A GENERAL CLASS OF LINEAR TRANSFORMATIONS OF WIENER INTEGRALS^(1,2)

BY
D. A. WOODWARD

Introduction. Let C be the space of continuous functions $x(t)$, $0 \leq t \leq 1$, where $x(0) = 0$. We consider one to one linear transformations of C onto C of the form

$$(0.1) \quad y(t) = x(t) + \int_0^1 L(t, s) dx(s).$$

N. Wiener [4] has given an integral on C . We obtain the transformation formula for this integral under transformations of type (0.1). The transformations of type (0.1) which we consider contain as a special case the transformations considered by Cameron and Martin [1].

Let I be the interval $[0, 1]$ and I^2 the square $I \otimes I$. If $x \in C$, we define

$$|||x||| = \max_{t \in I} |x(t)|.$$

If $K(t, s)$ is bounded and measurable on I^2 and $K(t, t)$ is measurable on I , we denote the Fredholm determinant of $K(t, s)$ evaluated at $\lambda = -1$ by

$$(0.2) \quad D(K) = 1 + \sum_{n=1}^{\infty} \frac{1}{n!} \int_0^1 \cdots \int_0^1 \begin{vmatrix} K(s_1, s_1) & \cdots & K(s_1, s_n) \\ \vdots & & \vdots \\ K(s_n, s_1) & \cdots & K(s_n, s_n) \end{vmatrix} ds_1 \cdots ds_n.$$

We say that $M(t, s)$ is of bounded variation (B.V.) on I^2 if there exists $(t_0, s_0) \in I^2$ such that $M(t_0, s)$ and $M(t, s_0)$ are of B.V. on I and

$$\text{var}_{(t,s) \in I^2} M(t, s) < \infty.$$

Here

$$(0.3) \quad \begin{aligned} & \text{var}_{(t,s) \in I^2} M(t, s) \\ &= \sup \sum_{j=1}^m \sum_{i=1}^n |M(t_i, s_j) - M(t_i, s_{j-1}) + M(t_{i-1}, s_{j-1}) - M(t_{i-1}, s_j)|, \end{aligned}$$

Presented to the Society, April 22, 1960; received by the editors January 18, 1960.

² The author wishes to thank Professor R. H. Cameron for help in this investigation.

where the supremum is taken over all partitions $0 \leq t_0 \leq \dots \leq t_n \leq 1$ and $0 \leq s_0 \leq \dots \leq s_m \leq 1$ of I . The following theorem is the main result of this paper.

THEOREM A. Let $L(t, s)$ satisfy the following conditions

$$(0.4) \quad L(0, s) = 0, \quad s \in I.$$

(0.5) $L(t, s)$ is absolutely continuous in t on I for each $s \in I$ and there exist $M(t, s)$ and $J(t)$ such that

$$(0.6) \quad \frac{\partial}{\partial t} L(t, s) = \overline{M}(t, s)$$

for almost all t on I for all $s \in I$, where

$$(0.7) \quad \overline{M}(t, s) = \begin{cases} M(t, s), & 0 \leq t < s \leq 1, \\ M(t, s) + \frac{1}{2} J(t), & 0 \leq t = s \leq 1, \\ M(t, s) + J(t), & 0 \leq s < t \leq 1, \end{cases}$$

and where

$$(0.8) \quad M(t, s) \text{ is of B.V. on } I^2 \text{ and } J(t) \text{ is of B.V. on } I. \text{ Also}$$

$$(0.9) \quad D(\overline{M}) \neq 0.$$

Then the transformation (0.1) carries C onto C in a one to one manner and if $F(y)$ is a measurable functional such that either side of the following equation exists, both sides exist and are equal.

$$(0.10) \quad \int_c^w F(y) d_w y = |D(\overline{M})| \int_c^w F(x(\cdot) + \int_0^1 L(\cdot, s) dx(s)) \exp\{-\Psi(x)\} d_w x$$

where

$$(0.11) \quad \begin{aligned} \Psi(x) &= \int_0^1 \left[\int_0^1 \overline{M}(t, s) dx(s) \right]^2 dt + 2 \int_0^1 \int_0^1 \overline{M}(t, s) dx(s) dx(t) \\ &+ \int_0^1 J(t) d(x(t))^2. \\ &= \int_0^1 \int_0^1 \{ \overline{M}(t, s) + \overline{M}(s, t) + \int_0^1 \overline{M}(t, u) \overline{M}(s, u) du \} dx(s) dx(t). \end{aligned}$$

We prove Theorem A by starting with Theorem B, a theorem of Cameron and Martin [1], which appears below in a slightly weaker form. From Theorem B we develop Theorem C to obtain Theorem A.

THEOREM B. Let $H(t, s)$ be measurable on I^2 and

$$(0.12) \quad \varlimsup_{t \in I} \text{var } H(t, s) < B < \infty$$

independent of s . Assume also that

(0.13) $J(t)$ is continuous and of B.V. on I ,

(0.14) $H(t, s)$ is continuous in s on I for every $t \in I$, and

(0.15) $D(K) \neq 0$ where

$$(0.16) \quad K(t, s) = \begin{cases} \int_0^t H(u, s) du, & 0 \leq t < s \leq 1, \\ \int_0^t H(u, t) du + \frac{1}{2} J(t), & 0 \leq t = s \leq 1, \\ \int_0^t H(u, s) du + J(s), & 0 \leq s < t \leq 1. \end{cases}$$

Then if $F(y)$ is a measurable functional such that either side of the following equation exists, both sides exist and are equal.

$$(0.17) \quad \int_c^w F(y) d_w y = |D(K)| \int_c^w F(x(\cdot)) + \int_0^1 \int_0^{(\cdot)} H(u, s) dux(s) ds \\ + \int_0^{(\cdot)} J(s) x(s) ds \exp\{-\Phi(x)\} d_w x$$

where

$$(0.18) \quad \Phi(x) = \int_0^1 \left\{ \int_0^1 H(t, s) x(s) ds + J(t) x(t) \right\}^2 dt \\ + 2 \int_0^1 \int_0^1 H(t, s) x(s) ds dx(t) + \int_0^1 J(t) d(x(t))^2.$$

THEOREM C. Let $M(t, s)$ and $J(t)$ satisfy (0.7)–(0.9), let $M(t, s)$ be continuous in s on I for each $t \in I$, and let

$$(0.19) \quad J(1) = M(t, 1) = M(1, t) = 0, \quad t \in I.$$

Let $\epsilon > 0$ and define

$$(0.20) \quad M^\epsilon(t, s) = \frac{1}{\epsilon} \int_t^{t+\epsilon} M(t, v) dv, \quad (t, s) \in I^2,$$

where $M(t, v) = 0$ for $v > 1$;

$$(0.21) \quad J^\epsilon(t) = \frac{1}{\epsilon} \int_t^{t+\epsilon} J(u) du, \quad t \in I,$$

where $J(u) = 0$ for $u > 1$; and

$$(0.22) \quad (M^\epsilon)^*(t, s) = \begin{cases} M^\epsilon(t, s), & 0 \leq t < s \leq 1, \\ M^\epsilon(t, s) + \frac{1}{2} J^\epsilon(t), & 0 \leq s = t \leq 1, \\ M^\epsilon(t, s) + J^\epsilon(t), & 0 \leq s < t \leq 1. \end{cases}$$

Then there exists $\delta > 0$ such that if $0 < \epsilon < \delta$ and $F(y)$ is a measurable functional such that either side of the following equation exists, both sides exist and are equal.

$$(0.23) \quad \int_c^w F(y) d_w y = |D(M^\epsilon)^*| \int_c^w F \left(x(\cdot) + \int_0^1 \int_0^{\cdot} (M^\epsilon)^*(u, s) du dx(s) \right) \\ \cdot \exp \left\{ - \int_0^1 \left[\int_0^1 (M^\epsilon)^*(t, s) dx(s) \right]^2 dt \right. \\ \left. - 2 \int_0^1 \int_0^1 M^\epsilon(t, s) dx(s) dx(t) - \int_0^1 J^\epsilon(t) d(x(t))^2 \right\} d_w x.$$

1. In this section we give some lemmas used in the proof of Theorem C.

LEMMA 1. Let $N_\epsilon(t, s)$ be measurable on I^2 and $N_\epsilon(t, t)$ be measurable on I for all $\epsilon > 0$. Let $N_\epsilon(t, s)$ be bounded on I^2 independent of $\epsilon > 0$. Let

$$\lim_{\epsilon \rightarrow 0^+} N_\epsilon(t, s) = N(t, s)$$

almost everywhere on I^2 and

$$\lim_{\epsilon \rightarrow 0^+} N_\epsilon(t, t) = N(t, t)$$

almost everywhere on I . Then

$$(1.1) \quad \lim_{\epsilon \rightarrow 0^+} D(N_\epsilon) = D(N).$$

Proof. Let $\eta > 0$ be given. By application of Hadamard's lemma [3], it follows that there exists an integer K such that

$$\left| D(N_\epsilon) - \sum_{n=0}^K \frac{1}{n!} \int_0^1 \cdots \int_0^1 \begin{vmatrix} N_\epsilon(s_1, s_1) & \cdots & N_\epsilon(s_1, s_n) \\ \vdots & & \vdots \\ N_\epsilon(s_n, s_1) & \cdots & N_\epsilon(s_n, s_n) \end{vmatrix} ds_1 \cdots ds_n \right| < \frac{\eta}{3}$$

independent of $\epsilon > 0$ and

$$\left| D(N) - \sum_{n=0}^K \frac{1}{n!} \int_0^1 \cdots \int_0^1 \begin{vmatrix} N(s_1, s_1) & \cdots & N(s_1, s_n) \\ \vdots & & \vdots \\ N(s_n, s_1) & \cdots & N(s_n, s_n) \end{vmatrix} ds_1 \cdots ds_n \right| < \frac{\eta}{3}.$$

It follows immediately from the hypothesis and bounded convergence that

$$\begin{aligned}
& \lim_{\epsilon \rightarrow 0^+} \sum_{n=1}^K \frac{1}{n!} \int_0^1 \cdots \int_0^1 \left| \begin{array}{ccc} N_\epsilon(s_1, s_1) & \cdots & N_\epsilon(s_1, s_n) \\ \vdots & & \vdots \\ N_\epsilon(s_n, s_1) & \cdots & N_\epsilon(s_n, s_n) \end{array} \right| ds_1 \cdots ds_n \\
&= \sum_{n=1}^K \frac{1}{n!} \int_0^1 \cdots \int_0^1 \left| \begin{array}{ccc} N(s_1, s_1) & \cdots & N(s_1, s_n) \\ \vdots & & \vdots \\ N(s_n, s_1) & \cdots & N(s_n, s_n) \end{array} \right| ds_1 \cdots ds_n.
\end{aligned}$$

Therefore there exists $\delta > 0$ such that $0 < \epsilon < \delta$ implies

$$|D(N_\epsilon) - D(N)| < \eta.$$

This implies (1.1).

The following result was communicated to the author by R. H. Cameron.

LEMMA 2. Let $N(t, s)$ be bounded and measurable on I^2 . Then

$$(1.2) \quad D\left(\int_0^t N(u, s) ds\right) = D\left(\int_0^1 N(t, v) dv\right).$$

Proof. A typical term from the expansion of a determinant in the expansion (0.2) of $D\left(\int_0^t N(u, s) du\right)$ can be written

$$\begin{aligned}
& \int_0^1 \cdots \int_0^1 ds_1 \cdots ds_n \prod_{i=1}^m \int_0^{s_i} N(u_i, s_i) du_i \int_0^{s_{m+1}} N(u_{m+1}, s_{m+2}) du_{m+1} \\
& \quad \cdots \int_0^{s_{n-1}} N(u_{n-1}, s_n) du_{n-1} \int_0^{s_n} N(u_n, s_{m+1}) du_n \\
&= \int_0^1 \cdots \int_0^1 du_1 \cdots du_n \prod_{i=1}^m \int_{u_i}^1 N(u_i, s_i) ds_i \int_{u_{m+1}}^1 N(u_n, s_{m+1}) ds_{m+1} \\
& \quad \cdots \int_{u_{m+2}}^1 N(u_{m+1}, s_{m+2}) ds_{m+2} \cdots \int_{u_n}^1 N(u_{n-1}, s_n) ds_n \\
(1.3) \quad &= \int_0^1 \cdots \int_0^1 ds_1 \cdots ds_n \prod_{i=1}^m \int_{s_i}^1 N(s_i, v_i) dv_i \int_{s_{m+1}}^1 N(s_n, v_{m+1}) dv_{m+1} \\
& \quad \cdots \int_{s_{m+2}}^1 N(s_{m+1}, v_{m+2}) dv_{m+2} \cdots \int_{s_n}^1 N(s_{n-1}, v_n) dv_n \\
&= \int_0^1 \cdots \int_0^1 ds_1 \cdots ds_n \prod_{i=1}^m \int_{s_i}^1 N(s_i, v_i) dv_i \int_{s_{m+2}}^1 N(s_{m+1}, v_{m+2}) dv_{m+2} \\
& \quad \cdots \int_{s_n}^1 N(s_{n-1}, v_n) dv_n \int_{s_{m+1}}^1 N(s_n, v_{m+1}) dv_{m+1}
\end{aligned}$$

by use of the Fubini theorem, a change of dummy variables, and a change in

the order of multiplication. The extreme right hand member of (1.3) is the same corresponding term in the expansion of

$$D\left(\int_0^1 N(t, v)dv\right)$$

as the extreme left hand member of (1.3) is in the expansion of

$$D\left(\int_0^t N(u, s)du\right).$$

This establishes (1.2).

LEMMA 3. Let $M(t, s)$ be bounded and measurable on I^2 and let $J(t)$ be bounded and measurable on I . Let $J^\epsilon(t)$, $M^\epsilon(t, s)$, and $(M^\epsilon)^*(t, s)$ be defined as in (0.20), (0.21) and (0.22) and

$$(1.4) \quad K_\epsilon(t, s) = \begin{cases} -\int_0^t \frac{1}{\epsilon} [M(u, s + \epsilon) - M(u, s)]du, & 0 \leq t < s \leq 1, \\ -\int_0^t \frac{1}{\epsilon} [M(u, s + \epsilon) - M(u, s)]du + \frac{1}{2} J^\epsilon(s), & 0 \leq t = s \leq 1, \\ -\int_0^t \frac{1}{\epsilon} [M(u, s + \epsilon) - M(u, s)]du + J^\epsilon(s), & 0 \leq s < t \leq 1. \end{cases}$$

Then for all $\epsilon > 0$,

$$(1.5) \quad D(K_\epsilon) = D(M^\epsilon)^*.$$

Proof. Let

$$N(t, s) = \frac{1}{\epsilon} [M(t, s + \epsilon) - M(t, s)], \quad \eta > 0,$$

$$\phi_\eta(u) = \begin{cases} 0, & u \leq -\eta, \\ \frac{1}{\eta^2} (u + \eta), & -\eta \leq u \leq 0, \\ -\frac{1}{\eta^2} (u - \eta), & 0 \leq u \leq \eta, \\ 0, & u \geq \eta, \end{cases}$$

and

$$N_\eta(t, s) = -N(t, s) + \phi_\eta(t - s)J^\epsilon(s).$$

Then the following two equations hold insofar as their right hand sides are defined.

$$\int_0^t N_\eta(u, s) du = - \int_0^t N(u, s) du + J^\epsilon(s) \begin{cases} 0, & \eta < t + \eta < s < 1, \\ \frac{1}{2}, & \eta < t = s < 1, \\ 1, & 2\eta < s + \eta < t < 1, \end{cases}$$

and

$$\int_s^1 N_\eta(t, u) du = - \int_s^1 N(t, u) du + \begin{cases} 0, & 0 < t < s - \eta < 1 - \eta, \\ \int_s^{t+\eta} \frac{1}{\eta^2} (t - u + \eta) J^\epsilon(u) du, & 0 < t = s < 1 - \eta, \\ \int_s^{t+\eta} \frac{1}{\eta^2} (t - u + \eta) J^\epsilon(u) du - \int_{t-\eta}^t \frac{1}{\eta^2} (t - u - \eta) J^\epsilon(u) du, & 0 < s < t - \eta < 1 - 2\eta. \end{cases}$$

Since $J^\epsilon(t)$ is continuous on I , we have

$$(1.6) \quad \lim_{\eta \rightarrow 0^+} \int_0^t N_\eta(u, s) du = - \int_0^t N(u, s) dy + J^\epsilon(s) \begin{cases} 0, & 0 < t < s < 1, \\ \frac{1}{2}, & 0 < s = t < 1, \\ 1, & 0 < s < t < 1, \end{cases} \\ = K_\epsilon(t, s)$$

and

$$(1.7) \quad \lim_{\eta \rightarrow 0^+} \int_s^1 N_\eta(t, u) du = - \int_s^1 N(t, u) du + J^\epsilon(t) \begin{cases} 0, & 0 < t < 2 < 1, \\ \frac{1}{2}, & 0 < t = s < 1, \\ 1, & 0 < s < t < 1. \end{cases}$$

Since $N_\eta(t, s)$ is bounded and measurable on I^2 for every $\eta > 0$, we use Lemma 2 to obtain

$$(1.8) \quad D \left(\int_0^t N_\eta(u, s) du \right) = D \left(\int_s^1 N_\eta(t, v) dv \right).$$

Since

$$\lim_{\eta \rightarrow 0^+} \int_s^1 N_\eta(t, v) dv$$

exists almost everywhere on I^2 ,

$$\lim_{\eta \rightarrow 0^+} \int_s^1 N_\eta(t, v) dv$$

exists almost everywhere on I ,

$$\int_s^1 N_\eta(t, v) dv$$

is measurable on I^2 by the Fubini theorem in three dimensions,

$$\int_s^1 N_\eta(t, v) dv$$

is measurable on I by the Fubini theorem, and

$$\int_s^1 N_\eta(t, v) dv$$

is bounded independent of $\eta > 0$, we can use Lemma 1 to obtain

$$(1.9) \quad \lim_{\eta \rightarrow 0^+} D \left(\int_s^1 N_\eta(t, v) dv \right) = D \left(\lim_{\eta \rightarrow 0^+} \int_s^1 N_\eta(t, v) dv \right).$$

Similarly,

$$(1.10) \quad \lim_{\eta \rightarrow 0^+} D \left(\int_0^t N_\eta(u, s) du \right) = D \left(\lim_{\eta \rightarrow 0^+} \int_0^t N_\eta(u, s) du \right).$$

Since

$$\begin{aligned} - \int_s^1 N(t, v) dv &= - \int_s^1 \frac{1}{\epsilon} [M(t, v + \epsilon) - M(t, v)] dv \\ &= - \int_{s+\epsilon}^1 \frac{1}{\epsilon} M(t, v) dv + \int_s^1 \frac{1}{\epsilon} M(t, v) dv \\ &= \frac{1}{\epsilon} \int_s^{s+\epsilon} M(t, v) dv = M^\epsilon(t, s), \end{aligned}$$

we have from (1.7),

$$(1.11) \quad \lim_{\eta \rightarrow 0^+} \int_s^1 N_\eta(t, v) dv = (M^\epsilon)^*(t, s).$$

Therefore (1.6), (1.8), (1.9), (1.10), and (1.11) imply (1.5).

LEMMA 4. *Let $M(t, s)$ be of B.V. on I^2 . Then if $(t_1, s_1) \in I^2$, $M(t, s_1)$ and $M(t_1, s)$ are of B.V. on I . Also $M(t, s)$ is measurable on I^2 , $M(t, t)$ is measurable on I , and for almost every $t \in I$,*

$$(1.12) \quad \lim_{s \rightarrow t^+} M(t, s) = M(t, t).$$

Furthermore, if $\epsilon > 0$ and $M^\epsilon(t, s)$ is defined by (0.20), then there exists $B < \infty$ independent of $\epsilon > 0$ such that

$$(1.13) \quad \text{var}_{(t,s) \in I^2} M^\epsilon(t, s) < B.$$

Proof. Let $(t_1, s_1) \in I^2$. Let $(t_0, s_0) \in I^2$ be such that $M(t, s_0)$ and $M(t_0, s)$ are of B.V. on I and $0 \leq u_0 \leq \dots \leq u_n \leq 1$ be a partition of I . Then

$$\begin{aligned} \sum_{i=1}^n |M(u_i, s_1) - M(u_{i-1}, s_1)| \\ \leq \sum_{i=1}^n |M(u_i, s_1) - M(u_{i-1}, s_1) - M(u_i, s_0) + M(u_{i-1}, s_0)| \\ + \sum_{i=1}^n |M(u_i, s_0) - M(u_{i-1}, s_0)|. \end{aligned}$$

Since the right hand side is bounded independent of the partition $0 \leq u_0 \leq \dots \leq u_n \leq 1$, $M(t, s_1)$ is of B.V. on I . Similarly, $M(t_1, s)$ is of B.V. on I .

Let $(t, s) \in I^2$ and $\{0 \leq t_0 \leq \dots \leq t_n \leq t; 0 \leq s_0 \leq \dots \leq s_m < s\}$ be a partition of $[0, t] \otimes [0, s]$. Let

$$\begin{aligned} P(t, s) &= \sup \sum [M(t_i, s_j) - M(t_{i-1}, s_j) - M(t_i, s_{j-1}) + M(t_{i-1}, s_{j-1})], \\ N(t, s) &= \sup \sum \{-[M(t_i, s_j) - M(t_{i-1}, s_j) - M(t_i, s_{j-1}) + M(t_{i-1}, s_{j-1})]\}, \end{aligned}$$

where the sums are taken over the positive terms only and the suprema are taken over all partitions of $[0, t] \otimes [0, s]$. It is easy to see that

$$(1.14) \quad M(t, s) = P(t, s) - N(t, s) + M(0, s) + M(t, 0) - M(0, 0)$$

and that if $0 \leq u \leq v \leq 1$ and $t \in I$, then

$$(1.15) \quad P(u, u) \leq P(v, v),$$

$$(1.16) \quad P(t, u) \leq P(t, v), \text{ and}$$

$$(1.17) \quad P(u, t) \leq P(v, t).$$

We will show that $P(t, s)$ is measurable on I^2 . Let $\alpha > 0$. Then

$$\phi(t) = \sup_{s \in I} \{s: P(t, s) < \alpha\}, \quad t \in I,$$

is a monotone decreasing function because if $t' < t''$ and $\phi(t') < \phi(t'')$, then there exists s'' such that $\phi(t') < s'' < \phi(t'')$ and according to (1.17), $P(t', s'') \leq P(t'', s'') < \alpha$ so that $\phi(t') \geq s''$, a contradiction. Therefore $\phi(t)$ is measurable and its ordinate set

$$\{(t, s) \in I^2: P(t, s) < \alpha\}$$

is measurable for all real α . Therefore $P(t, s)$ is measurable on I^2 .

From (1.15) it follows that $P(t, t)$ is measurable on I . Similarly, $N(t, s)$ is measurable on I^2 and $N(t, t)$ is measurable on I . Since $M(t, 0)$ and $M(0, s)$ are measurable on I , it follows from (1.14) that $M(t, s)$ is measurable on I^2 and $M(t, t)$ is measurable on I .

Because of (1.15), $P(t, t)$ is continuous almost everywhere on I . Therefore, from (1.16) and (1.17) it follows that for almost all $t \in I$,

$$\lim_{s \rightarrow t^+} P(t, s) = P(t, t).$$

Similarly, for almost all $t \in I$,

$$\lim_{s \rightarrow t^+} N(t, s) = N(t, t).$$

Since $M(0, s)$ is of B.V. on I ,

$$\lim_{s \rightarrow t^+} M(0, s) = M(0, t)$$

for almost all $t \in I$. Therefore (1.12) follows from (1.14).

Let $\epsilon > 0$ and define

$$P^\epsilon(t, s) = \frac{1}{\epsilon} \int_s^{s+\epsilon} P(t, v) dv, \quad (t, s) \in I^2,$$

$$N^\epsilon(t, s) = \frac{1}{\epsilon} \int_s^{s+\epsilon} P(t, v) dv, \quad (t, s) \in I^2,$$

where $P(t, s) = P(t, 1)$ and $N(t, s) = N(t, 1)$ if $s > 1$. Then from (1.14),

$$M^\epsilon(t, s) = P^\epsilon(t, s) - N^\epsilon(t, s) + M^\epsilon(0, s) + M(t, 0) - M(0, 0)$$

and

$$(1.18) \quad \text{var}_{(t,s) \in I^2} M^\epsilon(t, s) < \text{var}_{(t,s) \in I^2} P^\epsilon(t, s) + \text{var}_{(t,s) \in I^2} N^\epsilon(t, s).$$

Let $0 \leq t' \leq t'' \leq 1$ and $0 \leq s' \leq s'' \leq 1$. Then

$$P^\epsilon(t'', s'') - P^\epsilon(t', s'') - P^\epsilon(t'', s') + P^\epsilon(t', s')$$

$$= \frac{1}{\epsilon} \int_{s''}^{s''+\epsilon} [P(t'', v) - P(t', v) - P(t'', v - (s'' - s')) + P(t', v - (s'' - s'))] dv$$

$$\geq 0$$

since

$$P(t'', v) - P(t', v) - P(t'', v - (s'' - s')) + P(t', v - (s'' - s')) \geq 0$$

for all $v, s'' \leq v \leq s'' + \epsilon$ as can be seen from the definition. It follows that

$$\begin{aligned}
 \text{var}_{(t,s) \in I^2} P^\epsilon(t, s) &= P^\epsilon(1, 1) - P^\epsilon(1, 0) - P^\epsilon(0, 1) + P^\epsilon(0, 0) \\
 &\leq P^\epsilon(1, 1) - P^\epsilon(1, 0) \\
 &\leq \frac{1}{\epsilon} \int_1^{1+\epsilon} P(1, 1) dv \leq P(1, 1)
 \end{aligned}$$

independent of $\epsilon > 0$. Similarly,

$$\text{var}_{(t,s) \in I^2} N(t, s) \leq N(1, 1)$$

independent of $\epsilon > 0$. Therefore (1.13) follows from (1.18).

LEMMA 5. Let $M(t, s)$ be of B.V. on I^2 and $J(t)$ be of B.V. on I . Let $\overline{M}(t, s)$, $M^\epsilon(t, s)$, and $(M^\epsilon)^*(t, s)$ be defined by (0.7), (0.20), (0.21), and (0.22). Then

$$(1.19) \quad \lim_{\epsilon \rightarrow 0^+} D(M^\epsilon)^* = D(\overline{M}).$$

Proof. We will show that $M^\epsilon(t, s)$ is of B.V. on I^2 . Since $M^\epsilon(t, 1) = 0$, $t \in I$, and $M^\epsilon(0, s)$ is absolutely continuous on I , it follows from Lemma 4 that $M^\epsilon(t, s)$ is of B.V. on I^2 . Since $J^\epsilon(t)$ is measurable, we conclude from Lemma 4 that $(M^\epsilon)^*(t, s)$ is measurable on I^2 and $(M^\epsilon)^*(t, s)$ is measurable on I . Since $M(t, s)$ is bounded on I^2 , it follows that $M^\epsilon(t, s)$ is bounded independent of $\epsilon > 0$. Since $J(t)$ is bounded, $(M^\epsilon)^*(t, s)$ is bounded independent of $\epsilon > 0$. From Lemma 4 we know that $M(t, s)$ is of B.V. in s on I for all $t \in I$. Therefore

$$\lim_{\epsilon \rightarrow 0^+} M^\epsilon(t, s) = M(t, s)$$

almost everywhere on I^2 . From conclusion (1.12) of Lemma 4 it follows that

$$\lim_{\epsilon \rightarrow 0^+} M^\epsilon(t, t) = M(t, t)$$

almost everywhere on I . Since $J(t)$ is of B.V. we have

$$\lim_{\epsilon \rightarrow 0^+} J^\epsilon(t) = J(t)$$

almost everywhere on I . Therefore

$$\lim_{\epsilon \rightarrow 0^+} (M^\epsilon)^*(t, s) = \overline{M}(t, s)$$

almost everywhere on I^2 and

$$\lim_{\epsilon \rightarrow 0^+} (M^\epsilon)^*(t, t) = \overline{M}(t, t)$$

almost everywhere on I . Therefore (1.19) follows from conclusion (1.1) of Lemma 1.

2. Proof of Theorem C. We make the following manipulations so that we can use Theorem B.

$$\begin{aligned}
 \int_0^1 \int_0^t (M^\epsilon)^*(u, s) du dx(s) &= \int_0^1 \int_0^t M^\epsilon(u, s) du dx(s) + \int_0^t \int_s^t J^\epsilon(u) du dx(s) \\
 &= \int_0^1 \int_0^t \frac{1}{\epsilon} \int_s^{s+\epsilon} M(u, v) dv du dx(s) - \int_0^t x(s) d_s \int_s^t J^\epsilon(u) du \\
 (2.1) \quad &= - \int_0^1 x(s) d_s \frac{1}{\epsilon} \int_s^{s+\epsilon} \int_0^t M(u, v) du dv + \int_0^t x(s) J^\epsilon(s) ds \\
 &= \int_0^1 \left[- \int_0^t \frac{1}{\epsilon} [M(u, s + \epsilon) - M(u, s)] du \right] x(s) ds + \int_0^t J^\epsilon(s) x(s) ds.
 \end{aligned}$$

Now for fixed $\epsilon > 0$,

$$- \frac{1}{\epsilon} [M(t, s + \epsilon) - M(t, s)]$$

satisfies (0.12) and satisfies (0.14) because $M(t, s)$ is continuous on $0 < s < \infty$ for all $t \in I$. $J^\epsilon(t)$ satisfies (0.13). From Lemma 5 and condition (0.9) we know there exists $\delta_1 > 0$ such that for $0 < \epsilon < \delta_1$,

$$D((M^\epsilon)^*(t, s)) \neq 0.$$

Therefore, from (1.4) and conclusion (1.5) of Lemma 3, condition (0.15) of Theorem B is satisfied when $0 < \epsilon < \delta_1$. Therefore we can write (0.17) with $H(t, s)$ replaced by $-(M(t, s + \epsilon) - M(t, s))/\epsilon$ and $J(t)$ replaced by $J^\epsilon(t)$ and we have by (1.5), (0.17), and (2.1), if $f(y)$ is measurable on C and $0 < \epsilon < \delta_1$,

$$\begin{aligned}
 \int_c^w F(y) d_w y &= |D((M^\epsilon)^*(t, s))| \int_c^w F\left(x(\cdot) + \int_0^1 \int_0^{\cdot} (M^\epsilon)^*(u, s) du dx(s)\right) \\
 &\quad \cdot \exp \left\{ - \int_0^1 \left\{ \int_0^1 \left[- \frac{1}{\epsilon} [M(t, s + \epsilon) - M(t, s)] \right] x(s) ds + J^\epsilon(t) x(t) \right\}^2 dt \right. \\
 &\quad \left. - 2 \int_0^1 \int_0^1 - \frac{1}{\epsilon} [M(t, s + \epsilon) - M(t, s)] x(s) ds dx(t) \right. \\
 &\quad \left. - \int_0^1 J^\epsilon(t) d(x(t))^2 \right\} d_w x \\
 &= |D(M^\epsilon)^*| \int_c^w F\left(x(\cdot) + \int_0^1 \int_0^{\cdot} (M^\epsilon)^*(u, s) du dx(s)\right) \\
 &\quad \cdot \exp \left\{ - \int_0^1 \left\{ \int_0^1 (M^\epsilon)^*(t, s) dx(s) \right\}^2 dt - 2 \int_0^1 \int_0^1 M^\epsilon(t, s) dx(s) dx(t) \right. \\
 &\quad \left. - \int_0^1 J^\epsilon(t) d(x(t))^2 \right\} d_w x,
 \end{aligned}$$

provided either side exists. This proves Theorem C.

3. In this section we prove some lemmas which we use in letting $\epsilon \rightarrow 0^+$.

LEMMA 6. Let $N(t, s)$ be measurable in t on I for every $s \in I$ and let

$$|N(t, s)| < B < \infty$$

and

$$\text{var}_{s \in I} N(t, s) < B < \infty,$$

where B is independent of $(t, s) \in I^2$. Then if $x \in C$,

$$\int_0^1 \int_0^t N(u, s) du dx(s)$$

exists and equals

$$\int_0^t \int_0^1 N(u, s) dx(s) du$$

for all $t \in I$.

Proof. For every $u \in I$, we have

$$\lim_{\text{norm } P \rightarrow 0^+} \sum_{i=1}^n N(u, s_i) [x(s_i) - x(s_{i-1})] = \int_0^1 N(u, s) dx(s)$$

where P is the partition

$$0 = s_0 \leq \dots \leq s_n = 1.$$

From the hypothesis it follows that the limitand on the left is measurable and bounded independent of the partition. Then from the bounded convergence theorem, we have

$$\int_0^1 \int_0^t N(u, s) du dx(s)$$

exists and equals

$$\int_0^t \int_0^1 N(u, s) dx(s) du.$$

LEMMA 7. Let $M(t, s)$ be of B.V. on I^2 and $J(t)$ be of B.V. on I . Let $(M^*)^*(t, s)$ and $\overline{M}(t, s)$ be defined by (0.22) and (0.7) respectively. Then

$$\int_0^1 (M^*)^*(t, s) dx(s)$$

converges in Hilbert norm on $C \otimes I$ to

$$\int_0^1 \overline{M}(t, s) dx(s)$$

as $\epsilon \rightarrow 0^+$.

Proof. By a theorem of [2] and Fubini's theorem,

$$\begin{aligned} & \int_{c \otimes I}^w \left(\int_0^1 [(M^\epsilon)^*(t, s) - M(t, s)] dx(s) \right)^2 d_w(x \otimes t) \\ &= \int_0^1 \frac{1}{2} \int_0^1 [(M^\epsilon)^*(t, s) - \overline{M}(t, s)]^2 ds dt \\ &= \frac{1}{2} \int_{I^2} [(M^\epsilon)^*(t, s) - \overline{M}(t, s)]^2 d(s \otimes t). \end{aligned}$$

The integrand on the right is bounded and tends to zero almost everywhere on I^2 as ϵ tends to 0^+ because for every $t \in I$, $M(t, s)$ is a continuous function of s almost everywhere on I . The conclusion follows by bounded convergence.

LEMMA 8. Let $M(t, s)$ be of B.V. on I^2 , $M(t, 1) = M(1, t) = 0$, $t \in I$, and $x \in C$. Then

$$\int_0^1 \int_0^1 M(t, s) dx(s) dx(t)$$

exists and equals

$$\int_{I^2} x(t)x(s) dM(t, s).$$

Proof. We need to show that

$$\int_0^1 M(t, s) dx(s)$$

is of B.V. Let $0 \leq t_0 \leq \dots \leq t_n \leq 1$ be a partition of I . Then $M(t, 1) = 0$, $t \in I$, and we have

$$\begin{aligned} (3.1) \quad & \sum_{i=1}^n \left| \int_0^1 M(t_i, s) dx(s) - \int_0^1 M(t_{i-1}, s) dx(s) \right| \\ &= \sum_{i=1}^n \left| \int_0^1 x(s) d[M(t_i, s) - M(t_{i-1}, s)] \right| \\ &\leq \|x\| \sum_{i=1}^n \text{var}_{s \in I} [M(t_i, s) - M(t_{i-1}, s)]. \end{aligned}$$

$M(t_i, s)$ is of B.V. in s on I for each $i = 0, 1, \dots, n$, by Lemma 4. Therefore,

we can find n partitions $\{0 \leq s^{(i)} \leq \dots \leq s_{m_i}^{(i)} \leq 1\}_{i=1}^n$ such that

$$\begin{aligned} \text{var}_{s \in I} [M(t_i, s) - M(t_{i-1}, s)] \\ < \frac{1}{n} + \sum_{j=1}^{m_i} |M(t_i, s_j^{(i)}) - M(t_{i-1}, s_j^{(i)}) - M(t_i, s_{j-1}^{(i)}) + M(t_{i-1}, s_{j-1}^{(i)})|, \end{aligned}$$

$i = 1, 2, \dots, n$. Then if $0 \leq s_0 \leq \dots \leq s_m \leq 1$ is the union of the partitions $\{0 \leq s^{(i)} \leq \dots \leq s_{m_i}^{(i)} \leq 1\}_{i=1}^n$,

$$\begin{aligned} \sum_{i=1}^n \text{var}_{s \in I} [M(t_i, s) - M(t_{i-1}, s)] \\ (3.2) \quad \leq 1 + \sum_{i=1}^n \sum_{j=1}^{m_i} |M(t_i, s_j) - M(t_{i-1}, s_j) - M(t_i, s_{j-1}) + M(t_{i-1}, s_{j-1})| \\ \leq 1 + \text{var}_{(t,s) \in P} M(t, s). \end{aligned}$$

Now (3.1) and (3.2) show that $\int_0^1 M(t, s) dx(s)$ is of B.V. Therefore

$$\int_0^1 \int_0^1 M(t, s) dx(s) dx(t)$$

exists.

Let $\epsilon > 0$ be given. Since $x \in C$ and

$$\text{var}_{(t,s) \in P} M(t, s) < \infty,$$

$$\int_{I^2} x(t)x(s) dM(t, s)$$

exists. Since $M(1, s) = M(t, 1) = 0$,

$$(3.3) \quad \int_{I^2} x(t)x(s) dM(t, s) = \int_{I^2} M(t, s) d(x(t)x(s)).$$

Choose δ such that if the partitions $T, 0 = t_0 \leq \dots \leq t_n = 1$, and $S, 0 = s_0 \leq \dots \leq s_m = 1$, have norm less than δ , then

$$\begin{aligned} (3.4) \quad & \left| \int_{I^2} M(t, s) d(x(t)x(s)) \right. \\ & \left. - \sum_{i=1}^n \sum_{j=1}^{m_i} M(t_i, s_j) (x(s_j) - x(s_{j-1})) (x(t_i) - x(t_{i-1})) \right| < \frac{\epsilon}{3} \end{aligned}$$

and

$$(3.5) \quad \left| \int_0^1 \int_0^1 M(t, s) dx(s) dx(t) - \sum_{i=1}^n \int_0^1 M(t_i, s) dx(s) (x(t_i) - x(t_{i-1})) \right| < \frac{\epsilon}{3}.$$

Let T be fixed with norm $T < \delta$. Choose δ' such that if norm $S < \delta'$, then for $i = 1, 2, \dots, n$,

$$(3.6) \quad \left| \int_0^1 M(t_i, s) dx(s) - \sum_{j=1}^m M(t_i, s_j)(x(s_j) - x(s_{j-1})) \right| < \frac{\epsilon}{6n \|x\| + 1}.$$

Let norm $S < \min(\delta, \delta')$. Using (3.4)–(3.6) we obtain

$$\left| \int_{I^2} M(t, s) d(x(t)x(s)) - \int_0^1 \int_0^1 M(t, s) dx(s) dx(t) \right| < \epsilon.$$

Since ϵ is arbitrary, we have

$$\int_{I^2} M(t, s) d(x(t)x(s)) = \int_0^1 \int_0^1 M(t, s) dx(s) dx(t).$$

Therefore the conclusion follows from this and (3.3).

LEMMA 9. Let $M(t, s)$ be of B.V. on I^2 and $M(t, 1) = M(1, s) = 0$ and let $M^\epsilon(t, s)$ be defined as in (0.20). Then

$$\text{l.i.m.}_{\epsilon \rightarrow 0^+} \int_0^1 \int_0^1 M^\epsilon(t, s) dx(s) dx(t) = \int_0^1 \int_0^1 M(t, s) dx(s) dx(t)$$

over C .

Proof. Let $N_\epsilon(t, s) = M^\epsilon(t, s) - M(t, s)$. By Lemma 4, $N_\epsilon(t, s)$ is of B.V. on I^2 . Also $N_\epsilon(t, 1) = N_\epsilon(1, s) = 0$. By Lemma 8,

$$\begin{aligned} \left[\int_0^1 \int_0^1 N_\epsilon(t, s) dx(s) dx(t) \right]^2 &= \left[\int_{I^2} x(t)x(s) dN_\epsilon(t, s) \right]^2 \\ (3.7) \quad &= \int_{I^2} \int_{I^2} x(t)x(s)x(u)x(v) dN_\epsilon(t, s) dN_\epsilon(u, v) \\ &= \int_{I^2 \otimes I^2} x(t)x(s)x(u)x(v) d(N_\epsilon(u, v)N_\epsilon(t, s)) \end{aligned}$$

from the Fubini theorem. Also from the Fubini theorem,

$$\begin{aligned} \int_c^w \left(\int_0^1 \int_0^1 N_\epsilon(t, s) dx(s) dx(t) \right)^2 d_w x \\ (3.7) \quad &= \int_c^w \int_{I^2 \otimes I^2} x(t)x(s)x(u)x(v) d(N_\epsilon(u, v)N_\epsilon(t, s)) d_w x \\ &= \int_{I^2 \otimes I^2} U(t, s, u, v) d(N_\epsilon(u, v)N_\epsilon(t, s)), \end{aligned}$$

where

$$U(t, s, u, v) = \int_c^w x(t)x(s)x(u)x(v)dx, \quad (t, s, u, v) \in I^2 \otimes I^2.$$

The use of the Fubini theorem is justified since $|||x|||$ ⁴ is integrable on C . Since if $0 \leq t_1 \leq t_2 \leq t_3 \leq t_4$,

$$\int_c^w x(t_1)x(t_2)x(t_3)x(t_4)d_w x = t_1 \left(\frac{t_2}{2} + \frac{t_3}{4} \right),$$

$U(t, s, u, v)$ is absolutely continuous on $I^2 \otimes I^2$. Since $U(t, s, u, v)$ is zero if any argument is zero and $N_\epsilon(t, 1)$ and $N_\epsilon(1, s)$ are zero, we have on integrating by parts,

$$(3.8) \quad \int_{I^2 \otimes I^2} U(t, s, u, v) d(N_\epsilon(u, v)N_\epsilon(t, s)) = \int_{I^2 \otimes I^2} N_\epsilon(t, s)N_\epsilon(u, v) dU(t, s, u, v).$$

For every fixed $t \in I$, $M(t, s)$ is continuous in s almost everywhere on I . Therefore $N_\epsilon(t, s)$ converges almost everywhere to zero as $\epsilon \rightarrow 0^+$. Since $N_\epsilon(t, s)$ is bounded on I^2 and $U(t, s, u, v)$ is absolutely continuous, the right hand side of (3.8) tends to zero as $\epsilon \rightarrow 0^+$. Using (3.7) the lemma is established.

LEMMA 10. *Let $J(t)$ be of B.V. on I and $J(1) = 0$. Let $J^\epsilon(t)$ be defined by (0.21). Then*

$$\text{l.i.m.}_{\epsilon \rightarrow 0^+} \int_0^1 J^\epsilon(t) d(x(t))^2 = \int_0^1 J(t) d(x(t))^2 \text{ over } C.$$

Proof. The proof is similar to the proof of Lemma 9. Let $N_\epsilon(t) = J^\epsilon(t) - J(t)$. By using Lemma 8 and the Fubini theorem,

$$\begin{aligned} \int_C^w \left(\int_0^1 N_\epsilon(t) d(x(t))^2 \right)^2 d_w x &= \int_C^w \left(\int_0^1 \int_0^1 N_\epsilon(t) N_\epsilon(s) d(x(t))^2 d(x(s))^2 \right) d_w x \\ &= \int_C^w \int_{I^2} (x(t)x(s))^2 d(N_\epsilon(t)N_\epsilon(s)) d_w x \\ &= \int_{I^2} \chi(t, s) d(N_\epsilon(t)N_\epsilon(s)) \\ &= \int_{I^2} N_\epsilon(t)N_\epsilon(s) d\chi(t, s), \end{aligned}$$

where $\chi(t, s) = \int_C^w (x(t)x(s))^2 d_w x$ is absolutely continuous. The conclusion follows by bounded convergence since $J(t)$ is bounded.

4. Proof of Theorem A. We assume condition (0.19) temporarily. Let $F(y)$ be bounded and continuous in the uniform topology and vanish if $|||y||| \geq R$.

From Lemmas 7, 9, and 10, there exists a sequence $\{\epsilon_n\}$ such that

$$\lim_{n \rightarrow \infty} \epsilon_n = 0$$

and

$$(4.1) \quad \lim_{n \rightarrow \infty} \int_0^1 (M^{\epsilon_n})^*(t, s) dx(s) = \int_0^1 \overline{M}(t, s) dx(s)$$

almost everywhere on $C \otimes I$,

$$(4.2) \quad \lim_{n \rightarrow \infty} \int_0^1 \int_0^1 M^{\epsilon_n}(t, s) dx(s) dx(t) = \int_0^1 \int_0^1 \overline{M}(t, s) dx(s) dx(t)$$

almost everywhere on C , and

$$(4.3) \quad \lim_{n \rightarrow \infty} \int_0^1 J^{\epsilon_n}(t) d(x(t))^2 = \int_0^1 J(t) d(x(t))^2$$

almost everywhere on C .

Consider

$$(4.4) \quad \left| \int_0^t \int_0^1 (M^{\epsilon_n})^*(u, s) dx(s) du - \int_0^t \int_0^1 \overline{M}(u, s) dx(s) du \right| \\ \leq \int_0^1 \left| \int_0^1 (M^{\epsilon_n})^*(u, s) dx(s) - \int_0^1 \overline{M}(u, s) dx(s) \right| du.$$

Since by Lemma 4

$$\text{var}_{(t,s) \in I^2} M^{\epsilon}(t, s)$$

is bounded independent of ϵ and since $M^{\epsilon}(1, s) = 0$ and $J^{\epsilon}(t)$ is bounded independent of ϵ and t ,

$$\text{var}_{s \in I} (M^{\epsilon})^*(t, s)$$

is bounded independent of t and ϵ . Therefore the integrand on the right of (4.4) is bounded on I independent of $\epsilon > 0$ for every $x \in C$. By (4.1) this integrand tends to zero as n tends to ∞ for almost all u on I for almost all $x \in C$. It follows from (4.4), Lemma 6, and bounded convergence that

$$(4.5) \quad \lim_{n \rightarrow \infty} \int_0^1 \int_0^t (M^{\epsilon_n})^*(u, s) du dx(s) = \int_0^1 \int_0^t \overline{M}(u, s) du dx(s)$$

uniformly in t on I for almost all $x \in C$.

From Lemma 4 it follows that

$$\int_0^1 M^\epsilon(t, s) dx(s)$$

is bounded on I independent of ϵ for every $x \in C$. Since $J^\epsilon(t)$ is bounded on I independent of ϵ , we have from (4.1) and bounded convergence,

$$(4.6) \quad \lim_{n \rightarrow \infty} \int_0^1 \left[\int_0^1 (M^{\epsilon_n})^*(t, s) dx(s) \right]^2 dt = \int_0^1 \left(\int_0^1 \overline{M}(t, s) dx(s) \right)^2 dt$$

for almost every $x \in C$.

We will now show that there exists R_1 independent of n such that for sufficiently large n , $n > N$,

$$F \left(x(\cdot) + \int_0^1 \int_0^{\cdot} (M^{\epsilon_n})^*(u, s) du dx(s) \right)$$

vanishes if

$$|||x||| \geq R_1.$$

From (1.19) of Lemma 5,

$$(4.7) \quad \lim_{\epsilon \rightarrow 0^+} D(M^\epsilon)^* = D(\overline{M}).$$

From (0.9) there exists N such that if $n > N$, $D(M^{\epsilon_n})^*$ is bounded from zero. We shall assume from now on that $n > N$. From [3] we know there exists the Volterra reciprocal kernel $((M^{\epsilon_n})^*)^{-1}(t, s)$ such that

$$(4.8) \quad \begin{aligned} ((M^{\epsilon_n})^*)^{-1}(t, s) + (M^{\epsilon_n})^*(t, s) &= - \int_0^1 ((M^{\epsilon_n})^*)^{-1}(t, u) (M^{\epsilon_n})^*(u, s) du \\ &= - \int_0^1 (M^{\epsilon_n})(t, u) ((M^{\epsilon_n})^*)^{-1}(u, s) du, \end{aligned}$$

and $((M^{\epsilon_n})^*)^{-1}(t, s)$ is bounded on I^2 independent of n . From (4.8) and Lemma 4, (1.13),

$$(4.9) \quad \begin{aligned} &\text{var}_{s \in I} (M^{\epsilon_n})^*)^{-1}(t, s) \\ &< \text{var}_{s \in I} (M^{\epsilon_n})^*(t, s) + \text{var}_{s \in I} \int_0^1 ((M^{\epsilon_n})^*)^{-1}(t, u) (M^{\epsilon_n})^*(u, s) du \\ &< \text{var}_{s \in I} (M^{\epsilon_n})^*(t, s) \left[1 + \sup_{(t, s) \in I^2} |((M^{\epsilon_n})^*)^{-1}(t, s)| \right] \\ &< B, \end{aligned}$$

where B is independent of t and n . Therefore from (4.9) and Lemma 6 which we use by virtue of (4.8) and (4.9), if $|||y||| < R$, then

$$\begin{aligned}
 (4.10) \quad & \left\| y(t) + \int_0^1 \int_0^t ((M^{\epsilon_n})^*)^{-1}(u, s) du dy(s) \right\| \\
 & \leq R \left[1 + B + \sup_{t \in I} |((M^{\epsilon_n})^*)^{-1}(t, 1)| \right] < R_1
 \end{aligned}$$

which is bounded independent of n .

Consider

$$(4.11) \quad y(t) = x(t) + \int_0^1 \int_0^t (M^{\epsilon_n})^*(u, s) du dx(s).$$

Then by Lemma 6 and (4.8),

$$\begin{aligned}
 (4.12) \quad & y(t) + \int_0^1 \int_0^t ((M^{\epsilon_n})^*)^{-1}(u, s) du dy(s) \\
 & = x(t) + \int_0^1 \int_0^t (M^{\epsilon_n})^*(u, s) du dx(s) + \int_0^1 \int_0^t ((M^{\epsilon_n})^*)^{-1}(u, s) du dx(s) \\
 & \quad + \int_0^1 \int_0^t ((M^{\epsilon_n})^*)^{-1}(u, s) du \int_0^1 \int_0^s (M^{\epsilon_n})^*(w, v) dw dx(v) \\
 & = x(t) + \int_0^1 \int_0^t [(M^{\epsilon_n})^*(u, s) + ((M^{\epsilon_n})^*)^{-1}(u, s)] du dx(s) \\
 & \quad + \int_0^1 \int_0^t ((M^{\epsilon_n})^*)^{-1}(u, s) du \int_0^1 (M^{\epsilon_n})^*(s, v) dx(v) ds \\
 & = x(t) + \int_0^1 \int_0^t [(M^{\epsilon_n})^*(u, v) + ((M^{\epsilon_n})^*)^{-1}(u, v)] du dx(v) \\
 & \quad + \int_0^1 \int_0^t \left[\int_0^1 ((M^{\epsilon_n})^*)^{-1}(u, s) (M^{\epsilon_n})^*(s, v) ds \right] du dx(v) \\
 & = x(t).
 \end{aligned}$$

From (4.10)–(4.12) it follows that there exists R_1 independent of n such that if

$$\|x\| > R_1,$$

then

$$\left\| x(t) + \int_0^1 \int_0^t (M^{\epsilon_n})^*(u, s) du dx(s) \right\| \geq R.$$

Therefore

$$F\left(x(\cdot) + \int_0^1 \int_0^{\cdot} (M^{\epsilon_n})^*(u, s) du dx(s)\right)$$

vanishes if $|||x||| > R_1$.

From Lemmas 4 and 8

$$\int_0^1 \int_0^1 M^{\epsilon n}(t, s) dx(s) dx(t)$$

is bounded independent of n and $x \in C$ as long as $|||x||| < R_1$. Also

$$\int_0^1 J^{\epsilon n}(t) d(x(t))^2$$

is bounded independent of n and $x \in C$ as long as $|||x||| < R_1$ because

$$\text{var}_{t \in I} J^{\epsilon}(t)$$

is bounded independent of $\epsilon > 0$. Because

$$F\left(x(\cdot) + \int_0^1 \int_0^{\cdot} (M^{\epsilon n})^*(u, s) du dx(s)\right)$$

vanishes if $|||x||| \geq R_1$ and is bounded and $F(y)$ is continuous in the uniform topology and because of (4.5), (4.6), (4.7), (4.2) and (4.3) we have, if (0.23) holds in some range $0 < \epsilon < \delta$, by bounded convergence,

$$\begin{aligned} \int_c^w F(y) d_w y &= |D(\overline{M})| \int_c^w F\left(x(\cdot) + \int_0^1 \int_0^{\cdot} \overline{M}(u, s) du dx(s)\right) \\ (4.13) \quad &\cdot \exp \left\{ - \int_0^1 \left(\int_0^1 \overline{M}(t, s) dx(s) \right)^2 dt \right. \\ &\quad \left. - 2 \int_0^1 \int_0^1 \overline{M}(t, s) dx(s) dx(t) - \int_0^1 J(t) d(x(t))^2 \right\} d_w x. \end{aligned}$$

Therefore, under the hypothesis of Theorem A, the restrictions on $F(y)$, and condition (0.19), if (0.23) holds in a range $0 < \epsilon < \delta$, then (4.13) holds. By Lemmas 4 and 5, there exists δ_2 such that if $0 < \eta < \delta_2$ the hypothesis of Theorem C is satisfied when $M(t, s)$ and $J(t)$ are replaced by $M^\eta(t, s)$ and $J^\eta(t)$ respectively. Consequently there exists $\delta_3 > 0$ such that (0.23) holds for $0 < \epsilon < \delta_3$ and $0 < \eta < \delta_2$ with $M(t, s)$ and $J(t)$ replaced by $M^\eta(t, s)$ and $J^\eta(t)$ respectively so that (4.13) holds with $M(t, s)$ and $J(t)$ replaced by $M^\eta(t, s)$ and $J^\eta(t)$ respectively for $0 < \eta < \delta_2$. Therefore (4.13) holds. We may remove condition (0.19) since the values of $J(1)$, $M(t, 1)$, and $M(1, s)$ do not affect the formula (4.13) provided the hypothesis of Theorem A still holds.

From (0.4), (0.5) and (0.6) it follows that

$$(4.14) \quad L(t, s) = \int_0^t \overline{M}(u, s) du$$

for all $(t, s) \in I^2$. Therefore (0.10) follows from (4.13) when $F(y)$ is continuous in the uniform topology, is bounded, and vanishes outside a uniform sphere. We can progressively enlarge the class of functionals for which (0.10) holds to the class of all measurable functionals as done in [1, p. 215].

Since $D(\overline{M}) \neq 0$ there is a Volterra reciprocal kernel, $\overline{M}^{-1}(t, s)$, such that

$$\begin{aligned} \overline{M}^{-1}(t, s) + M(t, s) &= - \int_0^1 \overline{M}^{-1}(t, u) \overline{M}(u, s) du \\ (4.15) \qquad \qquad \qquad &= - \int_0^1 \overline{M}(t, u) \overline{M}^{-1}(u, s) du. \end{aligned}$$

Proceeding very much as in (4.12) one can show with the aid of (4.15) and (4.14) that the transformation (0.1) carries C onto C in a one to one manner.
