mathbf{T}|$, $q \in \mathbb{N}$, are finitely generated by the Serre theorem. By [7, Chapter III, 5.6], they are R -nilpotent. Therefore, they are p -special. Consider the system $(\pi_m|R_s\mathbf{T}|, \pi_m|\mathbf{f}_s^t|)$ of Abelian groups and homomorphisms. Since the groups $\pi_{m+1}|R_s\mathbf{T}|$, $s < \infty$, are finite, the system is regular by [7, Chapter I, 4.3]. Let $\mathbf{c}: \mathbf{T} \rightarrow R_\infty\mathbf{T}$ be the canonical simplicial bound map (see [7, Chapter I, §4]). Since $\mathbf{T}$ is simply connected and the groups $\pi_q|\mathbf{T}|$, $q \in \mathbb{N}$, are finitely generated (by the Serre theorem), $\pi_m|\mathbf{c}|$ is p -completing (this is implied by [7, Chapter VI, §5]). By Claim 15.4, there exist $s < \infty$ and a homomorphism $g: \pi_m|R_s\mathbf{T}| \rightarrow W$ such that $g \circ \pi_m|\mathbf{f}_s^\infty| \circ \pi_m|\mathbf{c}| = r$. It remains to put $\mathbf{T}' = R_s\mathbf{T}$, $r' = g$, and $\mathbf{h} = \mathbf{f}_s^\infty \circ \mathbf{c}$. □

15.6. Lemma 9.1: the proof itself. Since the simplicial set $\mathbf{T}$ is simply connected and the groups $H_q|\mathbf{T}|$, $q \in \mathbb{N}$, are finitely generated (by the Serre theorem), there exists a simplicial finite pointed set $\tilde{\mathbf{T}}$ and an $(m+1)$ -connected simplicial map $\mathbf{f}: \tilde{\mathbf{T}} \rightarrow \mathbf{T}$ (it is not difficult to construct them by induction on m , applying the relative Hurewicz theorem at each step; cf. [9, Proposition 4C.1]). Put

$$\tilde{r} = r \circ (\pi_m|\mathbf{f}|)^{-1}: \pi_m|\tilde{\mathbf{T}}| \rightarrow W.$$

By Claim 15.5, there exists a simply connected simplicial pointed set $\tilde{\mathbf{T}}'$, a homomorphism $\tilde{r}': \pi_m|\tilde{\mathbf{T}}'| \rightarrow W$, and a simplicial bound map $\tilde{\mathbf{h}}: \tilde{\mathbf{T}} \rightarrow \tilde{\mathbf{T}}'$ such that $\tilde{r}' \circ \pi_m|\tilde{\mathbf{h}}| = \tilde{r}$ and the groups $\pi_q|\tilde{\mathbf{T}}'|$, $q \in \mathbb{N}$, are p -special. We have a minimal fibrant simplicial pointed set $\mathbf{T}'$ with $\pi_q|\mathbf{T}'| = 0$ for all $q > m$ and an $(m+1)$ -connected simplicial bound map $\mathbf{f}': \tilde{\mathbf{T}}' \rightarrow \mathbf{T}'$ (see [10, §§8, 9]). Put

$$r' = \tilde{r}' \circ (\pi_m|\mathbf{f}'|)^{-1}: \pi_m|\mathbf{T}'| \rightarrow W.$$

Since the simplicial bound map $\mathbf{f}$ is $(m+1)$ -connected, $\pi_q|\mathbf{T}'| = 0$ for all $q > m$, and $\mathbf{T}'$ is fibrant, it follows that there exists a simplicial bound map $\mathbf{h}: \mathbf{T} \rightarrow \mathbf{T}'$ such that the simplicial bound maps $\mathbf{h} \circ \mathbf{f}, \mathbf{f}' \circ \tilde{\mathbf{h}}: \tilde{\mathbf{T}} \rightarrow \mathbf{T}'$ are homotopic (“obstruction theory”). It is easy to check that $r' \circ \pi_m|\mathbf{h}| = r$. $\mathbf{T}'$ is a simplicial finite set because $\mathbf{T}'$ is a connected minimal fibrant simplicial set and the groups $\pi_q|\mathbf{T}'|$, $q \in \mathbb{N}$, are finite.

§16. PROOF OF LEMMA 12.1: AUXILIARY LEMMAS

16.0. Fiberwise contraction. Suppose B is a space, (E, E') is a topological pair, $p: E \rightarrow B$ is a continuous map, and $p': E' \rightarrow B$ is the restriction of p .

Let E'' be the space obtained from $E \sqcup B$ by identifying each point $X \in E'$ with $p'(X)$. Let $p'': E'' \rightarrow B$ be covered by $p \sqcup \text{id}: E \sqcup B \rightarrow B$. We put $(E, p)/(E', p') = (E'', p'')$.

16.1. Lemma. Suppose B is a Hausdorff space, (E_0, E_1) is a closed Borsuk pair, $p_0: E_0 \rightarrow B$ and $p_1: E_1 \rightarrow B$ are Hurewicz fibrations, and p_1 is the restriction of p_0 . Put $(E_2, p_2) = (E_0, p_0)/(E_1, p_1)$. Then p_2 is a Serre fibration.

Proof. Let $i: E_1 \rightarrow E_0$ be the inclusion, and let $c: E_0 \rightarrow E_2$ be the projection. Consider the map

$$f: \Gamma B \rightarrow B, \quad u \mapsto u(0),$$

which is a Hurewicz fibration. Putting

$$Q_k = \{(X, u) \in E_k \times \Gamma B : p_k(X) = f(u)\}, \quad k = 0, 1, 2,$$

we have $Q_1 \subset Q_0$. We introduce the map

$$d: Q_0 \rightarrow Q_2, \quad (X, u) \mapsto (c(X), u),$$

and, for $k = 0, 1, 2$, the map

$$h_k: \Gamma E_k \rightarrow Q_k, \quad U \mapsto (U(0), p_k \circ U).$$

We have a commutative diagram

$$\begin{array}{ccccc} \Gamma E_1 & \xrightarrow{\Gamma i} & \Gamma E_0 & \xrightarrow{\Gamma c} & \Gamma E_2 \\ h_1 \downarrow & & h_0 \downarrow & & h_2 \downarrow \\ Q_1 & \xrightarrow{j} & Q_0 & \xrightarrow{d} & Q_2, \end{array}$$

where j is an inclusion. Let

$$g: Q_0 \rightarrow E_0, \quad (X, u) \mapsto X.$$

(Q_0, Q_1) is a closed Borsuk pair by [3, Lecture 2, Proposition 5], because (E_0, E_1) is a closed Borsuk pair, g is a Hurewicz fibration (induced by the fibration f by means of p_0), and $Q_1 = g^{-1}(E_1)$. Since p_1 is a Hurewicz fibration, there exists a continuous map $s_1: Q_1 \rightarrow \Gamma E_1$ such that $h_1 \circ s_1 = \text{id}$. Applying the covering homotopy extension theorem (see [3, Lecture 2, Theorem 2]) to the pair (Q_0, Q_1) and the fibration p_0 , we get a continuous map $s_0: Q_0 \rightarrow \Gamma E_0$ such that $h_0 \circ s_0 = \text{id}$ and $s_0 \circ j = \Gamma i \circ s_1$. Obviously (?), there exists a unique map $s_2: Q_2 \rightarrow \Gamma E_2$ such that $s_2 \circ d = \Gamma c \circ s_0$. It is not difficult to check that s_2 is weakly continuous. Clearly, $h_2 \circ s_2 = \text{id}$. This implies that p_2 is a Serre fibration. $\square$

16.2. Lemma. Suppose X is a convenient space. Let $D \subset X^{\times 2}$ be the diagonal, let

$$A = X^{\times 2} \times \{0\} \cup D \times I \subset X^{\times 2} \times I,$$

and let $p: X^{\times 2} \times I \rightarrow X$ be the first projection. Then there exists a retraction $R: X^{\times 2} \times I \rightarrow A$ such that $p|_A \circ R = p$.

Proof. By the Borsuk theorem, there exists a retraction $r: X^{\times 2} \times I \rightarrow A$. Let

$$f, g: X^{\times 2} \times I \rightarrow X, \quad k: X^{\times 2} \times I \rightarrow I$$

be the maps for which $r(Z) = (f(Z), g(Z), k(Z))$, $Z \in X^{\times 2} \times I$. We construct continuous maps

$$G: X^{\times 2} \times I \rightarrow X \quad \text{and} \quad K: X^{\times 2} \times I \rightarrow I.$$

For $Z = (x, y, t) \in X^{\times 2} \times I$, let

$$G(Z) = \begin{cases} g(x, y, 3k(Z)) & \text{if } 3k(Z) \leq t, \\ f(x, y, 2t - 3k(Z)) & \text{if } t \leq 3k(Z) \leq 2t \text{ and } f(Z) = g(Z), \\ x & \text{if } 3k(Z) \geq 2t \text{ and } f(Z) = g(Z), \end{cases}$$

$$K(Z) = m(3k(Z) - 2t),$$

where $m : \mathbb{R} \rightarrow I$ is the increasing retraction. We put $R(Z) = (p(Z), G(Z), K(Z))$, $Z \in X^{\times 2} \times I$. $\square$

16.3. Lemma. *Suppose $n \in \mathbb{N}$, (B, A) is an n -connected convenient pointed pair of simply connected spaces, F is a simply connected convenient pointed space, and $g : B \rightarrow F$ is a convenient bound map. Let $G \subset B \times F$ be the graph of g . Then the pair $(B \times F, (A \times F) \cup G)$ is $(n + 2)$ -connected.*

Proof. All the spaces considered below are simply connected. Therefore, all the homotopy sets (including the relative ones) are Abelian groups. We take an arbitrary $q \in \mathbb{N}$ and put $F' = \{*\} \times F \subset B \times F$. Let

$$k : F' \rightarrow (B \times F, G), \quad j : F' \rightarrow (A \times F, A \times F \cap G)$$

be the inclusions.

We show that $\pi_q k$ and $\pi_q j$ are isomorphisms. Let $p : B \times F \rightarrow B$ be the projection. Then $p|_G$ is a homeomorphism and $(p|_G)^{-1} \circ p : B \times F \rightarrow G$ is a retraction. Consider the commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \pi_q G & \longrightarrow & \pi_q(B \times F) & \longrightarrow & \pi_q(B \times F, G) \longrightarrow 0 \\ & & \pi_q(p|_G) \downarrow & & \parallel & & \pi_q k \uparrow \\ 0 & \longleftarrow & \pi_q B & \xleftarrow{\pi_q p} & \pi_q(B \times F) & \longleftarrow & \pi_q F' \longleftarrow 0 \end{array}$$

where the unlabeled arrows are induced by inclusions. The rows are exact. Since $\pi_q(p|_G)$ is an isomorphism, so is $\pi_q k$. Similarly, $\pi_q j$ is an isomorphism.

Consider the commutative diagram

$$\begin{array}{ccccc} \pi_q F' & & \xrightarrow{\text{id}} & & \pi_q F' \\ \pi_q j \downarrow & & & & \pi_q k \downarrow \\ \pi_q(A \times F, (A \times F) \cap G) & \xrightarrow{\pi_q e} & \pi_q((A \times F) \cup G, G) & \xrightarrow{\pi_q i} & \pi_q(B \times F, G), \end{array}$$

where e and i are inclusions. The pair $(A \times F, (A \times F) \cap G)$ is simply connected. The pair $(G, (A \times F) \cap G)$ is homeomorphic to the pair (B, A) and, consequently, is n -connected. By the homotopy excision theorem, $\pi_q e$ is an epimorphism if $q \leq n + 1$. By the above diagram, $\pi_q i$ is an epimorphism for any q and an isomorphism if $q \leq n + 1$. Comparing the homotopy sequences of the pairs $(A \times F \cup G, G)$ and $(B \times F, G)$, we see that the pair $(B \times F, A \times F \cup G)$ is $(n + 2)$ -connected. $\square$

§17. THE PROOF ITSELF OF LEMMA 12.1

Let $V_0 = \Delta^r \times X^{\times(r+1)}$, and let $f_0 : V_0 \rightarrow X$ be the last projection. Put

$$V_1 = \bigcup_{s=0}^r \{((z_1, \dots, z_r), x_1, \dots, x_{r+1}) \in V_0 : z_s = z_{s+1}, x_s = x_{s+1}\} \subset V_0,$$

where $z_0 = 0$, $z_{r+1} = 1$, and $x_0 = *$. We denote

$$f_1 := f_0| : V_1 \rightarrow X.$$

Below we show that f_1 is a Hurewicz fibration. Put $(V, f) = (V_0, f_0)/(V_1, f_1)$. By Lemma 16.1, f is a Serre fibration. Let

$$V_0^* = f_0^{-1}(*), \quad V_1^* = f_1^{-1}(*), \quad V^* = V_0^*/V_1^*,$$

and let $i: V^* \rightarrow V$ be the embedding covered by the inclusion $V_0^* \rightarrow V_0$.

We put

$$P = \{u \in \Gamma X : u(0) = *\}, \quad W_0 = \Delta^r \times P,$$

and introduce the map

$$g_0: W_0 \rightarrow X, \quad (z, u) \mapsto u(1).$$

If

$$W_1 = \partial \Delta^r \times P \subset W_0, \quad g_1 := g_0|: W_1 \rightarrow X,$$

then, clearly, g_0 and g_1 are Hurewicz fibrations. Put $(W, g) = (W_0, g_0)/(W_1, g_1)$. By Lemma 16.1, g is a Serre fibration. Let $W_0^* = g_0^{-1}(*)$ and $W_1^* = g_1^{-1}(*)$, and let $j: W^* \rightarrow W$ be the embedding covered by the inclusion $W_0^* \rightarrow W_0$.

For the map

$$h_0: W_0 \rightarrow V_0, \quad h_0(z, u) := (z, u(z_1), \dots, u(z_r), u(1)), \\ z = (z_1, \dots, z_r) \in \Delta^r, \quad u \in P,$$

we have $f_0 \circ h_0 = g_0$ and $h_0(W_1) \subset V_1$. Next, let $h: W \rightarrow V$ be the map covered by h_0 , and let $h_0^* := h_0|: W_0^* \rightarrow V_0^*$. Next, let $h^*: W^* \rightarrow V^*$ be the map covered by h_0^* .

We put

$$K = \Delta^r \times \{*\} \subset V_0, \quad \tilde{V} = V_0/(V_1 \cup K), \quad \tilde{V}^* = V_0^*/(V_1^* \cup K).$$

Let $c: V \rightarrow \tilde{V}$ and $c^*: V^* \rightarrow \tilde{V}^*$ be the maps covered by $\text{id}: V_0 \rightarrow V_0$ and $\text{id}: V_0^* \rightarrow V_0^*$ (respectively).

If

$$L = \Delta^r \times \{*\} \subset W_0, \quad \tilde{W} = W_0/(W_1 \cup L), \quad \tilde{W}^* = W_0^*/(W_1^* \cup L),$$

then $\tilde{W}$ is homeomorphic to $S^r P$ and, consequently, contractible. Let $d: W \rightarrow \tilde{W}$ and $d^*: W^* \rightarrow \tilde{W}^*$ be the maps covered by $\text{id}: W_0 \rightarrow W_0$ and $\text{id}: W_0^* \rightarrow W_0^*$ (respectively).

We have $h_0(W_1 \cup L) \subset V_1 \cup K$. Let $\tilde{h}: \tilde{W} \rightarrow \tilde{V}$ be the map covered by h_0 . We have $h_0^*(W_1^* \cup L) \subset V_1^* \cup K$. Let $\tilde{h}^*: \tilde{W}^* \rightarrow \tilde{V}^*$ be the map covered by h_0^* .

We put $Y_0 = X^{\times(r+1)}$,

$$Y_1 = \bigcup_{s=0}^r \{(x_1, \dots, x_{r+1}) \in Y_0 : x_s = x_{s+1}\} \subset Y_0,$$

where $x_0 = *$. Let $Z = Y_0/Y_1$, and let $p_0: V_0 \rightarrow Y_0$ be the projection. Clearly, p_0 is an equivalence. Put $p_1 := p_0|: V_1 \cup K \rightarrow Y_1$. The preimage of each point under the map p_1 is contractible, because it is either the simplex Δ^r , or the union of at most r $(r-1)$ -dimensional faces of that simplex. Therefore, p_1 is also an equivalence.

Let $q: \tilde{V} \rightarrow Z$ be the map covered by p_0 . We have a commutative diagram

$$\begin{array}{ccccc} V_1 \cup K & \longrightarrow & V_0 & \longrightarrow & \tilde{V} \\ p_1 \downarrow & & p_0 \downarrow & & q \downarrow \\ Y_1 & \longrightarrow & Y_0 & \longrightarrow & Z \end{array}$$

with cofibration rows. Since p_0 and p_1 are equivalences, so is q . Put

$$Y_0^* = X^{\times r} \times \{*\} \subset Y_0, \quad Y_1^* = Y_0^* \cap Y_1, \quad Z^* = Y_0^*/Y_1^*, \\ p_0^* := p_0|: V_0^* \rightarrow Y_0^*, \quad p_1^* := p_0^*|: V_1^* \rightarrow Y_1^*,$$

and let $q^* : \tilde{V}^* \rightarrow Z^*$ be the map covered by p_0^* . Like p_0 , p_1 , and q , the maps p_0^* , p_1^* , and q^* are equivalences.

Let $l = 2r + 1$. Using Lemma 16.3 and induction on r , we see that the pair (Y_0, Y_1) is l -connected. Therefore, Z is l -connected. Consequently, $\tilde{V}$ is l -connected. Since $\tilde{W}$ is contractible, $\tilde{h}$ is l -connected. We have the commutative diagram

$$\begin{array}{ccccc} S^r \vee X & \longrightarrow & W & \xrightarrow{d} & \tilde{W} \\ \text{id} \downarrow & & h \downarrow & & \tilde{h} \downarrow \\ S^r \vee X & \longrightarrow & V & \xrightarrow{c} & \tilde{V} \end{array}$$

with cofibration rows. Thus, h is l -connected (because V and W are simply connected). We have the commutative diagram

$$\begin{array}{ccccc} W^* & \xrightarrow{j} & W & \xrightarrow{g} & X \\ h^* \downarrow & & h \downarrow & & \text{id} \downarrow \\ V^* & \xrightarrow{i} & V & \xrightarrow{f} & X \end{array}$$

with fibration rows. Thus, h^* is l -connected. We have the commutative diagram

$$\begin{array}{ccccc} S^r & \longrightarrow & W^* & \xrightarrow{d^*} & \tilde{W}^* \\ \text{id} \downarrow & & h^* \downarrow & & \tilde{h}^* \downarrow \\ S^r & \longrightarrow & V^* & \xrightarrow{c^*} & \tilde{V}^* \end{array}$$

with cofibration rows. Thus, $\tilde{h}^*$ is l -connected.

Consider the map

$$E : I^r \times \Omega X \rightarrow W_0^*, \quad (t, u) \mapsto (t^\Delta, u).$$

Let $e : S^r \Omega X \rightarrow \tilde{W}^*$ be the map covered by E . It is easily seen that e is a homeomorphism. We have a commutative diagram

$$\begin{array}{ccccc} S^r \Omega X & & \xrightarrow{k} & & M^r X \\ e \downarrow & & & & \downarrow \\ \tilde{W}^* & \xrightarrow{\tilde{h}^*} & \tilde{V}^* & \xrightarrow{q^*} & Z^*, \end{array}$$

where the second vertical arrow is the evident homeomorphism. Since q^* is an equivalence, k is l -connected.

Why is f_1 a Hurewicz fibration? Let $D \subset X^{\times 2}$ be the diagonal, let

$$A = X^{\times 2} \times \{0\} \cup D \times I \subset X^{\times 2} \times I,$$

and let $p : X^{\times 2} \times I \rightarrow X$ be the first projection. By Lemma 16.2, there exists a retraction $R : X^{\times 2} \times I \rightarrow A$ such that $p|_A \circ R = p$. For $x \in X$, we put

$$A_x := X \times \{0\} \cup \{x\} \times I \subset X \times I$$

and introduce the retraction

$$R_x : X \times I \rightarrow A_x$$

defined by the condition

$$R(x, y, t) = (x, R_x(y, t)), \quad y \in X, \quad t \in I.$$

Given any point $B = (z^0, x_1^0, \dots, x_{r+1}^0) \in V_1$, where $z^0 = (z_1^0, \dots, z_r^0) \in \Delta^r$, we put $b = f_1(B) = x_{r+1}^0$. Suppose $u \in \Gamma X$ is a path with $u(0) = b$. We construct a path $U \in \Gamma V_1$ such that $U(0) = B$ and $f_1 \circ U = u$. We define a map $g : A_b \rightarrow X$ by putting

$g(y, 0) = y$ for $y \in X$ and $g(b, t) = u(t)$ for $t \in I$. Let $h = g \circ R_b: X \times I \rightarrow X$. For $t \in I$, put $U(t) = (z^0, x_1, \dots, x_{r+1})$, where $x_s = h(x_s^0, tz_s^0)$, $s = 1, \dots, r+1$, and $z_{r+1}^0 = 1$. The path U depends on b and u continuously.

Acknowledgements. The statement of the problem was taken from a conversation with M. N. Gusarov; the proof roughly follows an argument in his manuscript “Axiomatic theory of cubic spaces”. It was a pleasure to discuss various questions with N. E. Mnëv, N. Yu. Netsvetaev, I. A. Panin, O. Ya. Viro, and M. Yu. Zvagel’skiĭ.
