EXPANSIVE HOMEOMORPHISMS AND TOPOLOGICAL DIMENSION

BY

RICARDO MAÑÉ

ABSTRACT. Let K be a compact metric space. A homeomorphism $f: K \rightarrow K$ is expansive if there exists $\epsilon > 0$ such that if $x, y \in K$ satisfy $d(f^n(x), f^n(y)) < \epsilon$ for all $n \in \mathbb{Z}$ (where $d(\cdot, \cdot)$ denotes the metric on K) then $x = y$. We prove that a compact metric space that admits an expansive homeomorphism is finite dimensional and that every minimal set of an expansive homeomorphism is 0-dimensional.

A homeomorphism f of a compact metric space K is expansive if there exists $c > 0$ (called an expansivity constant for f) such that $d(f^n(x), f^n(y)) < c$ for all n implies $x = y$. This property has frequent applications in stability theory, symbolic dynamics and ergodic theory. Specially interesting are expansive homeomorphisms of 0-dimensional spaces because they can be embedded in shifts, or, in other words, they are equivalent to subshifts. In [1] Bowen proved that hyperbolic minimal sets of diffeomorphisms are 0-dimensional. Since the restriction of a diffeomorphism to a hyperbolic set is always expansive, it is natural to ask whether minimal sets of expansive homeomorphisms are 0-dimensional. The purpose of this paper is to prove this property.

THEOREM. *If $f: K \rightarrow K$ is an expansive homeomorphism of the compact metric space K then $\dim K < \infty$ and every minimal set of f is 0-dimensional.*

Recall that a compact metric space has dimension $\leq n$ if for all $r > 0$ there exists a covering $\mathcal{U}$ of K by open sets with diameter $< r$ such that every point belongs to at most $n + 1$ sets of $\mathcal{U}$ [2]. Moreover it is known [2] that K is 0-dimensional if and only if it is totally disconnected i.e. if the connected component of every point x is $\{x\}$.

Let us see an application of the theorem to the symbolic dynamics of an expansive homeomorphism $f: K \rightarrow K$. Let $\mathcal{U} = \{U_1, \dots, U_k\}$ be a covering of K by open sets with diameter smaller than an expansivity constant c of f . Let $\Sigma(f, \mathcal{U})$ be the subshift associated to f and $\mathcal{U}$ i.e. the set of sequences $\theta: \mathbb{Z} \rightarrow \mathcal{U}$ such that $\bigcap_{n=-\infty}^{+\infty} f^{-n}(\bar{\theta}_n) \neq \emptyset$. Endow $\Sigma(f, \mathcal{U})$ with the topology induced by the space $\mathcal{U}^{\mathbb{Z}}$. Then $\Sigma(f, \mathcal{U})$ is compact and since the diameter of the sets in $\mathcal{U}$ is smaller than c we have a continuous map $\pi: \Sigma(f, \mathcal{U}) \rightarrow K$

defined by $\pi(\theta) = \cap_{n=0}^{\infty} f^{-n}(\bar{\theta}_n)$. Moreover if $\sigma: \Sigma(f, \mathcal{U}) \leftrightarrow$ is the shift homeomorphism we have $f\pi = \pi\sigma$.

COROLLARY. *If $\Delta \subset K$ is a minimal set for f then $\pi^{-1}(\Delta)$ contains a minimal set Λ_0 that is mapped homeomorphically onto Δ by π .*

To prove the Corollary take a covering of Λ by disjoint open sets in Λ , $\tilde{\mathcal{U}} = \{V_1, \dots, V_l\}$ with diameters so small that there exists a function $\varphi: \tilde{\mathcal{U}} \rightarrow \mathcal{U}$ with the property $\varphi(V_i) \supset V_i$ for all i . Consider the subshift $\Sigma_1 = \Sigma(f/\Lambda, \tilde{\mathcal{U}})$ associated to f/Λ and $\tilde{\mathcal{U}}$ and the maps $\tilde{\pi}: \Sigma_1 \rightarrow \Lambda$ defined by $\tilde{\pi}(\theta) = \cap_{n=0}^{\infty} f^{-n}(\bar{\theta}_n)$ and $\tilde{\varphi}: \Sigma_1 \rightarrow \Sigma(f, \mathcal{U})$ defined by $\tilde{\varphi}(\theta) = \varphi \circ \theta$. Now $\tilde{\pi}$ is a homeomorphism because the sets in $\tilde{\mathcal{U}}$ are disjoint and we have $\pi\tilde{\varphi} = \tilde{\pi}$, $\sigma\tilde{\varphi} = \tilde{\varphi}\sigma$, where σ also denotes the shift homeomorphism of Σ_1 . Since $\tilde{\pi}$ is a homeomorphism then $\sigma: \Sigma_1 \leftrightarrow$ is a minimal homeomorphism (because $f\tilde{\pi} = \tilde{\pi}\sigma$). Hence $\tilde{\varphi}(\Sigma_1)$ is a minimal set for $\sigma: \Sigma(f, \mathcal{U}) \leftrightarrow$ and $\pi\tilde{\varphi}(\Sigma_1) = \tilde{\pi}\Sigma_1 = \Lambda_1$. Finally $\pi/\tilde{\varphi}(\Sigma_1)$ is one-to-one because $\pi\tilde{\varphi}(\theta) = \pi\tilde{\varphi}(\theta')$ implies $\tilde{\pi}(\theta) = \tilde{\pi}(\theta')$ and then $\theta = \theta'$.

1. The dimension of minimal sets. Let K be a compact metric space, with metric $d(\cdot, \cdot)$ and $f: K \rightarrow K$ an expansive homeomorphism with expansivity constant $c > 0$. In this section we shall assume that $\dim K > 0$ and we shall prove that f cannot be a minimal homeomorphism.

If $\varepsilon > 0$ and $x \in K$, let $W_\varepsilon^s(x)$, $W_\varepsilon^u(x)$ be the local stable and unstable sets defined by:

$$W_\varepsilon^s(x) = \{y \in K \mid d(f^n(x), f^n(y)) < \varepsilon \forall n \geq 0\},$$

$$W_\varepsilon^u(x) = \{y \in K \mid d(f^{-n}(x), f^{-n}(y)) < \varepsilon, \forall n \geq 0\}.$$

Fix $0 < \varepsilon < c/2$.

The idea of the proof is the following: using the expansiveness we show that for some $x \in K$ there exists a compact connected set $\Lambda_0 \subset W_\varepsilon^s(x)$ with $\text{diam}(\Lambda_0) = c > 0$. Then we prove that some power f^{-m} of f expands every compact connected set Λ with $\text{diam}(\Lambda) = c$ contained in a local stable set. More precisely $\text{diam } f^{-m}(\Lambda) > 3c$. Using this we show that $f^{-m}(\Lambda)$ contains two compact connected sets Λ' , Λ'' , contained in local stable sets, with $\text{diam}(\Lambda') = \text{diam}(\Lambda'') = c$ and satisfying $\inf\{d(x, y) \mid x \in \Lambda', y \in \Lambda''\} > c/2$. This property contradicts the minimality of f^m because if we take an open set U with $\text{diam}(U) < c/2$ then either Λ'_0 or Λ''_0 (where Λ'_0 , Λ''_0 are related to Λ_0 as Λ' , Λ'' to Λ in the previous explanation) does not intersect U . Suppose $\Lambda'_0 \cap U = \emptyset$. Define $\Lambda_1 = \Lambda'_0$. Again Λ'_1 or Λ''_1 does not intersect U . Suppose $\Lambda' \cap U = \emptyset$ and define $\Lambda_2 = \Lambda'_1$. Using this method we find $\Lambda_0, \Lambda_1, \dots$ such that $f^{-m}(\Lambda_j) \supset \Lambda_{j+1}$ and $\Lambda_j \cap U = \emptyset$. Let $x \in \cap_{j \geq 0} f^{jm}(\Lambda_j)$. Then the backwards orbit of x under f^m does not intersect U ; hence K is not minimal for f^m . In order to prove that K is not minimal for f we shall follow the same

idea being more careful in the choice of U in order to make possible the construction of the sequence Λ_j satisfying $f^{-i}(\Lambda_j) \cap U = \emptyset$ for all $0 \leq i \leq m$. The existence of the initial set Λ_0 is proved in Lemma III and the expanding property in Lemma IV.

LEMMA I. For all $r > 0$ there exists $N > 0$ such that

$$f^n(W_\varepsilon^s(x)) \subset W_r^s(f^n(x)), \quad f^{-n}(W_\varepsilon^u(x)) \subset W_r^u(f^{-n}(x))$$

for all $x \in K$, $n \geq N$.

PROOF. If the lemma is false we can find sequences $x_n, y_n \in K$, $m_n > 0$ such that $y_n \in W_\varepsilon^s(x_n)$, $\lim m_n = +\infty$ and $d(f^{m_n}(x_n), f^{m_n}(y_n)) > r$. Since $y_n \in W_\varepsilon^s(x_n)$ we have $d(f^n(f^{m_n}(x_n)), f^n(f^{m_n}(y_n))) \leq \varepsilon$ for all $-m_n \leq n$. Then if $x_n \rightarrow x$, $y_n \rightarrow y$ when $n \rightarrow +\infty$ we obtain that $d(f^n(x), f^n(y)) \leq \varepsilon$ for all $n \in \mathbb{Z}$. Moreover $d(x, y) = \lim d(f^{m_n}(x_n), f^{m_n}(y_n)) > r$ thus contradicting the expansivity.

Now define the stable and unstable sets $W^s(x)$, $W^u(x)$ as

$$W^s(x) = \bigcup_{n \geq 0} f^{-n}(W_\varepsilon^s(f^n(x))), \quad W^u(x) = \bigcup_{n \geq 0} f^n(W_\varepsilon^u(f^{-n}(x))).$$

By Lemma I we have:

$$W^s(x) = \{y \in K \mid \lim_{n \rightarrow +\infty} d(f^n(x), f^n(y)) = 0\},$$

$$W^u(x) = \{y \in K \mid \lim_{n \rightarrow +\infty} d(f^{-n}(x), f^{-n}(y)) = 0\}.$$

LEMMA II. If for some $x \in K$ and $m > 0$ we have $f^m(W^s(x)) \cap W^u(x) \neq \emptyset$ then K contains a periodic point.

PROOF. Suppose $f^m(W^s(x)) \cap W^u(x) \neq \emptyset$. Take $y \in W^s(x) \cap f^m(W^s(x))$. Let $z = f^{-m}(y)$. Then $f^m(z) \in W^s(x) = W^s(z)$. Therefore $\lim_{n \rightarrow \infty} d(f^n(f^m(z)), f^n(z)) = 0$. Suppose that for some subsequence m_n we have that $f^{m_n}(z)$ converges to some $w \in K$. Then

$$\begin{aligned} d(w, f^m(w)) &= \lim d(f^m(f^{m_n}(z)), f^{m_n}(z)) \\ &= \lim d(f^{m_n}(f^m(z)), f^{m_n}(z)) = 0. \end{aligned}$$

Define $\Sigma_\delta^s(x)$, $\Sigma_\delta^u(x)$ as the connected components of x in $W_\varepsilon^s(x) \cap B_\delta(x)$ and $W_\varepsilon^u(x) \cap B_\delta(x)$ respectively, where $B_\delta(x) = \{y \mid d(y, x) \leq \delta\}$. Let $S_\delta(x) = \{y \mid d(y, x) = \delta\}$.

LEMMA III. There exists $\varepsilon > r > 0$ such that if $0 < \delta < r$ there exists $a \in K$ such that $\Sigma_\delta^s(a) \cap S_\delta(a) \neq \emptyset$ or $\Sigma_\delta^u(a) \cap S_\delta(a) \neq \emptyset$.

PROOF. Let $\Sigma_r(x)$ be the connected component of x in $B_r(x)$. Since $\dim K > 0$ we can find $x \in K$ and $r > 0$ such that $\Sigma_r(x) \cap S_r(x) \neq \emptyset$. If $0 < \delta < r$ it follows that $\Sigma_\delta(x) \cap S_\delta(x) \neq \emptyset$. Suppose that for some $0 < \delta < r$ we have $\Sigma_\delta^u(y) \cap S_\delta(y) = \emptyset$ for all y . We shall prove that there exists

$a \in K$ such that $\Sigma_\delta^s(a) \cap S_\delta(a) \neq \emptyset$. To find a we shall construct a family of compact connected sets Λ_n , $n \geq 0$, and a sequence of points $x_n \in \Lambda_n$ such that for some sequence of integers $m_n > 0$ they satisfy the following conditions:

- (1) $f^{-m_n}(x_n) = x_{n+1}$;
- (2) $f^{-m_n}(\Lambda_n) \supset \Lambda_{n+1}$;
- (3) $\Lambda_n \cap S_\delta(x_n) \neq \emptyset$;
- (4) $f^n(\Lambda_n) \subset B_\varepsilon(f^n(x_n))$ if $0 \leq n \leq m_{n-1}$.

Once the sets Λ_n are constructed the lemma follows easily taking $a = \lim x_n$ and defining Λ as the set of points $y \in K$ such that $y = \lim y_n$ for some sequence $y_n \in \Lambda_n$. Then Λ is connected and from (4) follows that $\Lambda \subset W_\varepsilon^s(a)$. By (3) $\Lambda \cap S_\delta(a) \neq \emptyset$. Hence the connected component of a in Λ intersects $S_\delta(a)$. Therefore the same thing is true for $\Sigma_\delta^s(a)$ because $\Lambda \subset W_\varepsilon^s(a)$. To construct the sets Λ_n start taking $\Lambda_0 = \Sigma_\delta(x)$. Suppose $\Lambda_0, \Lambda_1, \dots, \Lambda_{n-1}$ is constructed. If $\tilde{\Lambda}_{n-1}$ is the connected component of x_{n-1} in $B_\delta(x_{n-1}) \cap \Lambda_{n-1}$ then

$$\tilde{\Lambda}_{n-1} \cap S_\delta(x_{n-1}) \neq \emptyset$$

(because Λ_{n-1} is connected) and $\tilde{\Lambda}_{n-1}$ cannot be contained in $W_\varepsilon^u(x_{n-1})$. Hence there exists $y \in \tilde{\Lambda}_{n-1} \setminus W_\varepsilon^u(x_{n-1})$. Then for some $m > 0$ we have

$$\sup\{d(f^{-m}(z), f^{-m}(x_{n-1})) \mid z \in \tilde{\Lambda}_{n-1}\} > d(f^{-m}(y), f^{-m}(x_{n-1})) > \varepsilon$$

and we can suppose that:

$$\sup\{d(f^{-j}(z), f^{-j}(x_{n-1})) \mid z \in \tilde{\Lambda}_{n-1}, 0 \leq j < m\} \leq \varepsilon. \quad (0)$$

Let Λ_n be the connected component of $x_n = f^{-m}(x_{n-1})$ in $B_\delta(x_n) \cap f^{-m}(\tilde{\Lambda}_{n-1})$. Since $f^{-m}(\tilde{\Lambda}_{n-1})$ is connected we obtain that $\Lambda_n \cap S_\delta(x_n) \neq \emptyset$ thus proving (3). From (0) follows that Λ_n satisfies (4).

LEMMA IV. For all $0 < \delta < \varepsilon$ there exists $N > 0$ such that for all $x \in K$ and $y \in W_\varepsilon^s(x)$ with $d(y, x) = \delta$ there exists $0 < n \leq N$ satisfying

$$d(f^{-n}(y), f^{-n}(x)) > \varepsilon.$$

PROOF. If the lemma were false there would exist sequences $x_n \in K$, $y_n \in W_\varepsilon^s(x_n)$ such that $d(x_n, y_n) = \delta$ and if $j \leq n$, $d(f^{-j}(x_n), f^{-j}(y_n)) \leq \varepsilon$. Then if $x_n \rightarrow x$, $y_n \rightarrow y$ it is easy to check that $x \neq y$ and $d(f^n(x), f^n(y)) \leq \varepsilon$ for all $n \in \mathbb{Z}$.

LEMMA V. There exists $\delta_0 > 0$ such that $W_\varepsilon^s(x) \cap B_\delta(x) = W_{2\varepsilon}^s(x) \cap B_\delta(x)$ for all $x \in K$, $0 < \delta < \delta_0$.

PROOF. If the lemma is false there exist sequences $x_n, y_n \in K$ such that $d(x_n, y_n) \rightarrow 0$, and $y_n \in W_{2\varepsilon}^s(x_n)$. Hence for some $m_n > 0$ we must have $d(f^{m_n}(x_n), f^{m_n}(y_n)) > \varepsilon$ and $m_n \rightarrow +\infty$. We also have $d(f^n(f^{m_n}(x_n)),$

$f^n(f^{m_n}(y_n))) \leq 2\varepsilon$ for all $-m_n \leq m$, because $y_n \in W_{2\varepsilon}^s(x_n)$. Then if $f^{m_n}(x_n) \rightarrow x$ and $f^{m_n}(y_n) \rightarrow y$ when $n \rightarrow +\infty$ we conclude that $d(x, y) \geq \varepsilon$ and $d(f^m(x), f^m(y)) \leq 2\varepsilon$ for all $m \in \mathbb{Z}$ thus contradicting the expansivity of f .

Now define the constant $\bar{\varepsilon} = \inf\{d(x, y) | d(f^{-1}(x), f^{-1}(y)) > \varepsilon\}$.

LEMMA VI. For all $0 < \delta < \min(\delta_0, \bar{\varepsilon}/3)$ (where δ_0 is given by Lemma V) there exists $N = N(\delta) > 0$ such that if $x \in K$ and $\Lambda \subset W_\varepsilon^s(x)$ is a compact connected set containing x and intersecting $S_\delta(x)$ then there exist $0 < m < N$, points $\alpha, \beta \in f^{-m}(\Lambda)$ and compact connected sets $\Lambda_\alpha, \Lambda_\beta$ satisfying:

- (a) $\alpha \in \Lambda_\alpha, \beta \in \Lambda_\beta, \alpha \in W_{2\varepsilon}^s(\beta)$;
- (b) $\Lambda_\alpha \cap S_\delta(\alpha) \neq \emptyset, \Lambda_\beta \cap S_\delta(\beta) \neq \emptyset$;
- (c) $\inf\{d(z, w) | z \in B_\delta(\alpha), w \in B_\delta(\beta)\} > \delta$;
- (d) $\Lambda_\alpha \subset W_\varepsilon^s(\alpha) \cap B_\delta(\alpha), \Lambda_\beta \subset W_\varepsilon^s(\beta) \cap B_\delta(\beta)$.

PROOF. Take $N = N(\delta)$ given by Lemma IV. Since $S_\delta(x) \cap \Lambda \neq \emptyset$, by Lemma IV there exists $0 \leq m < N$ such that

$$\sup\{d(f^{-(m+1)}(z), f^{-(m+1)}(x)) | z \in \Lambda\} > \varepsilon$$

and we can suppose:

$$\sup\{d(f^{-j}(z), f^{-j}(x)) | x \in \Lambda, 0 \leq j < m\} < \varepsilon.$$

Hence $f^{-m}(\Lambda) \subset W_\varepsilon^s(f^{-m}(x))$ and then:

$$f^{-m}(\Lambda) \subset W_{2\varepsilon}^s(w) \quad (1)$$

for all $w \in f^{-m}(\Lambda)$. Moreover by the definition of $\bar{\varepsilon}$ we have $\text{diam } f^{-m}(\Lambda) < \bar{\varepsilon}$. Then we can find points $\alpha, \beta \in f^{-m}(\Lambda)$ such that $B_\delta(\alpha), B_\delta(\beta)$ satisfy (c) (here is used the property $3\delta < \bar{\varepsilon}$). Let $\Lambda_\alpha, \Lambda_\beta$ be the connected components of α and β in $f^{-m}(\Lambda) \cap B_\delta(\alpha), f^{-m}(\Lambda) \cap B_\delta(\beta)$ respectively. Since $f^{-m}(\Lambda)$ is connected, contains α and β , and $\alpha \notin B_\delta(\beta), \beta \notin B_\delta(\alpha)$, it follows that $\Lambda_\alpha, \Lambda_\beta$ satisfy (b). By (1) α and β satisfy (a) and $\Lambda_\alpha \subset B_\delta(\alpha) \cap W_{2\varepsilon}^s(\alpha), \Lambda_\beta \subset B_\delta(\beta) \cap W_{2\varepsilon}^s(\beta)$. Hence, by Lemma V, $\Lambda_\alpha, \Lambda_\beta$ satisfy (d).

Now we are ready to prove that f cannot be a minimal homeomorphism. Take $0 < \delta < \min(\delta_0, \bar{\varepsilon}/3, r)$ (r given by Lemma III) and define:

$$r_1 = \inf\{d(f^j(x), f^i(y)) | x \in W_{4\varepsilon}^s(y), d(x, y) > \delta, \\ 0 \leq j < N(\delta), 0 \leq i < N(\delta)\}$$

where $N(\delta)$ is as in Lemma VI. Using Lemma II it is easy to see that this number is positive, otherwise we should have sequences $x_n, y_n \in K, n \geq 0, y_n \in W_{4\varepsilon}^s(x_n), d(x_n, y_n) > \delta, 0 \leq j_n \leq i_n < N(\delta)$ such that $d(f^{j_n}(x_n), f^{i_n}(y_n)) \rightarrow 0$ when $n \rightarrow +\infty$. We can suppose that $x_n \rightarrow x, y_n \rightarrow y$ when $n \rightarrow +\infty$ and that $j_n = j, i_n = i$ for all $n \geq 0$. Then $y \in W_{4\varepsilon}^s(x), d(y, x) > \delta$ and $f^j(x) = f^i(y)$. Hence $j \neq i$ and $f^{j-i}(W^s(x)) \cap W^s(x) \neq \emptyset$. This, by Lemma II, implies that K contains a periodic point. So we can assume $r_1 > 0$. We shall show that $r_1 > 0$ also contradicts the minimality of K by showing the

existence of an open set U and a point p such that $f^n(p) \notin U$ for all $n \geq 0$.

First we construct a family of compact connected sets Λ_n , $n \geq 0$, a sequence of points $x_n \in \Lambda_n$ and an open set $U \subset K$ such that:

- (a) $\Lambda_n \cap S_\delta(x_n) \neq \emptyset$;
- (b) $\Lambda_n \subset W_\varepsilon(x_n)$;
- (c) For some $0 < m_n < N(\delta)$, $f^{-m_n}(\Lambda_n) = \Lambda_{n+1}$;
- (d) $f^{-j}(\Lambda_n) \cap U = \emptyset$ for all $0 \leq j \leq m_n$.

By Lemma III we can suppose that $\Sigma_\delta^s(a) \cap S_\delta(a)$ for some $a \in K$ (because $\delta < r$). Define $x_0 = a$, $\Lambda_0 = \Sigma_\delta^s(a)$ and take an open set U with diameter $< r/2$, and $U \cap \Lambda_0 = \emptyset$. Suppose that we constructed $\Lambda_0, \Lambda_1, \dots, \Lambda_{n-1}$. To find Λ_n we apply Lemma VI obtaining two compact connected sets $\Lambda_\alpha, \Lambda_\beta$ such that defining Λ_n as one of them, properties (a), (b), (c) would be satisfied. In order to satisfy condition (d) observe that by the definition of r_1 and the fact that the diameter of U is $< r_1/2$ then if $U \cap (\bigcup_{j=0}^m f^{-j}(\Lambda_\alpha)) \neq \emptyset$ (m being the number given in Lemma VI) then $U \cap (\bigcup_{j=0}^m f^{-j}(\Lambda_\beta)) = \emptyset$ and we chose $\Lambda_n = \Lambda_\beta$. Finally define $p = \bigcap_{n \geq 0} f^{-N_n}(\Lambda_n)$ where $N_n = \sum_{j=0}^n m_j$. Clearly $f^n(p) \notin U$ for all $n \geq 0$, thus proving that K is not minimal.

2. The dimension of K . Let f, K be as in §1. Here we shall prove that $\dim K < \infty$. Let, as in §1, $c > 0$ be an expansivity constant for f . Fix $0 < \varepsilon < c/2$.

LEMMA. *There exists $\delta > 0$ such that if $x, y \in K$, $d(x, y) < \delta$, and for some $n > 0$ satisfy $\varepsilon \leq \sup\{d(f^j(x), f^j(y)) \mid 0 \leq j \leq n\} < 2\varepsilon$, then $d(f^n(x), f^n(y)) > \delta$.*

PROOF. If this property is false we can find sequences $x_n, y_n \in K$, $m_n > l_n > 0$ such that $d(x_n, y_n) \rightarrow 0$, $d(f^{m_n}(x_n), f^{m_n}(y_n)) \rightarrow 0$, $d(f^{l_n}(x_n), f^{l_n}(y_n)) \geq \varepsilon$ and $\sup\{d(f^m(x_n), f^m(y_n)) \mid 0 \leq m \leq m_n\} < 2\varepsilon$. Suppose that $f^{l_n}(x_n) \rightarrow x$ and $f^{l_n}(y_n) \rightarrow y$. Then $d(x, y) \geq \varepsilon$ and $d(f^n(x), f^n(y)) \leq 2\varepsilon$ for all $n \in \mathbb{Z}$.

LEMMA II. *For all $\rho > 0$ there exists $N = N(\rho)$ such that $d(x, y) \geq \rho$ implies that $\sup\{d(f^n(x), f^n(y)) \mid |n| \leq N\} > \varepsilon$.*

PROOF. If the property is false there exist sequences $x_n, y_n \in K$ with $d(x_n, y_n) \geq \rho$ and such that $\sup\{d(f^j(x), f^j(y)) \mid |j| \leq n\} \leq \varepsilon$. Then if $x_n \rightarrow x$, $y_n \rightarrow y$, we obtain $d(x, y) \geq \rho$ and $d(f^n(x), f^n(y)) \leq \varepsilon$ for all $n \in \mathbb{Z}$.

To prove that $\dim K < \infty$ take a covering $\{U_i \mid 1 \leq i \leq l\}$ of K by open sets with diameter $\leq \delta$, δ as in Lemma I. We claim that $\dim(K) \leq l^2 - 1$. To prove this for each $n \geq 0$ choose $\delta_n > 0$ such that $d(x, y) < \delta_n$ implies $d(f^j(x), f^j(y)) < \varepsilon$ for all $|j| \leq n$. Let $U_{i,j}^n = f^n(U_i) \cap f^{-n}(U_j)$ and let $U_{i,j}^{n,k}$, $1 \leq k \leq k(i, j, n)$, be the δ_n -components of $U_{i,j}^n$, i.e. the equivalence classes of $U_{i,j}^n$ under the relation $x \sim y$ if there exists a sequence $x = x_0, x_1, \dots, x_p = y$

such that $d(x_r, x_{r+1}) < \delta_n$ for all $0 < r < p - 1$ and $x_r \in U_{ij}^n$ for all $0 < r < p$. Observe that the sets $U_{ij}^{n,k}$ are open and cover K . We have that:

$$\lim_{n \rightarrow +\infty} \left(\sup_{k,i,j} \text{diam } U_{ij}^{n,k} \right) = 0 \quad (2)$$

because otherwise we could find $\rho > 0$ and large values of n , say $n > 2N(\rho)$, $N(\rho)$ given by Lemma II, such that in some $U_{ij}^{n,k}$ there exist x, y with $d(x, y) > \rho$. Let $x = x_0, x_1, \dots, x_p = y$ a sequence in U_{ij}^n such that $d(x_r, x_{r+1}) < \delta_n$ for all $0 < r < p$. Define $S_r = \sup\{d(f^m(x_r), f^m(x_0)) \mid |m| < n\}$. By Lemma II $S_p > \varepsilon$ and by the choice of δ_n $S_1 < \varepsilon$ and $|S_{r+1} - S_r| < \varepsilon$ for $1 < r < p$. Take r such that $s_{r'} < \varepsilon$ if $r' < r$ and $s_r > \varepsilon$. Then $s_r < 2\varepsilon$. Therefore the points $x = x_0$ and x_r satisfy $d(f^{-n}(x), f^{-n}(x_r)) < \delta$ because $f^{-n}(x), f^{-n}(x_r)$ belong to U_i , and $d(f^n(x), f^n(x_r)) < \delta$ because $f^n(x), f^n(x_r)$ belong to U_j , and $\varepsilon < s_r = \sup\{d(f^m(x), f^m(x_r)) \mid |m| < n\} < 2\varepsilon$ thus contradicting Lemma I. Then (2) is proved and it remains to show only that for each n , every point of K belongs at most to l^2 sets of the covering $\{U_{ij}^{n,k} \mid 1 \leq i \leq l, 1 \leq j \leq l, 1 \leq k \leq k(i, j)\}$. Suppose that $\bigcap \{U_{i_m j_m}^{n, k_m} \mid 1 \leq m \leq s\} \neq \emptyset$. Then $(i_m, j_m) = (i_{\bar{m}}, j_{\bar{m}})$ implies that $U_{i_m j_m}^{n, k_m} = U_{i_{\bar{m}} j_{\bar{m}}}^{n, k_{\bar{m}}}$ because they are both δ_n -components of $U_{i_m j_m}^n$ and have nonempty intersection.

This means that to different values of m correspond different values of the couple (i_m, j_m) . Therefore $s \leq m^2$.
