CONFORMALITY AND ISOMETRY OF RIEMANNIAN MANIFOLDS TO SPHERES⁽¹⁾

BY

CHUAN-CHIH HSIUNG⁽²⁾ AND LOUIS W. STERN

Abstract. Suppose that a compact Riemannian manifold M^n of dimension $n > 2$ admits an infinitesimal nonisometric conformal transformation v . Some curvature conditions are given for M^n to be conformal or isometric to an n -sphere under the initial assumption that $L_v R = 0$, where L_v is the operator of the infinitesimal transformation v and R is the scalar curvature of M^n . For some special cases, these conditions were given by Yano [10] and Hsiung [2].

1. Introduction. Let M^n be a Riemannian manifold of dimension $n \geq 2$ and class C^3 , (g_{ij}) the symmetric matrix of the positive definite metric of M^n , and (g^{ij}) the inverse matrix of (g_{ij}) , and denote by ∇_i , R_{hijk} , $R_{ij} = R^k_{ijk}$ and $R = g^{ij}R_{ij}$ the operator of covariant differentiation with respect to g_{ij} , the Riemann tensor, the Ricci tensor and the scalar curvature of M^n respectively. Let d be the operator of exterior derivation, δ the operator of coderivation, and $\Delta = d\delta + \delta d$ the Laplace-Beltrami operator. Throughout this paper all Latin indices take the values $1, \dots, n$ unless stated otherwise. We shall follow the usual tensor convention that indices can be raised and lowered by using g^{ij} and g_{ij} respectively, and that repeated indices imply summation.

Let v be a vector field defining an infinitesimal conformal transformation on M^n . Denote by the same symbol v the 1-form corresponding to the vector field v by the duality defined by the metric of M^n , and by L_v the operator of the infinitesimal transformation v . Then we have

$$(1.1) \quad L_v g_{ij} = \nabla_i v_j + \nabla_j v_i = 2\rho g_{ij}.$$

The infinitesimal transformation v is said to be homothetic or an infinitesimal isometry according as the scalar function ρ is constant or zero. On a compact orientable Riemannian manifold, an infinitesimal homothetic transformation is necessarily an infinitesimal isometry; see [9]. We also denote by $L_{d\rho}$ the operator of the infinitesimal transformation generated by the vector field ρ^i defined by

$$(1.2) \quad \rho^i = g^{ij}\rho_j, \quad \rho_j = \nabla_j \rho.$$

Let $\xi_{I(p)}$ and $\eta_{I(p)}$ be two tensor fields of the same order $p \leq n$ on a compact orientable manifold M^n , where $I(p)$ denotes an ordered subset $\{i_1, \dots, i_p\}$ of the set $\{1, \dots, n\}$ of positive integers less than or equal to n . Then the local and global scalar products $\langle \xi, \eta \rangle$ and (ξ, η) of the tensor fields ξ and η are defined by

$$(1.3) \quad \langle \xi, \eta \rangle = (1/p!) \xi^{I(p)} \eta_{I(p)},$$

$$(1.4) \quad (\xi, \eta) = \int_{M^n} \langle \xi, \eta \rangle dV,$$

where dV is the element of volume of the manifold M^n at a point. We also define

$$(1.5) \quad \|\xi\| = p! \langle \xi, \xi \rangle.$$

From (1.3) and (1.4) it follows that (ξ, ξ) is nonnegative, and that $(\xi, \xi) = 0$ implies that $\xi = 0$ on the whole manifold M^n .

In the last decade or so various authors have studied the conditions for a Riemannian manifold M^n of dimension $n > 2$ with constant scalar curvature R to be either conformal or isometric to an n -sphere. Very recently Yano, Obata, Hsiung and Mugridge (see [13], [10], [4]) have been able to extend some of these results by replacing the constancy of R by $L_u R = 0$, where u is a certain vector field on M^n . The purpose of this paper is to continue their work, in particular Yano's [10], by establishing the following theorems.

To begin we denote by (C) the following condition:

(C) A compact Riemannian manifold M^n of dimension $n > 2$ admits an infinitesimal nonisometric conformal transformation v satisfying (1.1) with $\rho \neq 0$ such that $L_v R = 0$.

THEOREM I. *An orientable M^n is conformal to an n -sphere if it satisfies condition (C) and*

$$(1.6) \quad \left(\rho_i \rho^i - \frac{1}{n-1} R \rho^2, R \right) \geq 0,$$

$$(1.7) \quad L_v \left(a^2 A + \frac{c - 4a^2}{n-2} B \right) = 0,$$

where A and B are defined by

$$(1.8) \quad A = R^{hij k} R_{hij k}, \quad B = R^{ij} R_{ij},$$

and a, c are constant such that

$$(1.9) \quad c \equiv 4a^2 + (n-2) \left[2a \sum_{i=1}^4 b_i + \left(\sum_{i=1}^6 (-1)^{i-1} b_i \right)^2 - 2(b_1 b_3 + b_2 b_4 - b_5 b_6) + (n-1) \sum_{i=1}^6 b_i^2 \right] > 0,$$

b 's being any constants⁽³⁾.

⁽³⁾ An elementary calculation shows that $c \geq 0$, where equality holds if and only if $b_1 = \dots = b_4, b_5 = b_6 = 0, a = -(n-2)b_1$.

For the case $a \neq 0$, $c - 4a^2 = 0$ and the case $a = 0$, $c - 4a^2 \neq 0$, Theorem I is due to Yano [10].

THEOREM II. *A manifold M^n is conformal to an n -sphere if it satisfies condition (C) and any one of the following three sets of conditions:*

$$(1.10) \quad \nabla_i \nabla_j (Rf) = R\rho g_{ij} \quad (f \text{ is a scalar function}),$$

$$(1.11) \quad Qd\rho = (2/n) d(R\rho), \quad \nabla_i \nabla_j (R\rho) = R\nabla_i \nabla_j \rho,$$

$$(1.12) \quad L_v R_{ij} = \alpha g_{ij} \quad (\alpha \text{ is a scalar function}),$$

where Q is the operator of Ricci defined by, for any vector field u on M^n ,

$$(1.13) \quad Q: u_i \rightarrow 2R_{ij}u^j.$$

For constant R , conditions (1.11) and (1.12) in Theorem II will lead to the conclusion that M^n is isometric to an n -sphere of radius $(n(n-1)/R)^{1/2}$; for this see [12].

THEOREM III. *A manifold M^n with constant R is isometric to an n -sphere of radius $(n(n-1)/R)^{1/2}$ if it satisfies conditions (C) and (1.10).*

Theorem III is due to Lichnerowicz [6] when condition (1.10) is replaced by the following one:

$$(1.14) \quad v \text{ is the gradient of a scalar function } f, \text{ i.e., } v_i = \nabla_i f.$$

For constant R , it is easily seen that condition (1.14) is a special case of condition (1.10). In fact, in this case by using (1.1) condition (1.10) becomes $\nabla_i v_j + \nabla_j v_i = 2\nabla_i \nabla_j f$, which is satisfied by $v_i = \nabla_i f + u_i$ where u_i is any vector field generating an infinitesimal isometry.

THEOREM IV. *A manifold M^n is isometric to an n -sphere if it satisfies condition (C), $L_a R = 0$, and*

$$(1.15) \quad A^a B^b = c = \text{const},$$

$$(1.16) \quad c \left(\frac{2a}{A} + \frac{(n-1)b}{B} \right) = \frac{2^a (a+b) R^{2(a+b-1)}}{n^{a+b-1} (n-1)^{a-1}},$$

where A, B are given by (1.8), and a, b are nonnegative integers and not both zero.

For constant R , Theorem IV is due to Lichnerowicz [6] for $a=0$, $b=1$ and due to Hsiung [2] for general a and b .

The following known theorems will be needed in the proofs of our Theorems I-IV.

THEOREM A (YANO AND NAGANO [11]). *If a complete Einstein space M^n of dimension $n > 2$ admits an infinitesimal nonisometric conformal transformation, then M^n is isometric to an n -sphere.*

THEOREM B (OBATA [7]). *If a complete Riemannian manifold M^n of dimension $n \geq 2$ admits a nonconstant function ρ such that $\nabla_i \nabla_j \rho = -c^2 \rho g_{ij}$, where c is a positive constant, then M^n is isometric to an n -sphere of radius $1/c$.*

THEOREM C (TASHIRO [8]). *If a complete Riemannian manifold M^n of dimension $n > 2$ admits a nonconstant function ρ such that*

$$(1.17) \quad \nabla_i \nabla_j \rho = -(1/n) g_{ij} \Delta \rho,$$

then M^n is conformal to an n -sphere.

THEOREM D (YANO [10]). *An orientable manifold M^n is conformal to an n -sphere if it satisfies condition (C) and*

$$(1.18) \quad (R_{ij} \rho^i \rho^j - (1/n(n-1)) R^2 \rho^2, 1) \geq 0.$$

2. Notation and formulas. In this section we shall list some known formulas (for the details of their derivations see Lichnerowicz' book [5, pp. 124–134] or Hsiung's paper [1]) which will be needed in the proofs to follow.

Let v be a vector field defining an infinitesimal conformal transformation on a Riemannian manifold M^n so that (1.1) holds. Then we have

$$(2.1) \quad \rho = -\delta v/n,$$

$$(2.2) \quad L_v R^h_{ijk} = -\varepsilon_k^h \nabla_i \rho_j + \varepsilon_j^h \nabla_i \rho_k - g_{ij} \nabla_k \nabla^h \rho + g_{ik} \nabla_j \nabla^h \rho,$$

where $\nabla^h = g^{ih} \nabla_i$, and $\varepsilon_k^h = 1$ for $h=k$ and $=0$ for $h \neq k$. From (1.1) and (2.2) it follows immediately that

$$(2.3) \quad L_v R_{hijk} = 2\rho R_{hijk} - g_{hk} \nabla_i \rho_j + g_{hj} \nabla_i \rho_k - g_{ij} \nabla_h \rho_k + g_{ik} \nabla_h \rho_j,$$

$$(2.4) \quad L_v R_{ij} = g_{ij} \Delta \rho - (n-2) \nabla_i \rho_j,$$

$$(2.5) \quad L_v R = 2(n-1) \Delta \rho - 2R\rho.$$

For any scalar field f and vector field u on M^n , we have

$$(2.6) \quad \Delta f = -\nabla^i \nabla_i f,$$

$$(2.7) \quad (\Delta u)_i = -\nabla^j \nabla_j u_i + \frac{1}{2} (Qu)_i,$$

where Q is the operator of Ricci defined by (1.13).

A necessary and sufficient condition for a vector field v to define an infinitesimal conformal transformation on a compact manifold M^n is that it satisfy

$$(2.8) \quad \Delta v + (1-2/n) d\delta v = Qv.$$

For an infinitesimal transformation v on a manifold M^n , we have

$$(2.9) \quad \Delta \delta v = (1/(n-1)) R \delta v - (n/2(n-1)) L_v R.$$

For any 1-form ξ on a compact orientable manifold M^n we have

$$(2.10) \quad (\Delta \xi + (1-2/n) d\delta \xi - Q\xi, \xi) \geq 0,$$

where the equality holds when and only when ξ defines an infinitesimal conformal transformation on M^n .

On the manifold M^n consider the following tensors:

$$(2.11) \quad T_{ij} = R_{ij} - (1/n)Rg_{ij},$$

$$(2.12) \quad T_{hijk} = R_{hijk} - (1/n(n-1))R(g_{ij}g_{hk} - g_{ik}g_{hj}),$$

$$(2.13) \quad \begin{aligned} W_{hijk} = & aT_{hijk} + b_1g_{hk}T_{ij} - b_2g_{hj}T_{ik} + b_3g_{ij}T_{hk} \\ & - b_4g_{ik}T_{hj} + b_5g_{hi}T_{jk} - b_6g_{jk}T_{hi}, \end{aligned}$$

where a and b are constants. It is easily seen that

$$(2.14) \quad g^{ij}T_{ij} = 0, \quad g^{hk}T_{hijk} = T_{ij}.$$

Moreover, by (1.3), (1.5) and (2.13) we have

$$(2.15) \quad \|W\| = a^2A + \frac{c-4a^2}{n-2}B - \frac{1}{n}\left(\frac{2a^2}{n-1} + \frac{c-4a^2}{n-2}\right)R^2,$$

where c is defined by (1.9).

3. Lemmas. Throughout this section M^n will always denote a compact orientable Riemannian manifold of dimension $n \geq 2$.

LEMMA 3.1. *If f is a scalar field on M^n and $\Delta f = 0$, then f is constant.*

Proof. From (2.6) and our assumption $\Delta f = 0$, it follows that $\Delta(f^2) = -\nabla^i \nabla_i(f^2) = -2(\nabla^i f)(\nabla_i f)$. By substituting $\nabla_i(f^2)$ for ξ_i in the well-known Green's formula

$$(3.1) \quad \int_{M^n} \nabla^i \xi_i dV = 0,$$

where ξ_i is any vector field on M^n , we therefore have

$$(3.2) \quad 0 = \int_{M^n} \Delta(f^2) dV = -2 \int_{M^n} (\nabla^i f)(\nabla_i f) dV,$$

which implies that $\nabla_i f = 0$ since $(\nabla^i f)(\nabla_i f)$ is nonnegative.

LEMMA 3.2. *For an orientable M^n satisfying $L_{a\rho}R = 0$ and (C) defined in §1, we have*

$$(3.3) \quad (R^{ij}\nabla_i\nabla_j\rho + R^2\rho/n(n-1), \rho) \geq 0.$$

For constant R , Lemma 3.2 is due to Lichnerowicz [6].

Proof. By applying the integral formula (2.10) to the 1-form $d\rho$ we have

$$(3.4) \quad ((2(n-1)/n)\Delta d\rho - Qd\rho, d\rho) \geq 0.$$

On the other hand, covariant differentiation gives

$$(3.5) \quad \begin{aligned} & \nabla^i[\rho((2(n-1)/n)\Delta d\rho - Qd\rho)_i] \\ & = \langle (2(n-1)/n)\Delta d\rho - Qd\rho, d\rho \rangle - \langle (2(n-1)/n)\Delta d\rho - \delta Qd\rho, \rho \rangle. \end{aligned}$$

From (3.4), (3.5) and Green's formula (3.1) we thus obtain

$$(3.6) \quad ((2(n-1)/n)\Delta\Delta\rho - \delta Q d\rho, \rho) \geq 0.$$

Due to the assumption $L_v R = 0$, (2.5) is reduced to

$$(3.7) \quad \Delta\rho = R\rho/(n-1).$$

Since $L_{d\rho} R = 0$ implies

$$(3.8) \quad \rho^i \nabla_i R = 0,$$

substitution of $\rho^2 \nabla_i R$ for ξ_i in Green's formula (3.1) gives

$$(3.9) \quad (\rho \Delta R, \rho) = 0.$$

On the other hand, by the second Bianchi identity we have

$$(3.10) \quad \nabla^j R_{ij} = \frac{1}{2} \nabla_i R,$$

which together with (3.8) implies

$$(3.11) \quad \rho^i \nabla^j R_{ij} = 0.$$

From (1.13), (3.11) and (3.7) follow immediately

$$(3.12) \quad \delta Q d\rho = -2 \nabla_i (R^{ij} \rho_j) = -2 R^{ij} \nabla_i \rho_j,$$

$$(3.13) \quad \Delta\Delta\rho = (1/(n-1)^2) R^2 \rho + (1/(n-1)) \rho \Delta R.$$

Substituting (3.12), (3.13) in (3.6) and making use of (3.9), we hence obtain the required inequality (3.3).

4. Proofs of theorems.

Proof of Theorem I. From (2.13) and the condition $L_v R = 0$ it follows that

$$(4.1) \quad L_v \|W\| = L_v \left(a^2 A + \frac{c-4a^2}{n-2} B \right).$$

By means of (2.13), (2.12), (1.1), (2.3), (2.4), (3.7) we can easily compute $L_v W_{hijk}$ (for the details see [3, p. 189]), and then multiplying both sides of the resulting expression by W^{hijk} and making use of (2.13), (2.12), (1.1), (2.15), (1.9) and $R^i_{ijk} = 0$ an elementary but lengthy calculation yields

$$(4.2) \quad W^{hijk} L_v W_{hijk} = 2\rho \|W\| - c T^{ij} \nabla_i \rho_j.$$

Substitution of (4.2) in the well-known formula

$$(4.3) \quad L_v \|W\| = 2 W^{hijk} L_v W_{hijk} - 8\rho \|W\|$$

thus gives

$$(4.4) \quad \rho L_v \|W\| = -4\rho^2 \|W\| - 2c\rho T^{ij} \nabla_i \rho_j.$$

A straightforward computation and use of (2.6), (3.7), (2.11), (3.10) can easily show that

$$(4.5) \quad \nabla^i(R\rho\rho_i) = (\nabla_i R)\rho\rho^i + R\rho_i\rho^i - R^2\rho^2/(n-1),$$

$$(4.6) \quad \nabla^i(T_{ij}\rho\rho^j) = R_{ij}\rho^i\rho^j + \rho T^{ij}\nabla_i\rho_j + ((n-2)/2n)(\nabla_i R)\rho\rho^i - (1/n)R\rho_i\rho^i.$$

By substituting (4.5) for $(\nabla_i R)\rho\rho^i$ and (4.4) for $\rho T^{ij}\nabla_i\rho_j$ in (4.6), integrating over M^n and making use of (3.1), we thus obtain

$$(4.7) \quad \begin{aligned} & 2c(R_{ij}\rho^i\rho^j - (1/n(n-1))R^2\rho^2, 1) \\ & = 4(\|W\|, \rho^2) + (L_v\|W\|, \rho) + c(\rho_i\rho^i - (1/(n-1))R\rho^2, R). \end{aligned}$$

Since $(\|W\|, \rho^2)$ is nonnegative, from (4.7), (4.1) and our assumption (1.6), (1.7) we obtain (1.18). Hence by Theorem D, M^n is conformal to an n -sphere.

Proof of Theorem II. First suppose (1.10) holds. Then from (1.10), (2.6) it follows that $\Delta(Rf) = -nR\rho$, implying, together with (3.7), that

$$(4.8) \quad \Delta(\rho + (1/n(n-1))Rf) = 0.$$

Thus by Lemma 3.1, $\rho + (1/n(n-1))Rf$ is a constant. Using (1.10), (3.7) we therefore obtain

$$\nabla_i\rho_j = -(1/n(n-1))\nabla_i\nabla_j(Rf) = -(1/n)g_{ij}\Delta\rho.$$

Hence by Theorem C, M^n is conformal to an n -sphere.

Next suppose (1.11) holds. From the definition of Δ it follows that

$$(4.9) \quad d\Delta\rho = \Delta d\rho,$$

which, together with (3.7) and the first equation of (1.11), implies

$$(4.10) \quad \Delta d\rho + (1-2/n)d\delta d\rho - Qd\rho = 0.$$

Thus by the necessary and sufficient condition (2.8) we see that $d\rho$ generates an infinitesimal conformal transformation on M^n so that $L_{d\rho}g_{ij} = 2\phi g_{ij}$, which shows

$$(4.11) \quad \nabla_i\rho_j = \phi g_{ij},$$

where $\phi \neq 0$ in consequence of (3.7). From (4.11) and the second equation of (1.11) it follows that

$$(4.12) \quad \nabla_i\nabla_j(R\rho) = R\phi g_{ij}.$$

Thus the condition (1.10) is satisfied for $v = d\rho$ and $f = \rho$, and hence M^n is conformal to an n -sphere.

Finally suppose (1.12) holds. Then (2.4) becomes

$$(4.13) \quad \alpha g_{ij} = g_{ij}\Delta\rho - (n-2)\nabla_i\rho_j.$$

Multiplying (4.13) by g^{ij} and using (3.7) we obtain

$$(4.14) \quad \alpha = (2/n)R\rho.$$

Substitution of (4.14), (3.7) in (4.13) thus gives (1.17), and hence Theorem C completes the proof of our theorem.

Proof of Theorem III. It is exactly the same as that of Theorem II for condition (1.10) except that the application of Theorem C should be replaced by that of Theorem B.

Proof of Theorem IV. Without loss of generality we may assume our manifold M^n to be orientable as otherwise we need only to take an orientable twofold covering space of M^n . On the manifold M^n consider the covariant tensor field T of order $2(2a+b)$:

$$(4.15) \quad T_{h_1 i_1 j_1 k_1 \dots h_a i_a j_a k_a u_1 v_1 \dots u_b v_b} = \prod_{r=1}^a R_{h_r i_r j_r k_r} \prod_{s=1}^b R_{u_s v_s} - \frac{R^{a+b}}{n^{a+b}(n-1)^a} \prod_{r=1}^a (g_{i_r j_r} g_{h_r k_r} - g_{i_r k_r} g_{h_r j_r}) \prod_{s=1}^b g_{u_s v_s}.$$

From (4.15) an elementary calculation gives the length of T :

$$(4.16) \quad [2(2a+b)]! \langle T, T \rangle = A^a B^b - 2^a R^{2(a+b)} / n^{a+b} (n-1)^a.$$

Thus by condition (1.15), $L_v R = 0$ and the extension of formula (4.3) to the tensor T we immediately obtain

$$(4.17) \quad L_v \langle T, T \rangle = 2 \langle L_v T, T \rangle - 4(2a+b) \rho \langle T, T \rangle = 0,$$

which implies

$$(4.18) \quad (\langle L_v T, T \rangle, \rho) = 2(2a+b)(\rho \langle T, T \rangle, \rho).$$

On the other hand, from (2.3), (2.4) we obtain

$$(4.19) \quad \begin{aligned} L_v T_{h_1 i_1 j_1 k_1 \dots h_a i_a j_a k_a u_1 v_1 \dots u_b v_b} &= 2a \rho \prod_{r=1}^a R_{h_r i_r j_r k_r} \prod_{s=1}^b R_{u_s v_s} \\ &\quad - \sum_{r=1}^a [R_{h_1 i_1 j_1 k_1} \dots R_{h_{r-1} i_{r-1} j_{r-1} k_{r-1}} \\ &\quad \cdot (g_{h_r k_r} \nabla_{i_r} \nabla_{j_r} \rho - g_{h_r j_r} \nabla_{i_r} \nabla_{k_r} \rho + g_{i_r j_r} \nabla_{k_r} \nabla_{h_r} \rho - g_{i_r k_r} \nabla_{j_r} \nabla_{h_r} \rho) \\ &\quad \cdot R_{h_{r+1} i_{r+1} j_{r+1} k_{r+1}} \dots R_{h_a i_a j_a k_a}] \prod_{s=1}^b R_{u_s v_s} \\ &\quad + \prod_{r=1}^a R_{h_r i_r j_r k_r} \sum_{s=1}^b \{ R_{u_1 v_1} \dots R_{u_{s-1} v_{s-1}} \\ &\quad \cdot [g_{u_s v_s} \Delta \rho - (n-2) \nabla_{v_s} \nabla_{u_s} \rho] \cdot R_{u_{s+1} v_{s+1}} \dots R_{u_b v_b} \} \\ &\quad - \frac{2(2a+b)R^{a+b}}{n^{a+b}(n-1)^a} \rho \prod_{r=1}^a (g_{i_r j_r} g_{h_r k_r} - g_{i_r k_r} g_{h_r j_r}) \prod_{s=1}^b g_{u_s v_s}. \end{aligned}$$

By means of (4.15), (4.19), (3.7), (1.16), (1.8), (4.16) an elementary calculation yields

$$(4.20) \quad \begin{aligned} (\langle L_v T, T \rangle, \rho) &= 2a(\rho \langle T, T \rangle, \rho) \\ &\quad - \frac{A^a B^b}{[2(2a+b)]!} \left(\frac{4a}{A} + \frac{(n-2)b}{B} \right) \left(R^{jk} \nabla_j \nabla_k \rho + \frac{R^2 \rho}{n(n-1)}, \rho \right). \end{aligned}$$

By comparing (4.18) and (4.20), noticing that $\rho \neq 0$, and making use of Lemma 3.2, we thus have

$$(4.21) \quad T_{h_1 i_1 j_1 k_1 \dots h_a i_a j_a k_a u_1 v_1 \dots u_b v_b} = 0.$$

Multiplying (4.21) by

$$g^{h_1 k_1} \prod_{r=2}^a g^{h_r k_r} g^{i_r j_r} \prod_{s=1}^b g^{u_s v_s},$$

and using (4.15) we obtain $R_{i_1 j_1} = R g_{i_1 j_1} / n$, which implies M^n is an Einstein space. Hence, by Theorem A, M^n is isometric to an n -sphere, and our theorem is proved.
