ERRATA TO VOLUME 139

Kurt Kreith. *Sturmian theorems and positive resolvents*, pp. 319–327.

The criterion for u_0-positivity used in Theorem 3.2 is valid in $C(\Omega)$, not $\mathscr{L}^2(\Omega)$. Thus the present statement of the arguments of §3 would require the additional hypothesis that $(L_s + \gamma I)^{-1}$ is compact in $C(\Omega)$.

However the assumption of compactness is required only to show existence in connection with property (*) while uniqueness follows from u_0-positivity alone. Since existence is hypothesized throughout §3, the stated results remain valid.
