GROUPS OF PL Λ -HOMOLOGY SPHERES

BY

GERALD A. ANDERSON¹

ABSTRACT. Let $\Lambda = \mathbf{Z}_K$ be a subring of $\mathbf{Q}$. The group of H_K -cobordism classes of closed PL n -manifolds with the Λ -homology of S^n is computed for $n > 4$ (modulo K -torsion). The simply connected version is also computed.

1. Introduction. Let K be a set of primes and $\Lambda = \mathbf{Z}[1/p: p \in K]$ the localization of the integers away from K . This paper is devoted to the computation of the groups ψ_n^K of piecewise-linear Λ -homology n -spheres, modulo H_K -cobordism.

In their classic paper [12], Kervaire and Milnor computed the group of h -cobordism classes of smooth homotopy spheres. This was generalized to homology spheres by Kervaire [11]. In two independent contributions, the group of H_K -cobordism classes of smooth Λ -homology spheres was computed by Alexander, Hamrick and Vick [1], in the case $K = \{\text{odd primes}\}$ and by Barge, Lannes, Latour and Vogel [5] in the arbitrary case.

In §2, we define ψ_n^K and the corresponding group θ_n^K of Λ -homotopy spheres, requiring Λ -homology spheres and H_K -cobordisms to be simply connected. We show that if $2 \notin K$, then $\theta_4^K = \psi_4^K = 0$ and $\theta_n^K \cong \psi_n^K$ if $n \geq 5$.

In §3, we construct an embedding $L_{n+1}(1; \Lambda)/L_{n+1}(1) \rightarrow \theta_n^K$ (or ψ_n^K) and prove

$$\psi_n^K \otimes \Lambda \cong (L_{n+1}(1; \Lambda)/L_{n+1}(1)) \otimes \Lambda \quad \text{for } n \geq 5.$$

We then show that every Λ -homology sphere is stably K -parallelizable. This is done by computing the mod(K) homotopy groups of the fiber of $B\tilde{\text{PL}} \rightarrow BH(K)$, where $H(K)$ is the structure monoid of Λ -homology cobordism bundles.

In §4, we prove our main result: If $n \geq 4$, $2 \notin K$, then

$$\theta_n^K = \begin{cases} 0, & n \not\equiv 3 \pmod{4}, \\ \overline{W}(\Lambda, \mathbf{Z}) \oplus \bigoplus_{\pi(k)-1} \Lambda/\mathbf{Z}, & n = 4k - 1, \end{cases}$$

modulo the Serre class of finite K -torsion groups.

Three dimensional Λ -homology spheres are considered in §5. We construct elements of ψ_3^K corresponding to the mod(K) surgery obstructions as above, and exhibit an epimorphism $\alpha_K: \psi_3^K \rightarrow \mathbb{Z}/(16/a_K)\mathbb{Z}$. Finally, we compute the fundamental groups of these manifolds.

2. Groups of homotopy and homology spheres. Let $H = \text{DIFF}$, PL or TOP . A closed H n -manifold Σ is an H Λ -homology sphere if $H_*(\Sigma; \Lambda) \cong H_*(S^n; \Lambda)$. Note that Σ is orientable since $H_n(\Sigma) \otimes \Lambda = \Lambda$. An H Λ -homology sphere Σ is an H Λ -homotopy sphere if $\pi_1(\Sigma) = 0$.

A cobordism $(W; M, M')$ is an H_K -cobordism if $H_*(W, M; \Lambda) = 0$; an H_K -cobordism is an h_K -cobordism if, in addition, $\pi_1(M) \cong \pi_1(W) \cong \pi_1(M')$.

Let $\psi_n^K(H)$ be the set of H_K -cobordism classes of oriented H Λ -homology n -spheres, and $\theta_n^K(H)$ the set of h_K -cobordism classes of oriented H Λ -homotopy n -spheres. Both $\psi_n^K(H)$ and $\theta_n^K(H)$ are abelian groups under the operation of connected sum. There is clearly a homomorphism $\theta_n^K(H) \rightarrow \psi_n^K(H)$. We let $\theta_n^K = \theta_n^K(\text{PL})$, $\psi_n^K = \psi_n^K(\text{PL})$.

An oriented H -manifold M is stably K -parallelizable if the map

$$M \xrightarrow{\nu_M} BSH \rightarrow (BSH)_K$$

is null-homotopic. We have the following mild generalization of Lemma 1.1 of [1]:

LEMMA 2.1. *Let Σ be a smooth Λ -homology sphere. Then Σ is stably K -parallelizable.*

The proof is immediate from [1]. Compare [12, Theorem 3.1], and [11, Theorem 3].

PROPOSITION 2.2. *Suppose π is a finitely presented group so that $H_1(\pi; \Lambda) = H_2(\pi; \Lambda) = 0$. Then for $n \geq 5$, there is a smooth Λ -homology sphere Σ^n with $\pi_1(\Sigma) = \pi$.*

PROOF. Suppose M is a smooth manifold. Then

$$\begin{aligned} H_2(\pi_1(M); \Lambda) &\cong H_2(\pi_1(M)) \otimes \Lambda \quad \text{by the universal coefficient} \\ &\quad \text{theorem, since } \Lambda \text{ is torsion free} \\ &\cong (H_2(M)/\text{Im}(h)) \otimes \Lambda \quad \text{where } h \text{ is the Hurewicz} \\ &\quad \text{homomorphism, by [8]} \\ &\cong H_2(M; \Lambda)/\text{Im}(h_K), \quad h_K \text{ the composition} \\ &\quad \pi_2(M) \xrightarrow{h} H_2(M) \rightarrow H_2(M; \Lambda). \end{aligned}$$

The result now follows exactly as in [11, Theorem 1].

Our main result of this section is

THEOREM 2.3. *Suppose $2 \notin K$. Then:*

- (i) $\theta_n^K \cong \psi_n^K$ for $n \geq 5$;
- (ii) $\theta_4^K = \psi_4^K = 0$.

PROOF. We prove (ii) first. Let Σ^4 be a PL Λ -homology sphere. By [9], Σ is smoothable. Furthermore, Σ has trivial normal bundle, since $H_2(\Sigma; \mathbb{Z}/2\mathbb{Z}) = H_3(\Sigma; \mathbb{Z}/2\mathbb{Z}) = 0$, and the obstruction in $H^4(\Sigma; \mathbb{Z})$ is given by a multiple of $p_1(\Sigma) = 3 \text{ Sign}(\Sigma) = 0$. Thus Σ bounds a parallelizable manifold, since $\Omega_4^{\text{fr}} = 0$. Since $L_5(1; \Lambda) = 0$, by [3] $\theta_4^K = 0$. To see that $\psi_4^K = 0$, let $\mathcal{F}: \Lambda[\pi_1(\Sigma)] \rightarrow \Lambda$ be the coefficient homomorphism and $\Gamma_5(\mathcal{F})$ the surgery obstruction group of [7]. By [7], $\Gamma_5(\mathcal{F}) = 0$, and Σ bounds a Λ -acyclic manifold.

To prove (i) assume $n \geq 5$ and Σ^n is a smooth Λ -homology sphere. By Lemma 2.1, Σ is stably K -parallelizable, and so $T_\Sigma \in KO(\Sigma)$ has order in Λ . Let $\alpha_1, \dots, \alpha_m$ be generators for $\pi_1(\Sigma)$, represented by disjoint embeddings $\phi_i: S^1 \rightarrow \Sigma$. Then $\phi_i^*(T_\Sigma) \in KO(S^1) = \mathbb{Z}/2\mathbb{Z}$ has odd order, and so the normal bundle of ϕ_i is trivial. Attach handles along $\text{Im}(\phi_i)$; let N be the trace of these surgeries.

Both N and $\Sigma' = \partial_+ N$ are stably K -parallelizable, and

$$\pi_1(\Sigma') = 0, \quad H_i(\Sigma'; \Lambda) = 0, \quad 3 \leq i \leq n-3,$$

and $H_2(\Sigma'; \Lambda)$, $H_{n-2}(\Sigma'; \Lambda)$ are free Λ -modules of rank m . Do surgery on a basis for $H_2(\Sigma'; \Lambda)$; the resultant is a Λ -homotopy sphere which is H_K -cobordant to Σ .

Now, if Σ is not smooth, then Σ admits a smoothing in a neighborhood of its 2-skeleton, and the argument goes through as above.

Suppose finally that Σ is a Λ -homotopy sphere and W is an H_K -cobordism to S^n . Then W is stably K -parallelizable and we may do surgery on a set of generators of $\pi_1(W) \cong \pi_1(W, \Sigma)$. Let W' be the resultant. Then the result of doing surgery on a basis for $H_2(W', \Sigma; \Lambda)$ gives an H_K -cobordism between Σ and S^n .

3. Stable K -parallelizability and $\psi_n^K \otimes \Lambda$. Recall that the simply connected surgery obstruction groups with coefficients in Λ , as computed in [3], [4], are given by

$$L_n(1; \Lambda) = \begin{cases} 0, & n \text{ odd}, \\ (\mathbb{Z}/2\mathbb{Z}) \otimes \Lambda, & n \equiv 2 \pmod{4}, \\ \overline{W}(\Lambda), & n \equiv 0 \pmod{4}, \end{cases}$$

where $\overline{W}(\Lambda) \subseteq \mathbb{Z} \oplus \bigoplus_{p \in K} W(\mathbb{F}_p)$ is the Witt-Wall group of even quadratic forms over Λ , modulo kernels, and

$$W(\mathbf{F}_p) = \begin{cases} \mathbf{Z}/4\mathbf{Z}, & p \equiv 3 \pmod{4}, \\ \mathbf{Z}/2\mathbf{Z} \oplus \mathbf{Z}/2\mathbf{Z}, & p \equiv 1 \pmod{4}, \\ \mathbf{Z}/2\mathbf{Z}, & p = 2. \end{cases}$$

The embedding above is given by $(1/a_K)\text{Sign}$ and the Hasse-Minkowski invariants $\beta_p: W(\mathbf{Q}) \rightarrow W(\mathbf{F}_p)$, where

$$a_K = \begin{cases} 1, & K \equiv 0 \pmod{2}, \\ 2, & K \equiv 3 \pmod{4}, K \not\equiv 0 \pmod{2}, \\ 4, & K \neq \emptyset, K \not\equiv 3 \pmod{4}, K \not\equiv 0 \pmod{2}, \\ 8, & K = \emptyset. \end{cases}$$

(We write $K \equiv a \pmod{b}$ if $p \equiv a \pmod{b}$ for some $p \in K$.)

We have the following result from [3].

PROPOSITION 3.1. *Let $x \in \overline{W}(\Lambda)$ and $k > 1$. Then there is a smooth manifold triad $(M; \partial_+ M, \partial_- M)$ and a normal map $\phi: (M; \partial_+ M, \partial_- M) \rightarrow (S^{4k-1} \times I; S^{4k-1} \times 0, S^{4k-1} \times 1)$ so that*

- (i) $\phi|_{\partial_+ M}$ is the identity,
- (ii) $\pi_1(\partial_- M) = 0$ and $\phi|_{\partial_- M}$ induces isomorphisms on Λ -homology, and
- (iii) the cup product pairing of M is equivalent to x in $\overline{W}(\Lambda)$.

We let $\Sigma_x = \partial_- M$ and $M_x = M \cup c(\partial_+ M) \cup c(\partial_- M)$; Σ_x is a smooth Λ -homotopy $(4k - 1)$ -sphere and M_x is a closed Λ -homology manifold.

Let $\Omega_n^{G,K}$ be the cobordism group of oriented Λ -Poincaré complexes, and $MSG(K)$ the Thom spectrum associated to Λ -spherical fibrations [19]. Since closed Λ -homology manifolds satisfy Poincaré duality with Λ -coefficients, the spaces M_x generate a subgroup A_{4k} of $\Omega_n^{G,K}$. Let $A_{2n+1} = 0$ and $A_{4k+2} = (\mathbf{Z}/2\mathbf{Z}) \otimes \Lambda$.

PROPOSITION 3.2. *$A_{4k} \cong \overline{W}(\Lambda)$ and for $n \geq 5$, there is an exact sequence*

$$0 \rightarrow A_n \rightarrow \Omega_n^{G,K} \rightarrow \pi_n(MSG(K)) \rightarrow 0.$$

PROOF. Define $f: \overline{W}(\Lambda) \rightarrow A_{4k}$ by $f(x) = [M_x]$. By an elementary surgery argument, f is a homomorphism, which is clearly surjective. Furthermore, if M_x is a boundary, then the standard argument (e.g. [6, Theorem III.2.4]) shows that x is a kernel, so that f is injective. The second statement is immediate from [10, §7.11].

Let $\overline{W}(\Lambda, \mathbf{Z}) = \text{coker}(\overline{W}(\mathbf{Z}) \rightarrow \overline{W}(\Lambda))$.

PROPOSITION 3.3. *There is an embedding $\overline{W}(\Lambda, \mathbf{Z}) \rightarrow \theta_{4k-1}^K$, $k > 1$.*

PROOF. Define $r: \overline{W}(\Lambda) \rightarrow \theta_{4k-1}^K$ by $r(x) = [\Sigma_x]$. Surgery arguments show that r is a well-defined homomorphism. Suppose $r(x) = 0$. Then there is an

h_K -cobordism W from Σ_x to S^{4k-1} . Furthermore, the quadratic form on $H^{2k}(N_x; Q)$ represents x , where $N_x = D^{4k} \cup M \cup W \cup D^{4k}$ and M is the manifold of Proposition 3.1 associated to x . Since N_x is a closed manifold, $x \in \overline{W}(Z)$.

REMARK. The same proof shows that $\overline{W}(\Lambda, Z)$ embeds in ψ_{4k-1}^K , $k > 1$.

PROPOSITION 3.4. *Let Σ^n be a stably parallelizable Λ -homotopy sphere, $n \geq 4$. Then $[\Sigma] = 0$ in θ_n^K if $n \not\equiv 3 \pmod{4}$, and is h_K -cobordant to some Σ_x otherwise.*

PROOF. Let $f: \Sigma \rightarrow S^n$ collapse the exterior of a disc to a point. Then f and 1_{S^n} determine the same PL-normal invariant, and so are normally cobordant, by, say, $F: W \rightarrow S^n \times I$. By adding a certain manifold M , as constructed above, to W , we may assume the surgery obstruction of F vanishes, so that Σ is h_K -cobordant to ∂M . Clearly $\partial M = S^{n-1}$ if $n \not\equiv 3 \pmod{4}$ and some Σ_x otherwise.

The following is implicit in Quinn [16].

THEOREM 3.5. *For $n \geq 5$, $\psi_n^K \otimes \Lambda \cong (L_{n+1}(1; \Lambda)/L_{n+1}(1)) \otimes \Lambda$.*

PROOF. We sketch the proof. Let $\mathcal{S}_{\text{PL}}^K(S^n)$ be the set of Λ -homology triangulations of S^n , i.e., degree 1 Λ -homology equivalences $f: M^n \rightarrow S^n$ modulo H_K -cobordisms. Define $\phi: \psi_n^K \rightarrow \mathcal{S}_{\text{PL}}^K(S^n)$ by sending Σ to the map $\Sigma \rightarrow S^n$, collapsing the exterior of an embedded n -disc to a point. (If W is an H_K -cobordism between Σ and Σ' , then collapsing the exterior of a regular neighborhood of an embedded path between Σ and Σ' shows that ϕ is well defined.) ϕ is a clearly a bijection.

Let $\mathcal{U}_{\text{PL}}^K(S^n)$ be the set of K -normal invariants of S^n , cobordism classes of degree 1 mappings $f: M^n \rightarrow S^n$ together with a factorization

$$\begin{array}{ccc} M & \xrightarrow{\nu_M} & (BSPL)_K \\ f \downarrow & \nearrow & \\ S^n & & \end{array}$$

By [16], there are exact sequences for $n \geq 5$,

$$\begin{aligned} \cdots &\rightarrow L_{n+1}(1; \Lambda) \rightarrow \mathcal{S}_{\text{PL}}^K(S^n) \rightarrow \mathcal{U}_{\text{PL}}^K(S^n) \rightarrow L_n(1; \Lambda), \\ \cdots &\rightarrow \Omega_n^K \rightarrow \mathcal{U}_{\text{PL}}^K(S^n) \rightarrow \pi_n(G/\text{PL}) \otimes \Lambda \rightarrow \Omega_{n-1}^K \rightarrow \cdots, \end{aligned}$$

where $\Omega_n^K = \pi_n^S(MSPL^{(K)})$, and $MSPL^{(K)}$ is the fiber of $MSPL \rightarrow (MSPL)_K$. Since $\Omega_n^K \otimes \Lambda = 0$, and $\pi_n(G/\text{PL}) = L_n(1)$ for $n \geq 5$, the result follows.

To prove that PL Λ -homology spheres are stably K -parallelizable, we introduce Λ -homology cobordism bundles.

A polyhedron M is called a Λ -homology manifold of dimension n if M has a

subdivision M' so that $\tilde{H}_*(Lk(x, M'); \Lambda) \cong \tilde{H}_*(S^{n-1}; \Lambda)$ or 0. The *boundary* of M ,

$$\partial M = \{x \in M': \tilde{H}_*(Lk(x, M'); \Lambda) = 0\}$$

is a Λ -homology manifold of dimension $n - 1$.

A Λ -homology n -sphere is a Λ -homology n -manifold Σ so that $H_*(\Sigma; \Lambda) \cong H_*(S^n; \Lambda)$; a Λ -homology n -disc is a compact Λ -acyclic Λ -homology n -manifold Δ . The prefix "PL" indicates that Σ or Δ is a PL manifold. A Λ n -cell is the cone cM over a Λ -homology $(n - 1)$ -sphere or $(n - 1)$ -disc M ; such a Λ n -cell is a Λ -homology n -manifold with boundary M or $M \cup c(\partial M)$. An H_K -cobordism is a Λ -homology manifold triad $(W; M_+, M_-)$ with $H_*(W; M_\pm; \Lambda) = 0$. (Again the prefix "PL" means that W is a PL-manifold.)

A Λ -cell decomposition of a simplicial complex X is a collection $\mathcal{O}$ of subpolyhedra of X so that

(i) each $\Delta \in \mathcal{O}$ is a Λ -cell,

(ii) X has a subdivision X' so that every simplex of X' lies in the interior of a unique element of $\mathcal{O}$, and

(iii) if $\Delta \in \mathcal{O}$, $\partial\Delta$ is a union of elements of $\mathcal{O}$.

Let X be a simplicial complex with a Λ -cell decomposition $\mathcal{O}$. A Λ -homology cobordism (n -sphere) bundle ξ over X is a complex $E = E(\xi)$ over $\mathcal{O}$ (see [15, p. 96]) so that for each $\Delta^m \in \mathcal{O}$:

(i) $E(\Delta)$ is a Λ -homology $(n + m)$ -manifold with

$$\partial E(\Delta) = E(\partial\Delta) = \bigcup_{\substack{\Delta_0 \in \mathcal{O}|\Delta \\ \Delta_0 \neq \Delta}} E(\Delta_0),$$

and

(ii) there is a complex W over $\mathcal{O}|\Delta$ so that $W(\Delta_0)$ is an H_K -cobordism between $E(\Delta_0)$ and $\Delta_0 \times S^n$ for each $\Delta_0 \in \mathcal{O}|\Delta$.

Here $\mathcal{O}|\Delta$ denotes the Λ -cell decomposition of Δ consisting of those $\Delta_0 \in \mathcal{O}$ with $\Delta_0 \subset \Delta$.

Two Λ -homology cobordism bundles ξ^n, η^n over X are *isomorphic*, written, $\xi \cong \eta$, if there is a complex G over $\mathcal{O}$ so that for each $\Delta \in \mathcal{O}$, $G(\Delta)$ is an H_K -cobordism between $E(\xi)(\Delta)$ and $E(\eta)(\Delta)$.

These bundles satisfy the analogous properties that the homology cobordism bundles of [15] enjoys. In particular, isomorphism classes on Λ -homology cobordism n -sphere bundles are classified by $BH(K)_{n+1}$, where $H(K)_{n+1}$ is the Δ -monoid with i -simplexes given by isomorphisms of the trivial bundle $\Delta^i \times S^n$ over Δ^i . There are stabilization maps $BH(K)_n \rightarrow BH(K)_{n+1}$ and we let $BH(K) = \lim BH(K)_n$.

Let $\overline{PL}_n$ be the Δ -set with i -simplexes PL n -block bundles over $\Delta^i \times I$ which are trivial over $\Delta^i \times \dot{I}$. Then $\overline{PL}_n$ and PL_n are homotopy equivalent

(see [14]), and $\overline{\text{PL}}_n \subset H(K)_n$. Therefore there is a natural map $B\widetilde{\text{PL}} \rightarrow BH(K)$, with fiber denoted by $H(K)/\widetilde{\text{PL}}$.

THEOREM 3.6. $\pi_n(H(K)/\widetilde{\text{PL}}) \otimes \Lambda \cong \psi_n^K \otimes \Lambda$.

THE PROOF. The proof is immediate from the following two lemmas. Recall from [18] that a Λ -acyclic resolution $f: N^n \rightarrow M^n$ between Λ -homology manifolds is a proper, PL surjection so that $\tilde{H}_*(f^{-1}(x); \Lambda) = 0$ for every $x \in M$, and $f|_{\partial N}: \partial N \rightarrow \partial M$ is also a Λ -acyclic resolution, and that if M is orientable and ∂M is a PL-manifold, then there is a Λ -acyclic resolution, $\text{rel}(\partial M)$, to a PL-manifold N provided obstructions $\mu_j \in H_j(M; \psi_{n-j-1}^K)$, $j = n-1, \dots, 0$, vanish.

Let $\text{PLH}(K)_n$ be the Λ -set of which a typical i -simplex is a block-preserving PL H_K -cobordism between $\Delta^i \times S^{n-1}$ and itself. We have $\overline{\text{PL}}_n \subset \text{PLH}(K)_n \subset H(K)_n$.

LEMMA 3.7. $\pi_n(H(K)/\text{PLH}(K)) \otimes \Lambda \cong \psi_n^K \otimes \Lambda$.

PROOF. Let $x \in \pi_n(H(K)_i/\text{PLH}(K)_i)$. Then x is represented by a Λ -homology cobordism i -sphere bundle W over $\Delta^n \times I$, trivial over $\Delta^n \times \dot{I}$, and a PL H_K -cobordism over $\Delta^{n-1} \times I$; W is a Λ -homology $(n+i+1)$ -manifold with PL boundary, and $H_*(W; \Lambda) \cong H_*(S^i; \Lambda)$.

Let $\mu_j(x) \in H_j(W; \psi_{n+i-j}^K)$ be the first nonzero obstruction to resolving $W \text{ rel}(\partial W)$. If $j > i$, then $k\mu_j(x) = 0$ for some $k \in \Lambda$, and by naturality of the obstructions, $\mu_j(kx) = 0$. Continuing in this way, there are two obstructions $\mu_i \in \psi_n^K \otimes \Lambda$, $\mu_0 \in \psi_{n+i}^K \otimes \Lambda$ to resolving an isomorphism representing kx for some $k \in \Lambda$.

Define $\phi_i: \pi_n(H(K)_i/\text{PLH}(K)_i) \otimes \Lambda \rightarrow \psi_n^K \otimes \Lambda$ by $\phi_i(x) = k^{-1}\mu_i(kx)$, where k is chosen as above. It follows easily that ϕ_i is a well-defined homomorphism and that

$$\begin{array}{ccc} \pi_n(H(K)_i/\text{PLH}(K)_i) \otimes \Lambda & \xrightarrow{\phi_i} & \psi_n^K \otimes \Lambda \\ \downarrow & & \downarrow = \\ \pi_n(H(K)_{i+1}/\text{PLH}(K)_{i+1}) \otimes \Lambda & \xrightarrow{\phi_{i+1}} & \psi_n^K \otimes \Lambda \end{array}$$

commutes. Define

$$\phi = \lim \phi_i: \pi_n(H(K)/\text{PLH}(K)) \otimes \Lambda \rightarrow \psi_n^K \otimes \Lambda.$$

To see that ϕ is injective, let $x \in \ker(\phi)$, and represent kx by a Λ -homology cobordism i -sphere bundle with $n+i \not\equiv 3 \pmod{4}$ and $\mu_j(kx) = 0$ for $j > i$. Then $\phi(x) = k^{-1}\mu_i(kx) = 0$, so that $\mu_i(kx)$ is K -torsion. Since $n+i \not\equiv 3 \pmod{4}$, $\psi_{n+i}^K \otimes \Lambda = 0$ by Theorem 3.5, and so all obstructions $\mu_i, \mu_{i-1}, \dots, \mu_0$ are K -torsion. As above, there exists $k' \in \Lambda$ so that $k'kx$ is represented by a bundle W with all obstructions to resolving $W \text{ rel}(\partial W)$ vanishing. Thus there is a PL-manifold V and a Λ -acyclic resolution $f:$

$V \rightarrow W$, identity on the boundary. But V represents 0 in $\pi_n(H(K)_i/PLH(K)_i)$, and the mapping cylinder of f represents a homotopy from $k'kx$ to V . Therefore $x = 0$.

Finally, ϕ is surjective: Let $y \in \psi_n^K \otimes \Lambda$ and Σ^n a PL Λ -homology sphere representing ky for some $k \in \Lambda$. By choosing an embedded n -disc in Σ , we can regard $c\Sigma$ as a space over $\Delta^n \times I$, as in [14], and $c\Sigma \times S^i$ represents an element $x \in \pi_n(H(K)_i/PLH(K)_i)$ with a single resolution obstruction $\mu_j(x) = [\Sigma]$. Then $\phi(x/k) = y$.

LEMMA 3.8. $\pi_n(PLH(K)/\overline{PL}) \otimes \Lambda = 0$.

PROOF. Let $x \in \pi_n(PLH(K)/\overline{PL})$ be represented by a PL H_K -cobordism W of $\Delta^n \times S^i$ that is a PL block bundle over $\Delta^n \times I$ and the product bundle over $\Delta^{n-1} \times I$, with $n + i \not\equiv 2 \pmod{4}$. Extend $W|\partial(\Delta^n \times I)$ to a disc bundle V , and let $\Sigma = W \cup V$. Then Σ is a PL Λ -homology $(n + i + 1)$ -sphere, and by Theorem 3.5, $\#_k \Sigma$ bounds a Λ -acyclic manifold H for some $k \in \Lambda$. By replacing x by kx , we may assume $W \cup V$ bounds a Λ -acyclic manifold H ; by Corollary 3.3 of [5] we may further assume that $\pi_1(H) = 0$.

Let $i: \partial(\Delta^n \times I) \rightarrow V$ be the zero section. By the Hurewicz theorem, $\pi_n(H) \otimes \Lambda = 0$, and so $k'[i] = 0$ in $\pi_n(H)$ for some $k' \in \Lambda$. Again, replacing x with $k'x$, we may assume i is null-homotopic. The remainder of the proof now follows exactly as the proof of Lemma 2.1 of [14].

THEOREM 3.9. Let Σ^n be a PL Λ -homology sphere. Then Σ is stably K -parallelizable.

PROOF. Case 1. $n \not\equiv 3 \pmod{4}$.

Let $\Sigma \xrightarrow{\nu} BSH(K)$ classify the stable normal H_K -homology cobordism bundle of Σ . Since Σ bounds the contractible Λ -homology manifold $c\Sigma$, ν is null-homotopic. The obstructions to lifting this null-homotopy to $(BSPL)_K$ lie in

$$H^i(\Sigma; \pi_i(SH(K)/S\widetilde{PL}) \otimes \Lambda) = \begin{cases} 0, & i \neq n, \\ \psi_n^K \otimes \Lambda, & i = n, \end{cases}$$

by Theorem 3.6. Since $n \not\equiv 3 \pmod{4}$, $\psi_n^K \otimes \Lambda = 0$.

Case 2. $n \equiv 3 \pmod{4}$.

The argument of Case 1 shows that $\Sigma \xrightarrow{\nu} (BSG)_K$ is null-homotopic, and this null-homotopy lifts to $(BSPL)_K$ since $\pi_n(G/PL)_K = 0$.

4. The calculation of θ_n^K , $2 \notin K$. In this section, we sharpen Theorem 3.4 in the odd case.

THEOREM 4.1. Let $2 \notin K$. Then for $n \geq 4$,

$$\theta_n^K = \begin{cases} 0, & n \not\equiv 3 \pmod{4}, \\ \overline{W}(\Lambda, \mathbf{Z}) \otimes \bigoplus_{\pi(k)-1} \Lambda/\mathbf{Z}, & n = 4k - 1, \end{cases}$$

modulo the Serre class of finite K -torsion groups.

Here the $\pi(k)$ denotes the number of partitions of k .

PROOF. Let $\mathbf{T}^H$ denote the spectrum for the cobordism group $\Omega_n^{\text{fr}, K}(H)$ of stably K -parallelizable H -manifolds, $H = \text{DIFF}$ or PL . Let $\mathbf{MSH}$ be the Thom spectrum associated to $B\text{SH}_n$ and $\mathbf{S}$ the sphere spectrum.

There is a homotopy equivalence $\mathbf{T}^H/\mathbf{S} \rightarrow (\mathbf{MSH}/\mathbf{S})^{(K)}$ (compare [2, p. 85]), and we have an exact sequence

$$\begin{array}{ccccccc} 0 \rightarrow & \Omega_n^{SO} & \rightarrow & \Omega_n^{SO, \text{fr}} & \rightarrow & \Omega_{n-1}^{\text{fr}}(\text{DIFF}) & \rightarrow 0 \\ & \alpha \downarrow & & \beta \downarrow & & \gamma \downarrow & \\ 0 \rightarrow & \Omega_n^{S\text{PL}} & \rightarrow & \Omega_n^{S\text{PL}, \text{fr}} & \rightarrow & \Omega_{n-1}^{\text{fr}}(\text{PL}) & \rightarrow 0 \end{array}$$

where $\Omega_n^{SH, \text{fr}} = \pi_n(\mathbf{MSH}/\mathbf{S})$ is the cobordism group of oriented H -manifolds with framed boundaries.

By [9], γ is an isomorphism. Also, α is injective with cokernel a finite group.

Let $\mathbf{F}$ be the fiber of $\mathbf{MSO}/\mathbf{S} \rightarrow \mathbf{MSPL}/\mathbf{S}$; then $\mathbf{F}^{(K)}$ is the fiber of $\mathbf{T}^0/\mathbf{S} \rightarrow \mathbf{T}^{\text{PL}}/\mathbf{S}$. Furthermore, the map $\pi_n(\mathbf{F}^{(K)}) \rightarrow \pi_n(\mathbf{T}^0/\mathbf{S})$ is 0 for all n . This is clear if $n \not\equiv 3 \pmod{4}$, since $\pi_n(\mathbf{T}^0/\mathbf{S}) \rightarrow \pi_n(\mathbf{MSO}/\mathbf{S})$ is then injective and $\pi_n(\mathbf{F}) \rightarrow \pi_n(\mathbf{MSO}/\mathbf{S})$ is 0. If $n \equiv 3 \pmod{4}$, then we have

$$\begin{aligned} K\text{-torsion in } \Omega_{n+1}^{S\text{PL}, \text{fr}}/\Omega_{n+1}^{SO, \text{fr}} &= \pi_n(\mathbf{F}^{(K)}) \\ &\rightarrow \pi_n(\mathbf{MSO}/\mathbf{S}) \\ &= \text{coker}[\Omega_{n+1}^{SO, \text{fr}} \rightarrow (\Omega_{n+1}^{SO, \text{fr}})_K] \end{aligned}$$

which is clearly 0.

Thus we have an exact sequence

$$0 \rightarrow \pi_n(\mathbf{T}^0/\mathbf{S}) \rightarrow \pi_n(\mathbf{T}^{\text{PL}}/\mathbf{S}) \rightarrow K\text{-torsion in } \Omega_n^{S\text{PL}, \text{fr}}/\Omega_n^{SO, \text{fr}} \rightarrow 0.$$

The homotopy sequences of the pairs $(\mathbf{T}^0, \mathbf{S})$, $(\mathbf{T}^{\text{PL}}, \mathbf{S})$ now imply that there is an exact sequence

$$0 \rightarrow \Omega_n^{\text{fr}, K}(\text{DIFF}) \rightarrow \Omega_n^{\text{fr}, K}(\text{PL}) \rightarrow K\text{-torsion in } \Omega_n^{S\text{PL}, \text{fr}}/\Omega_n^{SO, \text{fr}} \rightarrow 0.$$

Consider the commutative diagram

$$\begin{array}{ccccccc} 0 \rightarrow & bP_{n+1}^K & \longrightarrow & \theta_n^K(\text{DIFF}) & \rightarrow & \Omega_n^{\text{fr}, K}(\text{DIFF}) & \\ & \downarrow & & \downarrow & & \downarrow & \\ 0 \rightarrow & L_{n+1}(1; \Lambda)/L_{n+1}(1) & \rightarrow & \theta_n^K & \longrightarrow & \Omega_n^{\text{fr}, K}(\text{PL}) & \end{array}$$

where bP_{n+1}^K is the subgroup of smooth Λ -homology spheres that bound K -parallelizable manifolds. The top row is clearly exact, and the map bP_{n+1}^K

$\rightarrow L_{n+1}(1; \Lambda)/L_{n+1}(1)$, defined by the surgery obstruction, is surjective, since the manifolds Σ_x are smooth, with kernel a finite group [1]. Again by [16],

$$L_{n+1}(1; \Lambda) \rightarrow \psi_n^K \rightarrow \mathcal{U}_{\text{PL}}^K(S^n)$$

is exact, and so

$$\ker(\theta_n^K \rightarrow \Omega_n^{\text{fr}, K}(\text{PL})) = \ker(\psi_n^K \rightarrow \mathcal{U}_{\text{PL}}^K(S^n)) = L_{n+1}(1; \Lambda)/L_{n+1}(1).$$

Thus $\theta_n^K(\text{DIFF}) \rightarrow \theta_n^K$ has cokernel a finite K -torsion group. Furthermore, by [1], there is an exact sequence

$$\theta_n(\text{DIFF}) \rightarrow \theta_n^K(\text{DIFF}) \rightarrow L_{n+1}(1; \Lambda)/L_{n+1}(1) \oplus G_n \rightarrow 0$$

where

$$G_n = \begin{cases} 0, & n \not\equiv 3 \pmod{4}, \\ \bigoplus_{\pi(k)-1} \Lambda/\mathbb{Z}, & n = 4k - 1. \end{cases}$$

Since $\theta_n(\text{DIFF}) \rightarrow \theta_n^K$ is 0, θ_n^K is given as stated.

5. The 3-dimensional case. In general, the methods of the preceding sections do not apply in dimension 3, due to the lack of a well-behaved surgery theory. In this section we investigate the Λ -homology 3-spheres obtained from the plumbing theorem and compute their fundamental groups.

We define the α_K -invariant, $2 \notin K$, as follows. Let Σ^3 be a PL Λ -homology sphere. By Lemma 2.1, there is a homomorphism $\psi_3^K \rightarrow \Omega_3^{\text{fr}, K} \cong \Lambda/\mathbb{Z}$ [2]. Thus for some integer $k \in \Lambda$, $\#_k \Sigma$ bounds a K -parallelizable manifold W . Define $k\alpha_K(\Sigma) = (1/a_K)\text{Sign}(W) \pmod{16/a_K}$. We show α_K is well defined. Suppose $\#_k \Sigma = \partial W_i$, $i = 1, 2$. Let $W = (\#_{k_1} W_2) \cup (\#_{k_2} - W_1)$ identified along the common boundary $\#_{k_1+k_2} \Sigma$. Then

$$k_1 \text{Sign}(W_2) - k_2 \text{Sign}(W_1) = \text{Sign}(W) = 0 \pmod{16} \quad \text{by [17].}$$

Let A be a symmetric integral matrix with even diagonal entries and $\det(A) \in \Lambda$. We may apply the plumbing theorem to construct a smooth manifold M_A^4 with intersection pairing A and $\Sigma_A^3 = \partial M_A^4$ a Λ -homology sphere (this is done explicitly in [11] for $K = \emptyset$). By definition of a_K , there is a matrix A as above with $\text{Sign}(A) = a_K$. Thus we have

PROPOSITION 5.1. *There is a surjection $\alpha_K: \psi_3^K \rightarrow \mathbb{Z}/(16/a_K)\mathbb{Z}$.*

We now compute $\pi_1(\Sigma_A)$ for the set of generators A of $\overline{W}(\Lambda)$ described in [4].

(1) A = the Milnor matrix: By [11],

$$\pi_1(\Sigma_A) = \langle x, y: x^3 = y^2 = (xy)^5 \rangle.$$

(2) $A = \begin{pmatrix} 2 & 1 \\ 1 & 2k \end{pmatrix}$: Let S_1, S_2 be the attaching spheres for the 2-handles of M_A , and x, y the loops indicated below:

FIGURE 1

We clearly have that $\pi_1(\Sigma_A)$ is generated by x and y , and $x^{2k} = y = xy^{-1}$. Thus $\pi_1(\Sigma_A) \cong \mathbf{Z}/(4k-1)\mathbf{Z}$.

(3) $A = \begin{pmatrix} -2 & 1 \\ 1 & 2k \end{pmatrix}$: As in (2), $\pi_1(\Sigma_A) \cong \mathbf{Z}/(4k+1)\mathbf{Z}$.

(4) $A = \begin{pmatrix} 2a & a \\ a & 2ak \end{pmatrix}$: Letting x and y be as in (2), we have

$$\pi_1(\Sigma_A) \cong \langle x, y : x^{2ak} = y^a, y^{2a} = x^a \rangle \cong \mathbf{Z}/(4k-1)a\mathbf{Z}.$$

(5)

$$A = \begin{bmatrix} 2 & 1 & 0 & 1 \\ 1 & 2 & 1 & 0 \\ 0 & 1 & 2 & 1 \\ 1 & 0 & 1 & 2k \end{bmatrix}:$$

Let S_1, S_2, S_3, S_4 be the attaching spheres and x, y as indicated:

FIGURE 2

Then $\pi_1(\Sigma_A) \cong \langle x, y : x^{4k} = y, y^2 = x^3 \rangle \cong \mathbf{Z}/(8k-3)\mathbf{Z}$.

EXAMPLE. Let $p = 4k - 1$ be a prime and M^3 the rational homology sphere obtained by intersecting the unit 5-sphere in $\mathbb{C}^3$ with algebraic variety defined by $z_1^2 + z_2^2 + z_3^2 = 0$. The origin is an isolated singularity of this variety and its minimal resolution has the $(p - 1) \times (p - 1)$ intersection matrix

$$A = \begin{bmatrix} -2 & 1 & & & & \\ 1 & -2 & 1 & & & \\ & 1 & & & & \\ & & & \ddots & & \\ & & & & \ddots & \\ & \bigcirc & & & & -2 & 1 \\ & & & & & 1 & -2 \end{bmatrix}$$

which can be diagonalized as $\langle -2, -3/2, -4/3, \dots, -p/(p - 1) \rangle$. Thus $\text{Sign}(A) = -p + 1$, $\beta_p(A) = \langle -(p - 1) \rangle = 1$, $\beta_{p'}(A) = 0$, $p' \neq p$. It follows that $M \cong (\#_n \Sigma_1) \neq \Sigma_2$, where Σ_1 is the manifold of (1) above, Σ_2 the manifold of (2) (with orientations reversed) and $n = [k/2]$.
